Toward an Encyclopedia of Renaissance Philosophy

The aim of the *Encyclopedia of Renaissance Philosophy* (ERP) is to provide scholars with an easy-access reference work that gives accurate and reliable summaries of the current state of research. It includes entries on philosophers, problems, terms, historical periods, subjects, and the cultural context of Renaissance philosophy. Furthermore, it covers Latin, Arabic, Jewish, Byzantine, and vernacular philosophy, as well as featuring entries on the cross-fertilization of these philosophical traditions.

The approach adopted for the ERP blends the methodologies of intellectual history and the history of problems. The basic principle underpinning the ERP is that the best method for understanding Renaissance philosophy is to investigate the *translatio studiorum* as an act that is fully implicit in the most rudimentary communication and fully explicit in the coexistence and interaction of knowledge, languages, and cultures. Looking at Renaissance philosophy from the point of view of the *translatio studiorum* means emphasizing the breakthroughs, the resistance, and the transformation of language, concepts, and problems within specific traditions. Understandings and misunderstandings of Renaissance literature, philosophy, art, religion, and science have come to shape European cultures and help shape other civilizations. As George Steiner pointed out in *After Babel*, every culture has come to be by means of a continuous translation and rewriting of preceding meanings – a sequence of translations and transformations – and it is no wonder then that the very notion of “Renaissance” is historically associated with the translation of texts and traditions that had gone astray during the early Middle Ages. The rediscovery of Greek, Latin, Arabic, and Hebrew texts found its place within a reinvented continuity comprising translations, transcriptions, and interpretations, entailing the passage from one culture to another and in which new philosophical problems, concepts, and ideas came to be born.

But working on philosophical problems, ideas, and concepts in their transmission means equally also to understand that they are not only the subjects of philosophical disciplines strictly defined. Few epochs in the same ways as the Renaissance have seen philosophical problems tackled by people of different levels of culture and varying degrees of expertise and knowledge. For instance, the problem of “perspective” was addressed by painters, architects, and artisans, not merely by philosophers. Renaissance philosophy is essentially interdisciplinary pursuit. It is therefore necessary in this context to reflect on the philosophical issues of a variety of disciplines, including architecture, painting, religion, literature, etc., and on their interconnections with philosophy.

The claim that there exists a “pure philosophy” of the Renaissance is untenable.

Being editor of an encyclopedia goes well beyond solving practical problems such as the coordination of more than 600 scholars, with more or less efficiency. First and foremost is the need to tackle the fundamental theoretical issue of how to write history. In this specific case, we are confronted with a string of fundamental questions such as: “what is the Renaissance?”, “what is Renaissance philosophy?”, “is there such a thing as Renaissance philosophy?”, “what are the main connections between the ideas of the Renaissance and other historical periods or intellectual movements?”. Many scholars have provided answers to these questions, establishing a priori what “philosophy,” “Renaissance,” and “humanism” were, and then proceeded to determine whether a particular author, idea, or movement might be included under this label or not. The ERP aims to offer a valid alternative to these approaches.

Starting from the nineteenth century, one of the most important historiographical issues was to characterize what the Renaissance was. Did it exist? What was it? In his *The Lost Renaissance* Chris Celenza has recently reaffirmed that “no one could deny that there were groups of early modern thinkers who believed they were living in a time of cultural rebirth” (Celenza 2001, xvii). But to what extent? Is it a period of Western history or a movement? Ernst Gombrich has explicitly argued that the Renaissance had all the characteristics of a movement which may be understood as a recovery or revival of classical antiquity or values with a core of dedicated souls surrounded by a crowd of hangers-on (Gombrich 1979). Erwin Panofsky also maintained that from the fourteenth to the sixteenth century Renaissance scholars were convinced that their period was a new age as sharply differentiated from the medieval past as the medieval past had been from classical antiquity, and marked by a concerted effort to revive the culture of the latter (Panofsky 1969, 38). This widespread insight into the peculiar character and physiognomy of the Renaissance is no doubt supported by a great deal of textual evidence and historical proof (Kohl 1992). Nonetheless, there have been several recent detailed studies – among them, those of Robert Black – that have questioned whether the Renaissance was a coherent and well-defined movement as opposed to something hybrid (Black 2005). Furthermore, conceiving of the Renaissance as a movement entails the no less slippery assumption that whoever proclaimed the importance of the revival postulated also that something dead had had to be reborn, and that the period responsible for this death was the Middle Ages (Gombrich 1974), leading to the long-standing controversy around periodization (Cantimori 1959, 340–378).

In order to solve this problem, from the Second World War onward the scholarship has tightly linked the challenge of defining the Renaissance to that of defining “humanism,” because – in Jim Hankins’s words – if all the cultural products of an age are an expression of a shared vision of the world, humanism was the vision of the world of the Renaissance (Hankins 2005, 73). But new questions quickly arise: What was humanism? Was it philosophy? Or rather, was it only a literary movement? Was it a reawakening of the human spirit, a

new view on the nature of the human being? Was it a revival of paganism or a new way of conceiving Christianity? Eugenio Garin and Paul Oskar Kristeller – the two most important twentieth-century interpreters of Renaissance humanism – offered two apparently oppositional solutions. The former argued that Italian Renaissance humanism was – in being a fundamentally new way of thinking – a new philosophy. It was a movement whose essence was determined by its philological attitude toward the past, and this attitude concerns the understanding of the ancients and enabling them flourish within their own historical environment. And it is precisely this philological attitude that constitutes the new philosophy, or rather the new method of posing problems, which is itself for Garin effectively philosophizing. Humanism as a whole was not only literary but also philosophical in content, breaking with the traditions of medieval philosophy and playing key role in the pre-history of modern thought. Furthermore, for Garin, humanism consisted in a renewed confidence in man and his possibilities, and in an enriched appreciation of man's activity in every possible sense, especially in civic life (Hankins 1995). But recent studies – see, for instance, the collections of essays edited by Hankins 2004 – have shown that any particular opinion expressed by a humanist is by no means shared by all of them, or even consistently held by the same writers – even the attractive idea of civic humanism was largely limited to Florence and prevailed for only a relatively short period of time.

On the other side, for Kristeller, humanism was strictly connected with the activity of the schools and universities and with an educational program comprising the five disciplines of grammar, rhetoric, poetry, history, and moral philosophy (Kristeller 1944–45, 365; Kohl 1992, 185; Celenza 2001, 42). He was aware that humanism implies a new intellectual stance and program of study, but in his view it covered an attitude of the mind that had existed long before, without philosophical allegiance. Humanism was not a philosophical movement according to Kristeller: in fact, humanists neither shared an identifiable political ideology (Hankins 2020) nor a certain activist view of the world and place of man within it, nor certain religious or anti-religious views, nor even the desire to surpass the ancients. They merely shared a commitment to the five above-mentioned disciplines (Celenza 2001, 43; Hankins 2001; Hankins 2002; Hankins 2005; Hankins 2011). Humanists were not philosophers. Humanism was essentially a literary movement concerned with the *studia humanitatis* (Monfasani 2000).

Each of Garin and Kristeller's approaches possess their own strengths and led, in turn, to other seminal historical research. Garin seems to defend an arbitrary and aprioristic position – since “humanism” never existed as whole and unique movement, but there existed only humanists and *studia humanitatis* (Campana 1946). On the other hand, as Jill Kraye has elegantly argued, it is necessary to overcome the dichotomy between humanist and philosopher (Kraye 2016). A humanist could be a philosopher and a philosopher could endorse a humanistic approach.

The recent highly perceptive studies of Robert Black, Chris Celenza, Anthony Grafton, Kenneth Gouwens, Jill Kraye, James Hankins, and Ronald

G. Witt have pointed out that a historical period of such complexity as the Renaissance cannot be summed up by means of a simple definition. Of course, a historical period will have its own particular physiognomy, and the attempt to identify that physiognomy must proceed gradually and a definition must be formulated only at the end of the research and not at its outset. But it is even more difficult to determine what Renaissance philosophy was, because the history of philosophy is usually written from the point of view of one particular philosophy, and each point of view generally gives little attention to thinkers or problems which are unrelated.

Recent scholarship has made it very clear that the goal of historians of philosophy should be to write a history of philosophy which entertains everything that has at any one time been considered part of philosophy. The Renaissance was a complex, hybrid phenomenon, with chronologically and geographically diverse and varied roots. The latest research has established that there cannot be a simple approach to this heterogeneous series of historical developments (Black 2005, 99). This is the reason why the ERP is now tackling the question of what an effective methodology for a Renaissance history of philosophy might be, in particular reflecting on the potential for new technology for determining new historical paradigms and categories.

ERP proposes to rethink the Renaissance and its “thought” through a specifically historical and bottom-up approach. This historiographical methodology can be termed “liquid” and therefore characterizes a “liquid Renaissance.” The term is employed in the same way as contemporary historians and sociologists characterize a “liquid democracy” or “liquid society” – that is, when one or more parts of the whole constitute – whether dynamically, voluntarily, or involuntarily – the whole itself, which in a continuous cyclical movement works to redefine each of the parts. The methodological idea of the ERP is that each protagonist or event of a historical period or intellectual movement influences, shapes, and determines not only the historical period itself or the philosophical movement but also the way in which historians conceive of them through specific historiographical categories that – in turn – have impact on the historiographical research as filters that allow for the re-involvement of the same protagonists or events or novel elements. To historians it is evident that it is impossible not to see the past from the point of view of the present, but this needs to be done in the correct way, or else certain aspects of the past may be overlooked or misunderstood. The methodology underpinning the ERC should help provide a better understanding of the past through recapturing its categories as far as that is possible. The Renaissance will thus be carefully historically qualified according to time and place and constantly redefined according to the progress of scholarship, since what the Renaissance was or is shifts in the course of time almost kaleidoscopically.

This is in itself nothing very new: we learn this from hermeneutics. But hermeneutics led to negative results because it is impossible to escape from the hermeneutic circle. A possible solution can be found in applying the second sociological notion advanced recently by Peter Burke in his *Social History of Knowledge* – that is, “reflexivity.” What is reflexivity in the case of the

historiography applied specifically to the new technologies employed for the ERP? A reflexive methodology comprises three stages.

1. Writing entries – that is, case studies – on Renaissance philosophy, where in the first instance for “Renaissance” is understood the period between 1300 and 1650, and for philosophy all that material that is based on ancient or medieval philosophy or that had influenced philosophy.
2. From these case studies, there is created an overall picture of what the Renaissance was, but this is not static; rather it is dynamic. In fact, this picture allows us to reinterpret what has already been written or to speculate about what should be written in the future according to what has been uncovered. This is possible because the medium is not a static printed page on paper but a dynamic online electronic version.
3. From the first very provisional overall sketch of the Renaissance it becomes possible to write progressively more insightful entries, maintaining the record of past entries, showing thus the evolution of the scholarship, and eventually reconfiguring the initial time span (1300–1650), or even the very conception of philosophy itself. Thus it may be possible to get closer to an understanding what the Renaissance is and was, and how the conception of it has changed over time. This is an activity of writing and rewriting history not possible 20 years ago, and which opens up the possibility for historians to be more precise in their process of historical reconstruction.

To take a single example: in writing the entry “Love,” the historian understands that Pietro Bembo contributed to the topic, but Bembo is not included in the ERP because he is usually considered a man of letters and not a philosopher; yet it is possible now to include the entry “Bembo, Pietro” directly in the ERP, reshaping the idea of what philosophy was in the Renaissance. Bembo is just one instance. In writing the entry on “Bembo, Pietro,” who knows what else we may uncover – perhaps we will include authors such as Romolo Amaseo or others. It seems a never-ending story, as every good piece of research is: something very concrete in practice and that continuously mirrors the state-of-the-art of historical research.

There is a Renaissance parallel for this kind of reflexivity, and it is what the Renaissance logicians called *regressus*, where from new knowledge of a particular we arrive at new knowledge of other particulars, through a new general or universal form of reconstruction, never static as a metaphysical entity, but always “liquid.” It’s a post-modern historiographical methodology, based on micro-historical enquiry and on an inductive approach which determines the various historical narratives.

The ERP is based on a bottom-up approach – that is, the project does not presuppose a fixed idea of what philosophy is, and on that basis is it decided which entries to include; rather, the ERP aims to allow the nature of Renaissance philosophy and contemporaneous philosophical problems to emerge from the entries. The goal is ambitious, because nothing is definitive in the adoption of this methodology. However, it is possible to venture some basic

principles and assurances in that the ERP will be published in four different formats: (1) an HTML online dynamic version; (2) an online pdf version; (3) an HTML static version; (4) a paper edition. The ERP has been conceived very particularly for the HTML dynamic version in being designed from the start as a liquid and reflexive entity. The online platform allows entries to be edited and updated whenever the need arises (of course, only where necessary) on a continuous basis into the longer term. Being continuously revised and updated, it will always be at the forefront of thinking, and it will thus remain the key reference for future generations of scholars. Furthermore, with SpringerReference it will be possible to link a word in an entry to an infinite number of other entries present in SpringerReference, on SpringerLink, or on the internet.

With a determined nod to intellectual history and the history of problems, each entry considers the legacy – and departure from – of past philosophical tradition, highlighting the innovations and originality of Renaissance philosophical thought. There will be five different kinds of entry: (1) disciplines; (2) problems and concepts; (3) philosophical, political, social, religious movements; (4) philosophers; (5) context. Most entries will conform to the following format: (1) introduction; (2) connection with, and departure from, tradition; (3) innovation and original aspects; (4) impact and legacy; (5) references to other entries; (6) primary literature; (7) secondary literature. Entries on individual philosophers will include a biographical section. The introduction has been conceived as a sort of summary or abstract accessible to the general reader in philosophy or in the particular field of competence of the entry. The entries are organized in an A–Z format for ease of access. There are a range of word counts offered: two varieties of short entry of 600/700 and 1500–3000 words each; a medium entry of 6000 words; and a fuller survey entry of 10,000 words.

Being conceived as online platform, this printed edition reflects the situation at October 2020 with all its limitations. Many entries are now under revision and production for the online version, lining up to change the image of philosophy in the Renaissance.

About the Editor

Marco Sgarbi Dept. of Philosophy a. Cultural Heritage, Università Ca' Foscari Venezia, Venice, Italy

Marco Sgarbi teaches history of philosophy at the Università Ca' Foscari, Venice. He was the PI of the ERC Starting Grant 2013 on “Aristotle in the Italian Vernacular: Rethinking Renaissance and Early-Modern Intellectual History (c. 1400–c. 1650).” He was Alexander von Humboldt experienced research fellow at the Max-Planck-Institut für Wissenschaftsgeschichte in 2020–2021. He was Jean-François Malle-Harvard I Tatti fellow at Villa I Tatti, the Harvard University Center for Italian Renaissance Studies and Frances A. Yates Short-Term fellow at the Warburg Institute. He is the editor of *Philosophical Readings*, a four-monthly online journal, and of the Bloomsbury Studies in the Aristotelian Tradition. Among his publications are *Francesco Robortello (1516–1567): The Architectural Genius of the Humanities* (London: Routledge, 2019); *Profumo d’immortalità. Controversie sull’anima nella filosofia volgare del Rinascimento* (Rome: Carocci, 2016); *The Italian Mind: Vernacular Logic in Renaissance Italy (1540–1551)* (Leiden: Brill [Medieval and Renaissance Authors and Texts n. 12], 2014); and *The Aristotelian Tradition and the Rise of British Empiricism: Logic and Epistemology in the British Isles (1570–1689)* (Dordrecht: Springer [Studies in History and Philosophy of Science n. 32], 2013).

Associate Editor

Teodoro Katinis Department of Literary Studies, Ghent University, Ghent, Belgium

Teodoro Katinis is Research Professor of Italian Literature in the Department of Literary Studies at Ghent University. Among other positions, in 2015–2016, he was a Marie Skłodowska-Curie fellow at Ca' Foscari University of Venice. Katinis holds a Ph.D. in Italian studies (Johns Hopkins University) and a Ph.D. in philosophy (Università degli Studi Roma Tre). His first monograph on philosophy and medicine in *Marsilio Ficino* (Edizioni di Storia e Letteratura, 2007) collects the first results of his research on the early modern medical literature; while his second monograph (Brill, 2018) investigates the rebirth of the ancient sophistry in Sperone Speroni and the Italian Renaissance. The outcomes of other research subjects, including the Platonism and its enemies in the political literature of the Renaissance, Torquato Tasso's poems and poetics, the early modern theories of rhetoric, the paradoxical dialogue genre, and the debate over neo-Latin and the vernacular, have been published in international journals and volumes. Katinis has supervised several international projects on different subjects in the field of Renaissance studies and has taught courses on Italian literature, history, and philosophy in Italy, the USA, and Belgium.

About the Section Editors

Luca Bianchi Università degli Studi di Milano, Milan, Italy

Luca Bianchi is full Professor of history of medieval philosophy and currently serves as Head of the Department of Philosophy at the University of Milan, Italy. He is a member of the editorial board of several journals, including the *Rivista di Storia della Filosofia*, *Medioevo* and *Vivarium*, and of the advisory board of *Dante Studies*. Since 2013, he is coeditor, with Jacques Verger and Olga Weijers, of the series *Studies on the Faculty of Arts. History and Influence* (Brepols, Turnhout); since 2015, he is coeditor, with Dominique Poirel, of the series *Studia Artistarum* (Brepols, Turnhout). He has published extensively on medieval, Renaissance, and early modern thought. His books include *Il vescovo e i filosofi. La condanna parigina del 1277 e l'evoluzione dell'aristotelismo scolastico* (Bergamo: Lubrina, 1990); *Censure et liberté intellectuelle à l'Université de Paris* (Paris: Les Belles Lettres, 1999); *Studi sull'aristotelismo del Rinascimento* (Padova: Il Poligrafo, 2003); and *Pour une histoire de la "double vérité"* (Paris: Vrin, 2008). He edited *Christian Readings of Aristotle from the Middle Ages to the Renaissance* (Turnhout: Brepols, 2011) and coedited, with Simon Gilson and Jill Kraye, *Vernacular Aristotelianism in Italy from the Fourteenth to the Seventeenth Century* (London: The Warburg Institute, 2016).

Paul Richard Blum Department of Philosophy, Loyola University Maryland, Baltimore, MD, USA

Paul Richard Blum is Professor Emeritus at Loyola University Maryland (Baltimore); before that he was Professor at Pázmány Péter Catholic University in Budapest; he also was Visiting Professor at Palacký University in Olomouc (Czech Republic). He obtained his Ph.D. in Munich and his habilitation in Berlin. He specializes in philosophy of the Renaissance and early modern scholasticism. Recent research concerns the philosophical anthropology of slavery. Among recent publications are *Nicholas of Cusa on Peace, Religion, and Wisdom in Renaissance Context* (Regensburg: Roderer, 2018); *Giordano Bruno Teaches Aristotle* (Nordhausen: Traugott Bautz, 2016) (Italian: *Giordano Bruno lettore di Aristotele* (Lugano: Agorà, 2016); text edition: Gasparo Contarini, *De immortalitate animae – On the Immortality of the Soul* (Nordhausen: Traugott Bautz, 2020). He edited *Philosophers of the Renaissance* (Washington: CUA Press, 2010).

Alejandro Coroleu Faculty of Arts, Department of Catalan Language, Universitat Autònoma de Barcelona, Barcelona, Bellaterra (Cerdanyola), Spain

ICREA-Universitat Autònoma de Barcelona, Barcelona, Spain

Alejandro Coroleu, after studying Classics and Renaissance Studies at the Universitat de Barcelona, undertook postdoctoral research at the Warburg Institute (University of London). He taught and researched at the University of Nottingham between 1995 and 2008. He has also been Visiting Lecturer at the University of Cambridge and at the University of Salzburg. Since 2009 he is a Research Professor at ICREA in the Department of Catalan at the Universitat Autònoma de Barcelona. His research focuses on Neo-Latin and humanism in Renaissance Spain. It also spans Italian Neo-Latin letters and their contact with neighboring cultures. He works on the prominent role played by translation and imitation of Classical authors in fifteenth- and sixteenth-century Iberia. Among his publications are *Latin and Vernacular in Renaissance Iberia, III: Ovid from the Middle Ages to the Baroque*, edited by Barry Taylor and Alejandro Coroleu (London: Splash Editions, 2020); “Marginalia in a Rare Edition of Virgil,” *Translat Library* 1, no. 3 (2019), pp. 1–8; Lluís Cabré, Alejandro Coroleu, Montserrat Ferrer, Albert Lloret, and Josep Pujol, *The Classical Tradition in Medieval Catalan, 1300–1500: Translation, Imitation, and Literacy* (Martlesham: Boydell & Brewer, 2018); *Brief Forms in Medieval and Early Modern Hispanic Literature*, edited by Barry Taylor and Alejandro Coroleu (Newcastle upon Tyne: Cambridge Scholars Publishing, 2017); and *Printing and Reading Italian Latin Humanism in Renaissance Europe (ca. 1480–ca. 1540)* (Newcastle upon Tyne: Cambridge Scholars Publishing, 2014).

Violaine Giacomotto-Charra Université Bordeaux Montaigne, UFR Humanités, Pessac, France

Violaine Giacomotto-Charra is full Professor of Renaissance literature at the Bordeaux Montaigne University and runs the Centre Montaigne. She also teaches history of knowledge. She is a former student of the École Normale Supérieure de Fontenay-St Cloud (1991–1995), obtained an aggregation in letters in 1993 and a doctorate in letters in 2005. She defended her “Habilitation à diriger des recherches” (Professorial thesis) at the École Normale Supérieure of Paris (ENS-PSL) in 2017. Her research interest focuses on the French philosophical poetry and on the writing of the philosophical and medical knowledge in the Renaissance. She published in 2009 a study about the French poet Guillaume Du Bartas (*La Forme des choses. Poésie et savoirs dans La Semaine de Du Bartas*, Presses Universitaires du Midi), and the monograph for her “Habilitation” deals with the history of French Renaissance natural philosophy, and mainly with the philosophical works of Scipion Dupleix: *La Philosophie en langue française à la Renaissance. Des premiers textes à l’œuvre de Scipion Dupleix* (Genève: Droz, 2020).

Hiro Hirai Columbia University, New York, USA

Hiro Hirai, Ph.D. in philosophy and history of science, University of Lille 3 (France), is a research associate at the Center for Science and Society, Columbia University (New York). He has published widely in Renaissance and early modern natural philosophy, medicine, and alchemy, including *Le concept de semence dans les théories de la Renaissance* (Turnhout: Brepols, 2005) and *Medical Humanism and Natural Philosophy* (Leiden: Brill, 2011). He also edited *Jacques Gaffarel Between Magic and Science* (Roma: Fabrizio Serra, 2014) and coedited *The Marginalization of Astrology* (Leiden: Brill, 2017) and *Pseudo-Paracelsus: Forgery and Early Modern Alchemy, Medicine and Natural Philosophy* (Leiden: Brill, 2021). In addition, he acted as a section editor of chemistry and alchemy for Springer's *Encyclopedia of Early Modern Philosophy and the Sciences*. Hiro Hirai is currently preparing his third monograph on Renaissance philosophy, medicine, and magic.

Jill Kraye The Warburg Institute, London, UK

Jill Kraye is Emeritus Professor of Renaissance philosophy at the University of London and an Honorary Fellow of the Warburg Institute. Her publications center on Renaissance humanism and Renaissance philosophy, with a particular focus on the influence of classical thought from the Middle Ages to the early modern era. She is one of the editors of the *Journal of the Warburg and Courtauld Institutes* and of the *International Journal of the Classical Tradition*. She is a section editor (for the fifteenth century) of the Springer *Encyclopedia of Medieval Philosophy: Philosophy Between 500 and 1500* (first edition 2011; second edition, forthcoming) and of the online *Stanford Encyclopedia of Philosophy* (for the Renaissance and sixteenth century) and a member of board of the Oxford Francis Bacon. A Festschrift in her honor, *Et amicorum: Studies in Renaissance Humanism and Philosophy* (Leiden: Brill, 2018), was published in 2018. She held the Lectio Chair at the University of Leuven in 2018; and in 2020, she was awarded the Serena Medal by the British Academy for her contributions to the history of Italian philosophy. Among her publications are *Classical Traditions in Renaissance Philosophy* (Aldershot and Burlington VA: Ashgate, 2002); *Cambridge Companion to Renaissance Humanism* (Cambridge: Cambridge University Press, 1996); *Cambridge Translations of Renaissance Philosophical Texts*, 2 vols. (Cambridge: Cambridge University Press, 1997); joint-editor, with Luca Bianchi and Simon Gilson, *Vernacular Aristotelianism in Italy from the Fourteenth to the Seventeenth Century* (London: Warburg Institute, 2016); and joint-editor, with Gian Mario and Anthony Grafton, *The Marriage of Philology and Scepticism: Uncertainty and Conjecture in Early Modern Thought* (London: Warburg Institute, 2019).

David A. Lines Italian Studies, School of Modern Languages and Cultures, University of Warwick, Coventry, UK

David Lines is Professor of Renaissance Philosophy and Intellectual History at the University of Warwick and directs Warwick's Centre for the Study of the Renaissance. He is general editor for the new book series Warwick Studies in Renaissance Thought and Culture (Brepols). He has published widely on Renaissance thought and its contexts, with particular attention to Italian universities and the Aristotelian tradition, and was PI for a major project (funded by the UK's Arts and Humanities Research Council) on "Vernacular Aristotelianism in Renaissance Italy" as well as a Leverhulme International Network on "Renaissance Conflict and Rivalries." Lately he has also been working on philosophical translation in the Renaissance. His main publications include *Aristotle's "Ethics" in the Italian Renaissance (ca. 1300–1650): The Universities and the Problem of Moral Education* (Leiden: Brill, 2002); *Rethinking Virtue, Reforming Society: New Directions in Renaissance Ethics, c. 1350–1650*, ed. with Sabrina Ebbersmeyer (Turnhout: Brepols, 2013); *"Aristotele fatto volgare". Tradizione aristotelica e cultura volgare nel Rinascimento*, ed. with Eugenio Refini (Pisa: ETS, 2015); and *"In Other Words": Translating Philosophy in the Fifteenth and Sixteenth Centuries*, ed. with Anna Laura Puliafito, special issue of *Rivista di storia della filosofia*, 74.2 (2019), 181–399. Currently, he is completing a monograph on the teaching of arts and medicine at the University of Bologna (c. 1400–1750).

Anna Laura Puliafito University of Basel, Basel, Switzerland

Anna Laura Puliafito is currently Research Honorary Fellow at the University of Warwick. Her research focuses on the relationship between metaphysics, revelation, and science in sixteenth-century Europe, in particular the discussion about perfect rhetoric, poetry, and knowledge, and different forms of intellectual exchange, in particular Italian academical circles. Within her publications there are contributions on Francesco Patrizi da Cherso, Bernardino Telesio, Giordano Bruno, the Accademia Veneziana della Fama, the circulation of hermetic texts, and literary and philosophical aspects of the discussion about the rationality of animals. She is currently involved in the ERC-Project on *Aristotle in the Italian Vernacular: Rethinking Renaissance and Early-Modern Intellectual History, 1400–1650* (in collaboration with the University of Venice), focusing on the Italian translations of Aristotle's *Rhetoric*. She edited Francesco Patrizi da Cherso, *Nova de universis philosophia. Materiali per un'edizione emendata* (Firenze: Olschki 1993); Francesco Patrizi da Cherso, *Della retorica dieci dialoghi. Ristampa anastatica dell'edizione Venezia 1562* (Lecce: Conte, 1994); and Francesco Martelli's Vernacularization of Telesio's *De rerum natura* of 1572 (Roma: Carocci, 2013). She published a monograph on Bruno's *Candelaio* entitled *Comica pazzia. Vicissitudine e destini umani nel Candelaio di G. Bruno* (Firenze: Olschki, 2007). She has taught for many years "Academic Writing" and "Translation" at the University of Basel (Switzerland). She is also working as a translator of critical writings, in particular from German, English, French, and Spanish into Italian.

Matteo Valleriani Max Planck Institute for the History of Science, Berlin, Germany

Matteo Valleriani is research group leader in the Department I at the Max Planck Institute for the History of Science in Berlin, honorary Professor at the Technische Universität of Berlin, and Professor by Special Appointments at the University of Tel Aviv. He investigates the relation between diffusion processes of scientific, practical, and technological knowledge and their economic and political preconditions. His research focuses on the Hellenistic period, the late Middle Ages, and the early modern period. Among his principal research endeavors, he leads the project “The Sphere: Knowledge System Evolution and the Shared Scientific Identity of Europe” (<https://sphaera.mpiwg-berlin.mpg.de>), which investigates the formation and evolution of a shared scientific identity in Europe between the thirteenth and seventeenth centuries. Among his publications, he has authored the book *Galileo Engineer* (Dordrecht: Springer 2010), is editor of *The Structures of Practical Knowledge* (Dordrecht: Springer, 2017), and has published *De sphaera of Johannes de Sacrobosco in the Early Modern Period: The Authors of the Commentaries* (Dordrecht: Springer, 2020).

Vasileios Syros Finnish Center of Political Thought and Conceptual Change, Jyväskylä Yliopisto, Finland

Vasileios Syros teaching and research interests converge at the intersection of the history of Christian, Jewish, and Islamic political thought and comparative political theory. Syros has published *Marsilius of Padua at the Intersection of Ancient and Medieval Cultures and Traditions of Political Thought* (Toronto: University of Toronto Press, 2012); *Die Rezeption der aristotelischen politischen Philosophie bei Marsilius von Padua* (Leiden: Brill, 2007); and *Well Begun Is Only Half Done: Tracing Aristotle's Political Ideas in Medieval Arabic, Syriac, Byzantine, and Jewish Sources* (Tempe: ACMRS, 2011). His work has appeared in a number of international peer-reviewed journals, including *Renaissance Quarterly*, *Viator*, *Journal of Early Modern History*, *Intellectual History Review*, *Medieval Encounters*, *Journal of World History*, *Philosophy East and West*, *History of Political Thought*, and *Revue des Études Juives*. From 2014 to 2018 he directed the research program “Political Power in the Early Modern European and Islamic Worlds” and previously served as Principal Investigator for the project “Giovanni Botero and the Comparative Study of Early Modern Forms of Government” (2012–2017), which have both been funded by the Academy of Finland. He has taught at Stanford University, McGill University, the University of Chicago, and the École Pratique des Hautes Études and served as Royal Netherlands Academy of Arts and Sciences Visiting Professor. Syros has received fellowships from I Tatti – The Harvard University Center for Italian Renaissance Studies, the University of Michigan, Columbia University, the University of Pennsylvania, Princeton University, the Royal Society of Edinburgh, the Waseda Institute for Advanced Study, and the Hebrew University of Jerusalem. He is the editor of the *Edinburgh Studies in Comparative Political Theory and Intellectual History* (Edinburgh University Press) and serves on the editorial boards of various book series and journals, including *Republics of Letters* (Stanford University), *Comparative Political Theory*, *Early Science and Medicine*, and *Global Perspectives on Medieval and Early Modern Historiography*.

Michael Wyatt Florence, Italy

Michael Wyatt is an independent scholar. Having studied philosophy and theology at the Università Gregoriana (Rome), he received his Ph.D. in Italian Studies at Stanford University in 2000. He has taught at Northwestern University, Wesleyan University, the Università degli Studi di Trento, Stanford University – where he also served as the founding Associate Director of the Center for Medieval and Early Modern Studies – and Dartmouth College. Wyatt has been the recipient of fellowships at the Wesleyan University Center for the Humanities, I Tatti – the Harvard University Center for Italian Renaissance Studies, and from the National Endowment for the Humanities. His work is engaged with the premodern cultural and intellectual history of Italy, focused within a European and Mediterranean matrix, and dealing particularly with issues related to translation as both textual and sociopolitical practice. Wyatt has lectured extensively in the United States, Italy, England, France, Spain, and Australasia. He is currently working on two projects: *John Florio and the Circulation of “Stranger” Cultures in Stuart Britain* and *Dido’s Legacy: Oblivion and Promise in Italy’s Past Present*. Among his publications are *Ariosto and the Arabs: Contexts of the Orlando Furioso* (ed., with Mario Casari and Monica Preti), Officina Libraria and I Tatti – The Harvard University Center for Italian Renaissance Studies, forthcoming 2021; *The Cambridge Companion to the Italian Renaissance* (Cambridge: Cambridge University Press, 2014); “Translating for Queen Anne: John Florio’s *Decameron*”, in *The Forms of Renaissance Thought, New Essays in Literature and Culture*, pp. 75–85 (eds. Leonard Barkan, Bradin Cormack, and Sean Keilen) (London: Palgrave Macmillan, 2009); *Writing Relations, American Scholars in Italian Archives: Essays for Franca Nardelli Petrucci and Armando Petrucci* (ed., with Deanna Shemek) (Firenze: Leo S. Olschki, 2008); and *The Italian Encounter with Tudor England: A Cultural Politics of Translation* (Cambridge: Cambridge University Press, 2005).

Abbacus School

Jens Høyrup
Section for Philosophy and Science Studies,
Roskilde University, Roskilde, Denmark

Abstract

The abbacus school was a school for artisans' and merchants' sons, functioning in northern Italy (thirteenth to sixteenth century). It taught the use of Hindu-Arabic numerals and fundamental commercial arithmetic: the rule of three, monetary and metrological conversions, simple and composite interest, partnership, simple and composite discounting, alloying,

the technique of a "single false position," and, finally, simple area calculation. Topics like the double false position were not part of the curriculum, but they are often dealt with in the abbacus treatises; they probably served to show virtuosity in the competition for employment and pupils.

The manuscripts connected to the abbacus school tradition are of very different character. Some are messy problem collections, some orderly presentations, and a few genuine encyclopaediae. Some are produced by mathematically incompetent compilers and some by the best European mathematicians of the age.

Traditionally but mistakenly, the abbacus books are to be derived from Leonardo Fibonacci's *Liber Abbaci* and *Practica Geometriae*. As shown by closer inspection of the texts, they derive from direct inspiration from a broader Mediterranean environment, which had also inspired Fibonacci around 1200. After c. 1330, however, the abbacus tradition had become an autonomous current, no more significantly influenced by the Arabic or Ibero-Provençal world. Influences from Boethian and Euclidean arithmetic, though existing, remained peripheral.

Printing allowed the preparation and spread of the great works of Luca Pacioli, Girolamo Cardano, and Niccolò Tartaglia, as well as more modest books corresponding to the school curriculum. The former group,

Translations into English are due to the present author.

integrated with the theory of irrationals of *Elements* X, provided the basis for the renovation of algebra brought about by Viète and Descartes; the latter made possible the spread of abacus-type teaching of basic applied arithmetic to the whole of Western Europe, where it stayed alive until c. 1960.

Character and Beginnings

The abacus school was a school type existing in the region between Genova, Milan, and Venice to the north and Umbria to the south from the mid-thirteenth to the sixteenth century. It was mainly frequented by merchant and artisan youth for 2 years or less around the age of 12–14 (a few younger or older), who here learned basic arithmetic, having already learned reading and writing and before starting apprenticeship.

Etymologically, *abbaco* obviously comes from Latin *abbacus* (< Greek $\alpha\beta\alpha\chi$), a reckoning board. However, *abbaco* (which we may distinguish by using the most common spelling of the time) has nothing to do with reckoning boards of any kind. The first known occurrences of the word are in Leonardo Fibonacci's *Liber Abbaci* (1857) and *Practica Geometriae* (1862) and in a few references in the latter to the former as his *Liber Abbaci*. Most of these references are compatible with a generic understanding as “practical computation,” but a few give more restrictive information: the *Liber abbaci* (p. 5) as well as the *Practica* (p. 8) specify that *abbacus* encompasses finger reckoning, while the *Liber abbaci* (p. 353) ascribes to the abacus a particular way to extract the square root of a non-square, multi-digit number. It seems that Fibonacci refers to a particular teaching tradition, which could be represented by the school (or whatever it was) where his father let him pursue “the study of the abacus” in Bejaïa for some time during his boyhood (Fibonacci 1857, 1); but it may just as well correspond to a more widely disseminated Mediterranean type (the Italian area can probably be disregarded).

Whatever Fibonacci meant precisely by the word (if it was really his) may have been as obscure to his contemporaries as to us, but it caught on, first probably meaning “practical” or “commercial computation” and then soon

referring to the new Italian school tradition that came to teach that topic. In 1241, Fibonacci received a yearly pension from the Commune of Pisa represented by its officials in *abbacatione* for his consulting services in *abbacandi* estimations (Bonaini 1857, 241) – thus probably not for teaching; but in 1265 a document refers to a master teaching the abacus in Bologna. In the 1280s sources start talking about abacus teachers paid by the city communes; in the longer run, only smaller cities would need to do that; Florence and Venice seem to have relied on privately run schools. Such schools remained in existence at least until the late sixteenth century – Ulivi (2002) offers a convenient survey.

Students and Teaching

The students, as mentioned, were mostly sons of artisans and merchants – including those belonging to the highest mercantile patriciate. But also Machiavelli, a lawyer's son, was sent to the abacus school of Pier Maria Calandri (Black 2007, 379). In the city of Florence, in much of the period, between one fourth and one half of all children learned to read and write, and perhaps 10% of boys frequented the abacus school (Høyrup 2007, 27). In other towns the percentage may have been considerably lower – not to speak of the countryside, the abacus school was urban.

What did these boys learn? *Not* accounting – that was learned on-the-job by bank and merchant house apprentices. We happen to know two documents that outline a curriculum; one, from the earlier fifteenth century, is said to correspond to “the Pisa way” (Arrighi 1967); the other tells what was done in a Florentine school in 1519 (Goldthwaite 1972). The differences are modest and mainly concern the order in which things were taught; scattered remarks in the writings of various abacus masters support the assumption that the two documents taken together are representative.

The initial part of the course taught operations with pure numbers. First came the writing of Hindu-Arabic numerals and, next, the multiplication tables and their application. Neither source mentions addition and subtraction – these techniques may have been implicit in the learning of

the number system. Division followed, beginning with divisors known from the multiplication tables and going on with multi-digit divisors. Calculation with fractions ended the first part.

The second part of the course trained commercial mathematics (in different order in the two curricula): the rule of three, monetary and metrological conversions, simple and composite interest and reduction to interest per day, partnership, simple and composite discounting, alloying, the technique of a “single false position,” and, finally, area measurement.

From the multiplication tables onward, everything was accompanied by problems to be solved as homework. More complex matters, like the use of a double false position and algebra, are amply treated in many “abbacus manuscripts” (a notion to be dealt with imminently), but they appear not to have been part of the curriculum.

The “Abbacus Books”

Though published almost four decades ago, (Van Egmond 1980) it remains an almost complete catalogue of known “abbacus manuscripts.” These have in common to have been produced by writers who appear to have been connected – as former students or as teachers – to the abbacus school environment and to deal with mathematics. Some are messy collections of problems (*zibaldoni*), while some could look like “teacher’s books” (the students themselves did not have books), presenting a sequence of topics in an orderly way (but they may also be written for patrons or friends, some indeed claim to be adequate for self-study); three are genuine mathematical encyclopediae – Benedetto da Firenze’s *Pratica d’arismetricha* from 1363 was copied often, while Ottobon. lat. 3307 from c. 1365, and the slightly earlier Florence, Bibl. Naz. Centr. Palat. 573 are known only from their compilers’ autographs (Høyrup 2010, 32, 39). Some of the manuscripts are author’s autographs (but they may still draw heavily on earlier texts, as most mathematics textbook still do today), some are booksellers’ or similar copies, some are anonymous, some carry the name of the author, and some borrow the name of a famous author but

alter or maltreat his text in one or the other way. Some authors have a deep understanding of the mathematics they present even when it is advanced, others make blunders as soon as the inverse rule of three or volumes are involved, and some cheat, either knowingly or naively plagiarizing the fraud of predecessors – the abbacus manuscript of Piero della Francesca famously falls in the latter category (Giusti 1991, 64). This mainly regards the presentation of glaringly false rules for the solution of irreducible algebraic problems of the third or fourth degree, probably used to impress mathematically incompetent municipal authorities and to dumbfound rivals in competitions for employment (Høyrup 2009).

Fibonacci Versus General Mediterranean Background

It is a recurrent claim that the abbacus books are derived from and represent reduced versions of Fibonacci’s *Liber Abbaci* and *Practica Geometriae* – representative quotations in (Høyrup 2005, 24–25). This is an almost complete mistake. The term *abbaco*, it is true, is likely to be inspired by Fibonacci, and one of the earliest known abbacus treatises also cites and draws on the *Liber abbaci*.

This treatise (Florence, Riccardiana 2404, ed. Arrighi 1989) presents itself as *Livro de l’abbecho secondo la oppenione de maestro Leonardo de la chasa degli figluogle Bonaçie da Pisa*, “Abbacus book according to the opinion of master Leonardo Fibonacci.” It is a beautiful *de luxe* vellum copy of an original which because of misinterpreted internal evidence (copied older loan documents) has been dated to 1288–1290. It must be slightly to somewhat later but hardly later than the first decade of the fourteenth century (the author does not recognize the most basic algebraic terminology). As closer analysis reveals, the text moves on two levels, clearly distinguishable in their number terminology (Høyrup 2005). On one level we find material adapted to the curriculum of the abbacus school. This level has absolutely nothing to do with the *Liber abbaci*. The other level is constituted by sophisticated problems outside the domain

considered in the abbacus school. Here, almost everything is translated from the *Liber abbaci* – unfortunately, as it turns out, often without understanding. It seems that Fibonacci had already become a mythical culture hero for abbacus mathematics around 1300 – but with little real impact.

Characteristic is the way the essential rule of three is dealt with. Fibonacci does not really present a rule; he seems to describe (in terms taken from Euclidean theory) what he has observed to be done on an Arabic dust or clayboard (Arabic since inscription starts from the right, and the left is “behind”) (Fibonacci 1857, 83f):

In all commercial exchanges [*negotiationes*], four proportional numbers are always found, of which three are known, but the remaining unknown. The first of these three known numbers is the number of sale of any merchandise, be it number, or weight, or measure [explanatory examples]. The second, however, is the price of this sale [...]. The third, then, will be the sale of some quantity of this merchandise, whose price, namely the fourth, unknown number, will not be known. Therefore, in order to find the unknown number from those that are known, we give a universal rule for all cases, namely, in the top of a board write the first number to the right, namely the merchandise. Behind in the same line you posit the price of the same merchandise, namely the second number. The third too, if it is the merchandise, write it under the merchandise, that is, under the first, and if it is the price, write it under the price, that is, under the second. In this way, as it is of the kind of that under which it is written, thus it will also be of the quality or the quantity, whether in number, in weight or in measure. [...]. When they are described thus, it will be obvious that two of those that are posited will always be contrary [*ex adverso*], which have to be multiplied together, and that if the outcome of their multiplication is divided by the third number, the fourth, unknown, will doubtlessly be found.

Riccardiana 2404 (Arrighi 1989, 9) gives the rule like this:

If some computation was said to us in which three things are proposed, then we shall multiply the thing that we want to know with the one which is not of the same [kind], and divide in the other.

If one misreads Fibonacci’s *ex adverso* as referring to difference in kind and not to the location in the rectangular frame which he has just described, the Riccardiana formulation may seem to abbreviate the last lines from the *Liber abbaci*. This overlooks,

however, that the Riccardiana formulation had been standard in Indian and Arabic vernacular mathematics for almost a millennium (Høyrup 2012).

Another (now mutilated) early abbacus text, Siena, L. VI. 47₂, was apparently written in Pisa around 1300s; (Franci 2015) suggests a late thirteenth-century date, (Ulivi 2011), better argued, the early fourteenth century. The author might be a certain Bindo Nocchi de Ambaco, but only chronological overlap supports that assumption. A collection of numerical tables in the beginning might seem to be derived from the *Liber abbaci*. However, Fibonacci borrows a Maghreb term for prime numbers (*ašamm*) as *hasam* and *asam*, while the Siena text uses *la salma*, clearly derived (with misunderstanding) from something like *al-ašammā*⁵, with the article, double consonant, and a feminine ending which Fibonacci does not indicate and which must come directly from spoken Arabic. Moreover, even though the initial introduction of the rule of three has been lost (if it was ever present), it is clear from the way its use in problems is stated that it coincided with the vernacular form found in the Riccardiana manuscript.

A third early text is the “Columbia algorism” (Vogel 1977), probably the earliest of all, from 1285 to 1290 (Travaini 2003); it has been misdated to the mid-fourteenth century because a coin list was misinterpreted. It contains an explicit introduction of the rule of three – a characteristic twisted version of the vernacular rule which only turns up again in the late fifteenth century but may have survived outside the core abbacus area; however, problems calling for the use of three are mostly reduced to a counterfactual model, of the type “if 3 were 5, what would 7 be?”. This was the standard in all Ibero-Provençal abbacus-type treatises until the end of the fifteenth century and was also known to Fibonacci, who speaks of it (1857, 170) as the vernacular way – in agreement with Fibonacci’s reference in one early manuscript (Vatican, Palat. lat. 1343, fol. 47^r col. II) to reliance on a Castilian source. There are further Iberian affinities in the Columbia algorism, so all in all it turns out that Fibonacci as well as the budding abbacus culture drew independently on both Arabic (Maghreb or al-Andalus) and Christian Ibero-Provençal sources.

This is even more clear if we look at *algebra* – a topic that did not belong to the abbas school curriculum but which is dealt with in many abbas manuscripts. As other advanced topics (in particular the double false position), it may have served in the training of assistant-apprentices – but this is a hypothesis with no support in the sources. What we do know is that proficiency in such difficult matters played a role in the competition for employment or for pupils. Algebra is dealt with in Chapter 15, Section 3 in the *Liber abaci* – but from the very beginning, abbas algebra is in a wholly different style, probably at first borrowed from the Ibero-Provençal area (Høyrup 2007, 147–169). One school tradition in Florence honored Fibonacci and copied a translation of his algebra, but its truly outstanding members (among whom Antonio de’ Mazzinghi in the later fourteenth century and Benedetto da Firenze around 1460) made their own algebraic work in continuation of the abbas tradition.

Autonomization

After the earlier fourteenth century, we find very few plausible instances of recent Arabic or Iberian influence; by then, the abbas tradition had established itself as an autonomous current.

Beginning in the later fourteenth century, on the other hand, some ideas and concepts are adopted from Euclidean and Boethian mathematics into the non-curricular higher level. Antonio de Mazzinghi may have been the first to speak of the sequence of algebraic powers as a continued proportion; Benedetto da Firenze includes a chapter on the Boethian names for ratios in his encyclopedic *Pratica d’arismetricha*, while another chapter draws on Euclid and Campanus in a presentation of the composition of ratios. However, as the roughly contemporary anonymous abbas encyclopedia Florence, Palat. 573 (fol. 17^v) observes concerning the Boethian names, “we in the schools do not use such terms but say instead [...] that 8 is $\frac{2}{3}$ of 12 and 12 is $\frac{3}{2}$ of 8.” The external influence thus remained external and peripheral. This may astonish, given that several abbas masters also taught at universities – but what they taught there

was astronomy and astrology, subordinate to medicine, not mathematical theory.

Impact and Legacy

Only Luca Pacioli, Niccolò Tartaglia, and Girolamo Cardano were to achieve some measure of integration between abbas and theoretical mathematics from the outgoing fifteenth century onward – the former two products of the abbas environment but determined to enter the world of university learning, the latter a university scholar looking at abbas mathematics “from a higher vantage point” (as once Fibonacci). It is no accident that all three had their works printed, but also genuine abbas books appeared in print – first the anonymous *Larte de labbacho*, printed in Treviso (1478), and Pietro Borghi’s *Opera de arithmetica* (1484); Francesco Feliciano da Lazesio’s *Libro de Abbacho novamente composto* (1526) was reprinted as late as 1692.

The latter reprint is symptomatic of one of the repercussions of the abbas tradition in later centuries. Until the new math reforms of the 1960s, the teaching of practical arithmetic in European schools (and such schools of the colonial world where European teaching was imported) remained close to the pattern established by the abbas school. The most direct heirs were the German *Lese- und Rechenschulen*, which however also had to teach reading and writing. The spelling *Coss* of its translation of the algebraic *cosa* shows this German tradition to be derived from northern Italy (Milan etc.), which would write *cossa* – not from Tuscany or Umbria.

At the mathematically higher level, the indubitably most important legacy was *algebra* (Stedall 2010). In part mediated by Michael Stifel’s *Arithmetica integra* (1544) and Simon Stevin’s *L’arithmetique* (1585), the most influential works behind the renovated algebra created by Viète and Descartes were Pacioli’s *Summa de arithmetica* (1494), Cardano’s *Ars magna* (1545), and Rafael Bombelli’s *L’algebra* (1572) – and these, on their part, owe most of their inspiration to the supra-curricular work of abbas writers, complemented by the theory of irrationals of *Elements X*.

Abstract

Leon Abravanel, born Judah Abravanel and known as Leone Ebreo, was a Renaissance Jewish philosopher, author of the *Dialoghi d'amore*. Many aspects of Judah's life and the publication of the *Dialoghi* remain to this day obscure. Composed of philosophical allegories and metaphors, on one side, and mythological and hermetic images, on the other, the *Dialoghi* is a dialogue on love between two characters, a man and a woman, Filone and Sofia, which deals with the concepts of love and desire, the idea of a love circle, and the issue of the soul's

return to God. Leone's *Dialoghi* can be considered as the product of the mosaic-like cultural milieu of fifteenth- and sixteenth-century Italy, an original philosophical discussion on love, in which Neoplatonic elements join with Aristotelian and Jewish features.

Biography and Works

Author of the *Dialoghi d'amore* (Leone Ebreo 2008, 2009), the Renaissance philosopher and physician Leon Abravanel, born Judah Abravanel, best known as Leone Ebreo, the eldest son of Isaac Abravanel, was born between 1458 and 1470 in Lisbon, Portugal, where the Abravanel dwelled, in all probability, since the beginning of the fifteenth century. A date, which can better help us establish Judah's birth year, is the year 1483 when the Abravanel were forced to leave Portugal. Indeed, Isaac Abravanel, together with the influential Duke of Bragança, was charged with conspiracy against King John II. Most scholars have suggested that Judah was a recognized physician in the last quarter of the fifteenth century in Lisbon and that, consequently, he should have been, by then, almost in his early 20s, if not in his mid-20s. This would speak in favor of a birth year before 1465. In support of this hypothesis, relevant are some verses of an elegy, *Telunah 'al ha-zeman* (*Complaint upon the Time*), written in Hebrew by Judah himself at the beginning of the sixteenth century, in particular, the passage from verse 29 to verse 35 (Rodrigues 1981, 560, vv. 29–35). Recounting his exile from Portugal, Judah remembers how, in those days, the Portuguese king pillaged his house, stripping him of all his belongings. From these lines, Judah seems to refer to King Manuel I concerning the persecution against him and his

father Isaac on the score of the aristocrat plot. Actually, the king who accused Judah's father of high treason in 1483 was John II. However, what matters in this context is that, according to Judah's words, he would have acquired, already in the 1480s, assets in silver and gold, evidence of his maturity. Sonne (1934) suggests a different interpretation of these lines, highlighting that the Hebrew personal suffix "my" to the words "silver" and "gold" complies only with the rhyming scheme of the elegy, like in other verses of the poem. Hence, those possessions would be of his family rather than strictly personal. Sonne (1934) also argues that the sources which would attest to Judah's medical practice in Lisbon are unreliable and secondary. Therefore, he estimates Judah's birth around 1470.

From Judah's *Complaint*, an invaluable source for reconstructing his life, we also know that Judah openly looked at his father Isaac as his mentor, admitting to owing him a part of his wisdom (Rodrigues 1981, 562, v. 107). The strong influence played by Isaac on Judah is undeniable, just as it is evident from how Judah commends the father in the prefaces he composed for the publication, in 1505, of three works written by Isaac (*Rosh 'amanah*, *Nahalat 'avot*, and *Zevah Pesah*). The short poem Judah composed for his father's *Commentary on the Latter Prophets*, which appeared on the literary scene in 1520, around 12 years after Isaac's death, is not less appreciatory. Judah Abravanel's *Lament for his Father*, a eulogy presumably written for the funerals of Isaac between Venice and Padua, also reveals the role of Isaac in Judah's life. Indeed, comparing the beloved father, the image of wisdom, to the light of day, Judah regards him not only as his teacher but also as the father and the leader of every Jew (Rodrigues 1981, 571, vv. 8–9).

A de facto influential financial man and a sharp statesman from Portugal to Spain to Italy, Isaac was a recognized leader of the Iberian Jewry, a biblical exegete and a religious thinker, a fifteenth-century man of learning. Although he warns against the limits of philosophy in several of his religious and exegetical works, he was well acquainted with the Greek and Arabic philosophical cultures and was master of the Latin

exegetical and theological tradition, from Augustine to Thomas Aquinas. A kind of humanistic climate could have been the cultural milieu that surrounded the young Judah Abravanel much before his arrival in Italy and the drawing up of his masterpiece, the *Dialoghi d'amore*. Indeed, already Isaac's works show the evident assimilation not only of non-Jewish philosophies but also of humanistic patterns from Latin authors, such as Cicero, Seneca, and Virgil, and the Italian poet Petrarch.

Expelled from Portugal, exiled in Castile, it is quite sure that Judah got married and had his first son, named after his father, around 1490–1491 (Rodrigues 1981, 559–560, vv. 18–23). Meanwhile, Isaac was in the service of the cardinal Pedro González de Mendoza, *el tercer rey de España*, of his nephew, and, presumptively, of the *Reyes Católicos*, Ferdinand II of Aragon and Isabel I of Castile. The Abravanel family lived in Spain until 1492, when the Spanish monarchs, incited by the Spanish Inquisition and its prominent leader Tomás de Torquemada, proclaimed the decree of expulsion of the Jews from the Spanish realm and its dominions at the end of March. According to the *Complaint upon the Time* (Rodrigues 1981, 560, vv. 24–29), the Spanish sovereigns attempted to persuade the Abravanel family and, in particular, Isaac to be baptized kidnapping Judah's first-born son. However, the Abravanel family were able to abort the attempt and save the young child, hiding him in Portugal.

Compelled to leave Castile, Jews could take refuge in Portugal, Navarre, Italy, or Ottoman lands. Because of the sentence of death against Judah's father still in force in Portugal, the Abravanel family headed toward Italy. Guidi (2011) proposes a possible reason for Abravanel's preference for Italy: the friendly relationship between Isaac Abravanel and Yehiel da Pisa, who lived in Florence. Indeed, an epistolary exchange, which certainly testifies to an intellectual network, the dispatch of manuscripts, as far afield as a real fondness between them, can be attested from 1472. The Abravanel family went ashore in Naples, where the sovereign was Ferrante I, born in Valencia and brought up under Spanish and humanistic mores. Ferrante was the natural son of Alfonso

V of Aragon and, for this reason, cousin of the king of Spain, Ferdinand II of Aragon. Despite the blood relation, the king of Naples had, for political and economic reasons, a benevolent and tolerant attitude toward Jews.

According to the biography of Isaac Abravanel written by Baruch Uzziel Forti, in the foreword of Isaac's *Ma'ayanei ha-Yeshu'ah*, a commentary on the *Book of Daniel*, published in Ferrara in 1551 (Ebreo 1929a, *Regesten*, V, Nr. 11), and considering the Edict of Expulsion, the Abravanel should have arrived in Naples around the end of 1492. Judah's father seems to have quickly become one of the most distinguished members of the court of Ferrante I and, soon thereafter, councilor of Ferrante's son, Alfonso II, during the burdensome years of his brief reign. On the 24 July 1494, Judah himself, together with his wife and all his family, was, for all practical purposes, legally like a Neapolitan citizen (*ut cives*), a special concession to Jews (Ebreo 1929a, *Regesten*, VII, Nr. 15).

Naples was renowned for the Academy of Giovanni Pontano, leading figure at the Aragonese court and poet, the perfect portrait of a humanist, deeply interested in astrology. This is the central theme in his work *Urania*, a text that could have influenced, according to Vila-Chã (2006), the astrological conception developed in the *Dialoghi d'amore* by Judah. Naples was also the hearth of an active Jewish community, where Yehudah ben Yehiel Messer Leon's *yeshivah* and the Soncinos' typography were active in those years, increased by the new arrivals in 1492, such as the grammarian and poet Moses ibn Habib, the kabbalist Isaac Mar Hayyim, and the Portuguese scholars Abraham ben Nissim Hayyun and David ben Solomon ibn Yahya. Moreover, in Italy and, in particular, in the Florentine area, in the fifteenth century, the rediscovery of Plato and Neoplatonism sealed a new era in the Renaissance philosophy, enhancing the Aristotelian perspective. Indeed, the structure of the *Dialoghi* is the result of the Italian philosophical and religious syncretism, the mirror image of the humanistic and hermetic sixteenth-century culture in which Platonic elements merge with Aristotelian philosophical features within a

renovated religious framework. The very same Isaac composed the better part of his writings in Italy, when, at the beginning of the sixteenth century, he withdrew to Puglia, between Monopoli and Barletta. Even if the architecture of Isaac's works and his interests are quite different from those of Judah, the closeness and the intimate philosophical interconnection between them did not diminish, fostered by the Italian humanism.

Until 1495, Judah's life appears, as we can deduce, closely linked to his father's career and experience. It is noteworthy how not only the father's life gives us a guideline to get a portrait of Judah's first years of life or youth but also how, after they parted ways, Judah's adulthood becomes challenging to reconstruct. Indeed, at the beginning of 1495, during and because of the French invasion of Italy and the conquest of Naples by Charles VIII, Isaac Abravanel followed his king, Alfonso II, to Sicily, while Judah seems to leave for Genoa, where he presumptively worked as a physician (Leone Ebreo 1929a, *Regesten*, VIII, Nr. 17). Aside from conjectures, it is not possible to determine precisely whether or how long Judah remains in Genoa and if he had established any relationship with the Genoese *literati*.

Most scholars traditionally suppose that Judah has undertaken his philosophical project, the *Dialoghi d'amore*, composed of three dialogues, during this period, at the beginning of the sixteenth century. One of the main elements to support this theory is the year occurring in the third dialogue of the *Dialoghi d'amore*: AM 5262, according to the Hebrew calendar. This year corresponds to the years 1501–1502 in the Gregorian calendar. However, we find this date only in the *editio princeps* of the *Dialoghi*, i.e., the edition published in 1535 by the printer Antonio Blado d'Asola in Rome, and in a manuscript of the third dialogue, MS Barberiniano Latino 3743 (Nelson Novoa 2009). The other four preserved (and known) manuscripts of the third dialogue present instead a variant reading: AM 5272, i.e., 1511–1512. In one of the manuscripts, MS Harley 5423 (Dionisotti 1959), probably copied by the amanuensis Ludovico degli Arrighi in Rome in the 1520s, the year 5272 is the result of a

correction (Nelson Novoa 2009). In this context, we should highlight that the manuscript tradition concerning the *Dialoghi* regards only the third dialogue. Furthermore, we do not have any autographed copy by Judah nor of any other evidence within the text, which can help us clarify the date of composition or give us information about the place and the situation in which Judah wrote his work.

In May 1501, Judah was in Barletta, a city in Puglia near Monopoli, where his father Isaac lived after his sojourns in Sicily and Corfu. Confirming Judah's presence in Puglia, on 10 May 1501, King Federico I of Naples requested support and assistance for Isaac's and Judah's relocation from Barletta to Naples (Leone Ebreo 1929a, *Regesten*, X, Nr. 19). Nevertheless, a letter, dated the last day of February of 1500 of the Venetian calendar, i.e., 1501, written by the ambassador Giovanni Badoer to the Council of Ten, would indicate that at the beginning of 1501, Judah resided in Naples, where he presumably gave public lectures (Nicolini 1930). However, Badoer's letter and the official attestation of Judah in Barletta are not necessarily incompatible. It is possible that Judah moved from Genoa to Naples at the end of 1500 and only in the spring of 1501 to Puglia, maybe to visit his father, as it also seems in Judah's prospective plan in Badoer's epistle. It is also possible that Judah left Naples due to a new forthcoming French threat, catching up with his father in Barletta, very near to Monopoli, which was at the time a Venetian dominion.

After spring 1501, we do not have any specific information about Judah's life until 1507, when he joined his father in Venice. The epistolary exchange between Saul ha-Cohen Ashkenazi and Isaac in 1507 (Leone Ebreo 1929a, *Regesten*, XII, Nr. 28) testifies to Judah's whereabouts in Venice. Moreover, these letters are particularly noteworthy because they highlight not only how much Isaac was proud of his son Judah for his philosophical achievements but also, presumptively, that Judah was writing his *Dialoghi d'amore*. Between 1502 and 1504, Judah also composed the elegy for his lost son, *Telunah 'al ha-zeman*, the introductory poems for his father's books, *Rosh 'amanah*, *Naḥalat 'avot*, and *Zevah*

Pesah, printed in Constantinople in 1505, and later the funeral lament for his father in 1508–1509.

After Venice and Isaac's death, Judah's life falls into obscurity. Two records allow us to know where Judah was in 1520: the first is an elegy, for his father's *Commentary on the Later Prophets*, printed in Pesaro with the cooperation of the very same Judah; the second is an official document, issued by the Viceroy Ramòn de Cardona, as proxy for Emperor Charles V, in which "maestre leon abravanel medico" together with his household was dispensed from the payment of a specific tax (Leone Ebreo 1929a, *Regesten*, XIII, Nr. 33). A private diary written by the Venetian chronicler Marino Sanuto reports the presence of a certain "maestro Lion Hebreo medico" in Naples in 1521, attesting to his medical activity at the Viceroy de Cardona's disposal, his competent efforts to heal Cardinal Raffaele Riario de San Giorgio during the prelate's sojourn in Naples, and his appeal to the viceroy to defend the Neapolitan Jewry's rights (Leone Ebreo 1929a, *Regesten*, XIII, Nr. 34). It is highly presumable that this Leone Ebreo is our Judah, the author of the *Dialoghi d'amore*. Moreover, on 15 May of 1521, an executive order repeats the tax exemption for "leon abravanel" (Leone Ebreo 1929a, *Anmerkungen*, Zu Nr. 33).

Much more uncertain is the information of the prologue to the 1584 Spanish translation of the *Dialoghi*, in which the Spanish translator, Carlos Montesa, provides us with two details: the first about the original language of the *Dialoghi*, which is still today a matter of contention, and the second concerning Judah's acquaintance with the papal court (Leone Ebreo 1929a, *Regesten*, XII, Nr. 31). Not all scholars have rejected the idea of a Roman period in Judah's life and a familiarity with the highest ranks of the Roman ecclesiastical office, basing this theory on the publication in Rome of the *Dialoghi*.

Finally, the words written in the preface by the editor of the *editio princeps*, the integral publication of the *Dialoghi*, Mariano Lenzi, allow us to infer that Judah was already dead in 1535. In the end, considering the ambiguous information on Judah's last years, we should generally assume

that the author of the *Dialoghi* died between 1521 and 1535.

The *Dialoghi d'amore*: The Publication and the Language

The integral edition – if we exclude the controversial theory of a fourth dialogue (Vila-Chã 2006; Guidi 2011) – of the *Dialoghi d'amore*, composed of three dialogues, was printed in Rome by Antonio Blado d'Asola. The editor of the *editio princeps* of the *Dialoghi* was Mariano Lenzi. Manuppella (Hebreu 1983) has shown a relationship between Lenzi and the well-known Claudio Tolomei, a Sienese exile in Rome, poet, and philologist, interested in the development of Tuscan vernacular. Thanks to the letter addressed by Tolomei to Pope Paul III's secretary, Blosio Palladio, Nelson Novoa (2007, 2008) has revealed that Lenzi was Tolomei's nephew. In some way, Claudio Tolomei seems connected to the publication of the *Dialoghi*. The publication of the *Dialoghi* by Tolomei's nephew could be presumptively considered as part of the active debate about the Italian vernacular. Indeed, it is not accidental that a syncretistic dialogue, like that of Leone Ebreo, appeared on the editorial scene when the Italian vernacular was a hotly discussed subject among circles of literati. The question of language was paramount, and literary and philosophical works on love, albeit with differences both in the spirit and in the approach to the love question, shared the Italian vernacular as a communication medium, becoming, in some cases, expressions of different and contrasting Italian vernacular theories. In 1525 Mario Equicola's *Libro de la natura de amore* was published, followed later by Baldassarre Castiglione's *Libro del Cortegiano* (1528), by the 1530 revised version of Pietro Bembo's *Asolani*, and by the publication of Francesco Cattani da Diacceto's *I tre libri d'amore* in 1561. Furthermore, Neri Dortelata finally printed Ficino's vernacular translation of *Commentarium in Convivium Platonis de amore* in 1544, although Ficino had already composed the original Latin text and its vernacular

translation after the second half of the fifteenth century. Noteworthy, in this context and for the connection between the love issue and the vernacular question is Castiglione's interest for Leone's *Dialoghi*, as attested by three letters written in 1525: Castiglione asked for "Leone's books" together with Gian Giorgio Trissino's *Castellano* and Pietro Bembo's *Prose della volgar lingua*, showing that the *Dialoghi* was already known 10 years before their publication.

If doubts on the publication of the *Dialoghi* remain, also the question on the original language of the *Dialoghi* is still open since there is not an autograph of the *Dialoghi*. If we consider the manuscript tradition concerning the third dialogue, we find that MS Patetta 373, the most ancient manuscript (1511–1513), according to Garvin (2001), for example, presents Latinisms, archaisms, and Spanishisms. Consequently, observing where Judah lived, it is possible that the first draft of the *Dialoghi* had been written in Italian vernacular, influenced by Spanish and Latin. Moreover, within the text, Judah often explains Hebrew words and how we should rightly translate them in Italian vernacular. These clarifications seem essential parts of his reasoning as if Judah had written his *Dialoghi* in a different language from Hebrew, addressing them to non-Jewish readers.

Heritage and Rupture with Tradition

The *Dialoghi d'amore* is a philosophical work in a dialogical form, organized in three dialogues, which diverge for subject and length. The first one defines the concepts of love and desire, while the second illustrates a cosmology of love. They both anticipate the principal notions of the third dialogue: the love circle and the soul's return to God. Differences notwithstanding, the three dialogues share a common framework: the courtship of the male character, Filone, toward the female one, Sofia. However, Filone is also the master of love, while Sofia is the disciple. Nevertheless, Judah overturns the roles again in the couple. Indeed, Sofia seems to lead their romantic liaison philosophically. She introduces Filone, as

the real disciple of love, to *Sophia* (wisdom) of a superior and noble love, which heads toward a *fruizione unitiva* with God, away from the physical satisfaction, in which Filone appears yet too interested. Angela Guidi (2011) has suggested an interesting and different interpretation of their intellectual relation, arguing that Leone uses for the dialogic scheme between Filone and Sofia a biblical model, that of the conversation between King Solomon and the Queen of Sheba. Therefore, according to Guidi (2011), Filone, who embodies the Solomonic Jewish divine wisdom, maintains his primary and superior role, trying to lead on a path of “Judaization” Sofia, the foreign woman, the personification of the pagan Greek philosophy.

Significant is how Judah mentions, throughout the entire *Dialoghi*, only Plato, Aristotle, Plotinus, Maimonides, Ibn-Gabirol called Avicembron, Avicenna, al-Farabi, al-Gazali, Averroes and, once, the Jewish kabbalists (Pines 1983). In particular, Judah appears to be acquainted with Aristotle’s *Physics* and *Metaphysics*, with Maimonides’ *Moreh nevukhim*, and obviously with Plato’s *Timaeus* and *Symposium* (Feldman 2005). Judah, who composed his *Dialoghi* in Italy, appears influenced by contemporary authors and in particular by the Florentine Neoplatonic Academy philosophers and their philosophies of love, as well. For instance, Pines (1983) and Gershenzon (1992) estimate Ficino’s *Commentarium* in Convivium Platonis de amore as the principal Christian source of Judah’s thought. Interesting is the hypothesis of a sort of acquaintance or a friendly relationship between Giovanni Pico and Judah because of a document recorded by the physician Amato Lusitano, who met Judah’s grandson in the second half of the sixteenth century in Salonika (Leone Ebreo 1929a, *Regesten*, VI, Nr. 13). Judah’s grandson seems to have come into possession of a work about astrological themes, *De coeli harmonia*, written by the very Judah in *scholastico stilo* (probably in Latin and in the form of a tractate) upon request of the “divine” Pico della Mirandola. The issue is quite problematic, and some scholars have looked at Pico’s production in search of references to Judah. Actually, in Pico’s *Disputationes adversus astrologiam*

divinatricem, Pico talks about an illustrious man and renowned mathematician, a certain *Leo Hebraeus*. However, most scholars believe that Pico was referring to Levi ben Gershon, who lived in the fourteenth century. One of the main problems of a direct relationship between the Italian and the Portuguese is the fact that Pico died in 1494, only 2 years after Judah’s arrival in Italy, and that the *De coeli harmonia* is today lost. Thus, some scholars believe that the “divine” Pico mentioned by Judah could rather be Giovanni Pico’s nephew, Gianfrancesco Pico della Mirandola (Leão Hebreu 1983). Nevertheless, what should matter is to understand if and to what extent Giovanni Pico could have influenced Judah’s thought.

One of the key features that Judah shares with Giovanni Pico and more in general with Ficino and his followers and the Florentine Neoplatonic milieu is the idea of a *pax philosophica*, i.e., philosophical peace, in other words the belief that different philosophical and religious traditions, by means of the *prisca theologia*, proclaim the same truth and that their differences are only superficial and not essential. If on the one hand a peace seems to be established between Plato and Aristotle in a sort of, as Veltri (2009) says, *reductio ad Platonem*, which is, for example, one of the central concerns in Pico’s thought, on the other hand, this does not appear as the principal purpose in the syncretistic thought of Judah, but rather as the natural consequence of the authentic core of his philosophy: the concordance between the ancient philosophers and the Mosaic teachings and, more generally, between philosophy and religion. In particular, we should remember the long digression about the pagan cosmological myths in the second dialogue (Gershenzon 2000) and the parallel exegesis of Plato’s myth of the androgyne and the Mosaic *Genesis*, which demonstrate Judah’s in-depth knowledge of both Scriptures and Plato’s dialogues. Judah declares that the pagan fables are not untruthful or deceitful, because under the veil of enigmatic metaphors and allegorical words they tell the same truth of the biblical stories. The cryptic and fanciful tegument is a linguistic instrument used by the ancient sages to hide the

marvelous truths about the cosmos and the divine. The different levels of reading of ancient myths distinguished by Leone Ebreo are similar to those of the Christian and Jewish exegetic tradition. Noteworthy in Judah's interpretation of the pagan cosmological stories is his humanistic spirit, in which his acquaintance with the Renaissance hermeneutic tradition and the mythological work of Boccaccio's *De genealogia deorum gentilium* surfaces (Vila-Chã 2006). Some scholars, such as Veltri (2004, 2009), Guidi (2011), and Hughes (2012), have observed that the coincidence between the ancients and the Mosaic Law should be read as a submission of the ancient myths and philosophies to the Jewish highest truth. Similarly, Lesley (1992) believes that the *Dialoghi* should be interpreted within the Jewish debate on this issue and that Judah's work endorses Yoḥanan Alemanno's idea of unity of the truth in contrast to the double-truth theory supported by the contemporary Aristotelian thinker, Elijah Delmedigo, and the Cretan philosopher, Saul ha-Cohen Ashkenazi. On the contrary, Bonfil (1996) argues that the *Dialoghi* cannot be conceived as an example of Jewish apologetics.

It is undeniable that also Leone's *circulo amoroso* recalls Florentine Neoplatonic ideas and, in particular, Ficino's *circuitus spiritualis* (Gershenzon 1992). However, according to some scholars, it could be influenced by Yoḥanan Alemanno's kabbalistic theory of love. The Jewish kabbalist composed an exegetical work on Solomon's *Song of Songs* at the instance of Giovanni Pico. A treatise on love in Hebrew, Alemanno's *Heshek Shlomo* (*Desire of Solomon*) discusses the question of the cosmic love, stressing the ascending and descending love movements and the concept of the final union of the human soul with God. Indeed, Idel (1978) believes that the circle symbols of the *Dialoghi* derive from the Arabic al-Batalyusi's *The Book of Intellectual Circles* mediated by Alemanno's work. However, there is no evidence of a direct recall to Alemanno in the *Dialoghi*, even if Idel (2005) believes that Judah could know Alemanno's *Heshek Shlomo* since Alemanno lived in Yehiel da Pisa's house during the years of the epistolary communications between Yehiel and

Judah's father. In more general terms, Idel (2005) sustains the presence of a persistent Kabbalah influence and especially of the *Sefer ha-zohar* on several central issues of the *Dialoghi*. The question of a considerable weight played by the Kabbalah in the genesis of Judah's philosophy is pivotal not only in Idel's studies on Leone Ebreo but also, in particular, in Ariani's (1984) and Gluck's (2012). However, as Ogren (2016) highlights, scholars should caution against what he calls an "over-Zoharization" of the *Dialoghi*, since there are no explicit references to the *Sefer ha-zohar*.

The supreme and final union of the human soul in and with God is the most relevant element in Judah's philosophy, grounded on the terminological and ontological definition of the notions of desire and love. Based on knowledge, because we can only love what we know, the union of man with and in God is an erotic-intellective union (Damien 1971; Guanti 1978–1979; Perry 1980; Dorman and Levi 1985; Koder 1995; Hughes 2004; Vila-Chã 2006). However, there is also a knowledge that is caused by love. Indeed, knowledge is love, and love is knowledge. For this reason, Leone defines the last and perfect step of the human love and of his intellective path as *fruzione unitiva*, an intellective copulative act or unitive cognition, a loving contemplation of and within God, going beyond the limits of both rationalistic or cognitive happiness and voluntaristic or ecstatic bliss.

To conclude, Judah in his *Dialoghi* debates on many questions developed by philosophers and literati such as Marsilio Ficino; Giovanni Pico; Yoḥanan Alemanno; Francesco Cattani da Diacceto, who is considered Ficino's heir, coetaneous to Leone, and author of *De pulchro*, *De amore*, and the *Panegyricus in amorem*; Giovanni Pontano; Pietro Bembo; and Isaac Abravanel. Hence, Leone Ebreo's *Dialoghi d'amore* represents as one of the most successful examples of sixteenth-century Neoplatonic love literature or, as Santino Caramella says (Leone Ebreo 1929b), of the Cinquecento erotology inspired by Marsilio Ficino's *Commentarium in Convivium Platonis de amore*. For these reasons, even if in his *Dialoghi* Leone does not quote any contemporaneous philosopher, his work, a perfect *trattato d'amore*,

should be rightly placed within the Neoplatonic love debate of his own time.

Impact and Legacy

After the publication of the *Dialoghi* in 1535 and the contemporaneous publication of the second dialogue by Leonardo Marso d'Avezzano (Nelson Novoa 2006–2007; Nelson Novoa 2007), Leone Ebreo's work was published in more than 20 different editions up until the beginning of the seventeenth century. Indeed, Aldo Manuzio's heirs printed several versions of the *Dialoghi* between 1541 and 1558 in Venice. It is undeniable that the spread of a conspicuous number of copies of the *Dialoghi* is understandable within the sixteenth-century literary and philosophical phenomenon of love literature, which became particularly popular and *du jour* in the Italian courts. However, the *Dialoghi* is read also beyond Italy and translated in French in 1551 both by Pontus de Tyard and Denis Sauvage, in Latin in 1564, and in Spanish in 1568, followed by other Iberian editions. Quoted by Cervantes and one of the books of Spinoza's library, the *Dialoghi* was obviously read by many Renaissance scholars, such as Benedetto Varchi and Michel de Montaigne, and Jewish Renaissance scholars, such as Azariah de' Rossi and Joseph Solomon Delmedigo, till Schiller and Goethe, who read it in the *Artis cabalisticae, hoc est, reconditae theologiae et philosophiae scriptorium*. The impact of Judah's philosophy of love on the following philosophers is as yet not a subject of research, although scholars believe that Judah's ideas of love may have directly influenced Giordano Bruno's heroic furor and Spinoza's *amor Dei intellectualis* (Vila-Chã 2006).

Abril, Pedro Simón

Born: around 1540, Alcaraz, Albacete, Spain

Died: 1595, Medina de Rioseco (Valladolid)

Alejandro Coroleu

Faculty of Arts, Department of Catalan Language, Universitat Autònoma de Barcelona, Barcelona, Bellaterra (Cerdanyola), Spain

ICREA-Universitat Autònoma de Barcelona, Barcelona, Spain

Abstract

Pedro Simón Abril's production included grammars for learning Greek and Latin as well as translations of classical works, reading

and writing primers, and notes for the improvement of teaching. He is best known for his Spanish version of Aristotle's *Ethics*.

Biography

Most probably of Jewish ascendancy, Pedro Simón Abril acknowledged being 41 years of age in his *Latini idiomatis docendi ac discendi methodus*, which appeared in 1561. Even though we do not know where Abril took his university studies or which academic degree he obtained, he must have studied at least philosophy, rhetoric, and Greek as he referred to himself as “licenciado” in all these three disciplines in works published in, respectively, 1577, 1584, and 1586. The dedicatory letters appended to his grammar handbooks and to his translations of the classics, as well as other external documents, help us to trace Abril's teaching career, which took him to several institutions throughout Spain. In 1566 he began his teaching activities in the *Studium* at Uncastillo (Zaragoza). Four years later he was sued by the University of Huesca in Aragon for teaching Arts when he was only allowed to teach Latin. In 1571 he was hired by the local authorities at Tudela, near Pamplona, to provide teaching in grammar, rhetoric, poetry, Greek, logic, and metaphysics. Three years later Abril was appointed professor of rhetoric at the University of Zaragoza where he remained until 1576. After spending several months at El Escorial, where King Philip II praised his translation of Terence, he relocated to his home town of Alcaraz (Albacete) and became local preceptor. In August 1583 he was appointed professor of grammar at the University of Zaragoza. Information about later teaching positions is scarce. He must have been reacted to institutions in Madrid and Alcalá de Henares, cities where some of his later works were published. Toward the end of his life, he relocated to Medina de Rioseco in whose *Studium* he must have taught grammar. In 1594 he was summoned by the University of Salamanca to prepare a Latin grammar for the use of local students. This grammar handbook was to be written in Spanish, thus following Abril's own recommendations to

employ the vernacular in the teaching of classical languages.

Reprinted time and again, Pedro Simón Abril's Latin grammars and translations of Terence's comedies, Cicero's letters, Aesop, and Greek drama (Euripides, Aeschylus) are closely linked to his teaching career at different levels in several academic institutions throughout Spain. His teaching materials were designed to teach the usage of classical authors through translation, parallel texts, and comparative grammar. In his best known philosophical translation, his version of Aristotle's *Ethics*, whose preface was addressed to King Philip II of Spain, he outlined his translation methodology: “el que vierte ha de transformar en sí el ánimo y sentencia del actor que vierte, y decirla en la lengua en que lo vierte como de suyo, sin que quede rastro de la lengua peregrina en que fue primero escrito.”

Abu al-Faʿl

► [Abū'l-Faʿl](#)

Abū'l-Faẓl

Born: 14 January 1551, South Asia

Died: 22 August 1602, South Asia

A. Azfar Moin

Religious Studies, The University of Texas at Austin, Austin, TX, USA

Abstract

Abu'l-Faẓl 'Allāmī (14 January 1551 to 22 August 1602) was the most important courtier, advisor, spiritual devotee, and close friend of the powerful Mughal (also called Timurid) emperor Jalāl al-Dīn Muhammad Akbar (r. 1556–1605). He played a central role in the emperor's articulation of a cosmopolitan and religiously inclusive vision of empire that endured for nearly two centuries in South Asia.

Alternate Names

[Abu'l-Faẓl ibn Mubārak](#); [Abu al-Faẓl](#); [Abul Fazl](#)

Biography

Abu'l-Faẓl 'Allāmī (14 January 1551 to 22 August 1602) was the most important courtier, advisor, spiritual devotee, and close friend of the powerful Mughal (also called Timurid) emperor Jalāl al-Dīn Muhammad Akbar (r. 1556–1605). He played a central role in the emperor's articulation of a cosmopolitan and religiously inclusive vision of empire that endured for nearly two centuries in South Asia.

Born into an influential scholarly family that traced its origins over six generations to Sind and Yemen, Abu'l-Faẓl joined Mughal imperial service in 1574 at the age of 23. His accomplished father, Shaykh Mubārak, and older brother, Abu'l Faiẓ Faiẓī, already held key appointments at court as religious advisor and poet laureate respectively.

Abu'l-Faẓl's intellectual pursuits and logiopolitical outlook were shaped by his father

who was known for his vast learning, spiritual eclecticism, and innovative interpretations of Islamic law. Early in Akbar's reign, Shaykh Mubārak's enemies had accused him of heresy and sedition because of his links with a millenarian Sufi movement called the Mahdawīyya (lit. messianists) that had swept northern India in the first half of the sixteenth century. To escape persecution, Shaykh Mubārak and his sons had to go into hiding. Yet by the time Abu'l-Faẓl was presented at the Mughal court, the family's honor and influence stood restored. This change in fortune occurred because their free-thinking views on religion and their experiments with various Muslim and non-Muslim spiritual, philosophical, and occult systems of thought had come into alignment with the inclusive principles on which Akbar desired to consolidate his empire in India.

When, two decades later, he composed the grand chronicle of Akbar's reign, Abu'l-Faẓl wrote into the imperial text his own biography. There he stated that even before he met Akbar, he was beginning to see the vanity of dogmatic scholastic pursuits and the chauvinism of depending on only one philosophical or religious point of view. Instead, he wanted to explore the sacred traditions of the entire world. When he met Akbar, he realized that to serve the emperor would allow him to pursue these desires. In his own words, Abu'l-Faẓl described how Akbar became for him a spiritual guide:

[As a young scholar] I almost became selfish and conceited, and resolved to tread the path of proud retirement. The number of pupils that I had gathered around me, served but to increase my pedantry. In fact, the pride of learning had made my brain drunk with the idea of seclusion. Happily for myself, when I passed the nights in lonely spots with true seekers after truth, and enjoyed the society of such as are empty-handed, but rich in mind and heart, my eyes were opened and I saw the selfishness and covetousness of the so-called learned. The advice of my father with difficulty kept me back from outbreaks of folly; my mind had no rest, and my heart felt itself drawn to the sages of Mongolia or to the hermits of Lebanon; I longed for interviews with the lamas of Tibet or with the *padris* (lit. fathers, refers to Catholic priests) of Portugal, and I would gladly sit with the priests of the Parsis and the learned of the Zendavesta. I was sick of the learned of my own land. My brother and other relatives then

advised me to attend the Court, hoping that I would find in the emperor a leader to the sublime world of thought. In vain did I at first resist their admonitions. Happy, indeed, am I now that I have found in my sovereign a guide to the world of action and a comforter in lonely retirement; in him meet my longing after faith and my desire to do my appointed work in the world; he is the orient where the light of form and ideal dawns; and it is he who has taught me that the work of the world, multifarious as it is, may yet harmonize with the spiritual unity of truth. I was thus presented at Court. As I had no worldly treasures to lay at the feet of his Majesty, I wrote a commentary to the *A'ḥyat al-Kursi*, (Quran 2:256) and presented it when the emperor was at Agra. I was favourably received, and his Majesty graciously accepted my offering. (Abu'l-Faḥl paraphrased in Blochmann 2003, 33)

Impact and Legacy

In his long years of service, Abu'l-Faḥl's crowning achievement was the rationalization and enunciation of Akbar's grand imperial vision. While Akbar's grandfather, Babur (d. 1530), and father, Humayun (d. 1556), had moved to South Asia from ancestral Central Asia and founded a conquest state, it was under Akbar that a stable administrative imperial structure took shape. After he had achieved military dominance, Akbar created a successful system of imperial recruitment that incited warrior groups and their leaders in India, Iran, and Central Asia to join his growing empire. In doing so, he did not discriminate based on religious identity but made loyalty to the emperor the key criterion for imperial service. It was this new style of sovereignty that Abu'l-Faḥl articulated in the massive *Book of Akbar* (Akbarnāmā).

The *Book of Akbar* was a chronicle of chronicles written in a highly stylized form of court of Persian, the third volume of which was called the "Institutes of Akbar" (Ā'in-i Akbarī), a detailed gazetteer and manual for running the empire. These texts, illustrated by the leading painters of India and Iran, had no precedent in content or form in India or elsewhere in Muslim Asia. Through them, Abu'l-Faḥl monumentalized a major feat of state-building in the early modern world.

However, Abu'l-Faḥl's success and his close alliance with the emperor came at a price. Like his father, Shaykh Muḥarak, he too was accused of straying from Islam when he lent his support to a religious scheme initiated by Akbar that resembled, among other things, the messianism of the Mahdawīyya. There is much to indicate that to build an imperial polity on universal principles, Akbar had decided to move beyond the legal tenets of Islam (Moin 2012, 130–169). Instead, he turned to a cosmology of sacred kingship that drew upon the saintly customs of Sufi Islam and forms of cabalistic and Hermetic knowledge. Driven by such forms of custom and knowledge, Akbar chose the end of the first Islamic millennium, which coincided with his reign, to style himself as a universal saint and sovereign, a messianic being above the distinctions of all religion. Members of the court and all others who wanted to devote themselves to the emperor were invited to accept him as a spiritual guide. Although this millennial scheme was merely called discipleship (*murīdī*) in Akbar's official chronicle, it was later remembered as an attempt at a new religion, the so-called Dīn-i Ilahī or Tawhīd-i Ilahī (Divine Religion or Divine Monotheism). Abu'l-Faḥl, his brother, and his father were instrumental in giving Akbar's spiritual program coherent cosmological and ritual shape. Indeed, Abu'l-Faḥl can be considered the chief ritual specialist of the Mughal imperial cult.

Soon after Abu'l-Faḥl's appointment at court in 1574, the emperor had begun to hold debates among scholars of religion in a hall constructed especially for the purpose, the House of Worship ('Ibādat Khāna). Abu'l-Faḥl participated in these discussions and apparently embarrassed Muslim scholars much senior to him. He also described some of these discussions which involved not only Muslims of various sectarian and Sufi persuasions but also Hindus, Jains, Zoroastrians, and Jesuit missionaries invited from the coastal region of Goa for this express purpose. According to Abu'l-Faḥl, Akbar took a particularly keen interest in the religious learning and painted icons of the Jesuits. The emperor also invited them to challenge their Muslim rivals by undergoing an ordeal by fire. Notably, Abu'l-Faḥl described the

Christian priests in a positive light by stating that it was his Muslim coreligionists who were too cowardly to take up the challenge.

By 1579, under the combined onslaught of the emperor and his savant, the conservative old guard of Muslim intellectuals lost its status and influence at court. The emperor declared himself better qualified than any scholar of Islamic scripture to interpret the law. A decree (*maḥẓar*) to this effect was drafted by Abū'l-Faḡl's father and signed by other senior Muslim scholars, affirming Akbar as the chief jurisconsult or *mujtahid* of the age, a supreme authority capable of using reason in matters of scriptural law. That the emperor was not even literate was considered no obstacle in this case for, as Abū'l-Faḡl explained, he was the most spiritually accomplished being of the world and as such enjoyed a status far above the "paper-worshipping scholiasts" of his land (quoted in Moin 2012, 139).

Abū'l-Faḡl justified Akbar's status as chief jurist of Islam by placing the position itself lower in a spiritual hierarchy at the apex of which stood the saint of the world. The emperor, he explained, had simply kept his true spiritual status hidden behind a veil and unveiled it only gradually, first as prime thinker and judge, and then as the foremost saint. In the court chronicle, Abū'l-Faḡl depicted Akbar as the saintlike messianic being and traced his genealogy to an ancient fatherless birth involving a divine light:

... which took shape, without human instrumentality or a father's loins, in the pure womb of her Majesty Alanquva, after having, in order to arrive at perfection, occupied during several ages the holy bodily wrappings of other holy manifestations, is manifesting itself at the present day, in the pure entity of this unique God-knower and God-worshipper (Akbar). How many ages have passed away!

How many planetary conjunctions occurred,
That this happy star might come forth from heaven!
(Abū'l-Faḡl ibn Mubārak and Beveridge 2005, 1–2:
45)

Such descriptions were not mere panegyric. They were part of a pragmatic program in which the emperor ended discrimination based on religious and sectarian affiliation and opened

the doors of imperial service based on ability and loyalty. This program was enshrined and articulated in the principle of "universal peace" (*ṣulḥ-i kull*), which Abū'l-Faḡl outlined in the imperial chronicle. Under this principle, the state protected the religious beliefs and customs of all Muslim sects and non-Muslim religions. This could only be done, in Akbar and Abū'l-Faḡl's opinion, by raising the body of the emperor above the constraints of any one scriptural tradition, including Islam. By this time, the emperor had already forged marriage alliances with Rajput warrior houses in which Hindu princesses became power Mughal queens without converting to Islam. He had also broken from Islamic custom by abolishing the poll tax on non-Muslims (*jizya*) as well as the tax on Hindu pilgrims. These steps were resisted by certain factions of his Muslim nobility, a resentment that his half brother in Kabul, Mirzā Hakīm, and other rebels tried to capitalize on. However, the emperor subdued his opponents and successfully institutionalized his imperial vision. Since Abū'l-Faḡl was the key intellectual force behind Akbar's millennial scheme, he too had to face the brunt of controversy that followed in which Akbar was accused of trying to replace Islam with his own religion.

During and after the inauguration of Akbar's millennial imperial program, Abū'l-Faḡl served as his chief secretary. It is from Abū'l-Faḡl's pen that the most important imperial correspondence and edicts were issued. We have thus echoes of his thought and deeds preserved in the writings to and by Portuguese Jesuit priests, Safavid Iranian chronicles, and works composed in Uzbek Central Asia.

The connection with Safavid Iran is the most noteworthy, for it is in competition with the Safavid dynasty, which was of Sufi origins and had conquered Iran in the sixteenth century that the Mughals of India shaped their vision of empire. The Safavids knew of Akbar's innovative religiopolitical program and that it was being led by Abū'l-Faḡl. When a group of cabbalistic Sufis called the Nuqtavīs (pointillists), who also espoused a millennial worldview, escaped persecution in Iran to find refuge and favor at Akbar's

court in India, a Safavid court historian blamed Abu'l-Faḡl for making the Mughal emperor a “libertine” (*wasī‘al-mashrab*) in matters of religion (Iskandar Beg Munshī quoted in Islam 1979, 1: 124).

Abu'l-Faḡl served his final years as a senior military commander, leading the Mughal campaigns in the south. By this time, he had made enemies with the rebellious heir-apparent, the future emperor Jahangīr. When Akbar recalled Abu'l-Faḡl to help him deal with his troublesome heir, Jahangīr had him waylaid and murdered. That he was assassinated by the crown prince in the struggle for the throne showed the heights to which this court scholar had risen in power and influence.

Academy of Fame

Valeria Guarna

Sapienza Università di Roma, Rome, Italy

Abstract

The “Accademia Venetiana” was founded in 1557 by the Venetian patrician Federico Badoer with the declared intention of launching a publishing project, which he announced with a sort of advance catalogue, first in the vernacular (1558) and then in Latin (1559), under the title *Somma delle opere che in tutte le scienze et arti più nobili, et in varie lingue ha da mandare in luce l'Accademia Venetiana*. The Academy's designated publisher was Paolo Manuzio, tasked with printing more than 300 titles in 20 different disciplines.

The device chosen for the imprint pictured a winged female blowing a trumpet, perched one-footed on a globe, with the legend “Io volo al ciel per riposarmi in Dio.” The formal title of the institution, chosen by its founder, was the *Accademia Venetiana*, which would soon be flanked, or superseded, by “Academy of Fame,” derived from the device.

Official depositions, dated November 1557 and December 1560, laid out the Academy’s publishing plan, revolving primarily around the printing of Latin and Italian texts and vernacular editions of key works.

The venture had a highly innovative cultural program, giving concrete expression to a new conception of learning, tending to the encyclopedic, according to which scientific, literary, and philosophical knowledge was to be developed syncretically. Simultaneously, the academy aspired to become the recognized organ for the political and social policies of the Venetian government, proposing to offer a “public interest” service aimed at turning young aristocrats into future statesmen.

In August 1561, the Badoer family was convicted of fraud and the Academy consequently closed. Despite its brief life, projects nurtured by the institute would live on after its demise, leaving a lasting impression on the structure of scholarship.

Heritage and Rupture with the Tradition

From the late 1540s, a group of intellectuals would gather at the house of the patrician Domenico Venier in Venice to discuss literary, philosophical and scientific matters. A co-conductor of these meetings was the politician Federico Badoer, who would launch, in a document dated November 1557, a formally constituted institution whose principal scope was to

publish a large number of texts that would constitute a new “library” for the enlightenment of young Venetian aristocrats. The “*Accademia Venetiana*,” as its founder named it, proposed itself to the government of the Serenissima as a potential official cultural organ, offering “public interest” services, including lectures and publications, with the specific aim of training the younger nobility to become the future intellectuals and statesmen of the Republic.

The internal organization was envisaged as imitating that of the human body, whose parts corresponded variously to aspects of the active and the contemplative life. The institutional make-up was divided into four main sectors: science, economics, politics, and oratory, entrusted by Badoer, respectively, to his three nephews, Giustiniano, Giovanni, and Luigi, and to his secretary Mar lupino Mar lupini.

The science sector, representing the main cultural thrust of the Academy, was subdivided into four disciplines – law, philosophy, mathematics, and the humanities, each of which were in their turn broken down into a variety of specializations: future jurists into canon and civil; philosophers into supernatural, natural logical medical, and moral; mathematicians into geometers, arithmeticians, astrologers, musical scholars, and cosmographers; humanists into rhetoricians, poets, and historians. The subdivisions reflect the way that knowledge was conceived at that time, essentially split into the active and contemplative sciences, according to the Aristotelian classification of scientific knowledge proposed in the sixth book of his *Metaphysics* (1, 1025 b1–1026 a35).

The internal disposition of the four “colleges” of the Academy was also reflected in the ambitious multifaceted publishing program printed in Venice in 1558 (in Italian) and again in 1559 (in Latin), entitled *Somma delle opere che in tutte le scienze et arti più nobili, et in varie lingue ha da mandare in luce l’Accademia Venetiana, parte nuove, et non più stampate, parte con fedelissime tradottioni, giudiciose correctioni, et utilissime annotationi riformate* (“*Summary of the Works to be issued by the Accademia Venetiana on all of the noblest arts and sciences, and in various tongues...*”), entrusted to Paolo Manuzio,

appointed the Academy's official publishing house. This catalogue was a manifesto as much as a publisher's list, announcing over 500 titles distributed among 20 disciplines: theology, metaphysics, physics, medicine, arithmetic, geometry, optics, music, astrology, geography, warfare, civil law, politics, economics, ethics, logic, rhetoric, poetry, history, and grammar – an encyclopaedic project in which knowledge was presented as all-encompassing and interconnected.

The distribution of scholarly categories envisaged by the administrative structure and by the division of disciplines within the *Somma*'s ambitious lists testified to the interdependence of the cultural and the publishing projects. It was through its publications, in fact, that the institution would meet the task it had set itself, that is, to perform a genuine civilizing role at the heart of the Republic's governing class, educating young Venetian patricians in both Latin and their own language. The titles it planned to issue included new texts alongside editions of the classics kitted out with a full exegetical apparatus: scientific works by authors ancient and modern (Euclid, Galen, Tartaglia, Regiomontanus); commentaries on Aristotle (Themistius, Philoponus, Simplicius); theoretical and technical writings on music (Ptolemy, Glarean, Aristides Quintilianus, and for the moderns: Lodovico Fogliano and Giacomo Fabro); texts on rhetoric and poetics (Rudolph Agricola, Sperone Speroni, and the speeches of Philo of Alexandria, Plotinus and Cicero).

The plan was for many of the works to be translated into Italian. The Academicians' cultural aims were clearly much influenced by the contemporary linguistic theories of Sperone Speroni, who had elected the vernacular to be *the* language of literary, philosophical, and scientific communication. The transmission of knowledge should henceforth be entrusted to this new instrument, whose reach was closely tied to the growth of printing. The catalogue announced the forthcoming translation of some of the most difficult scientific and philosophical texts both in order to make them better known and with the precise intention of making room for different theoretical approaches without having to definitively espouse

one or the other. The encyclopaedic perspective of the cultural program proposed by the Academy was notable for its pronounced and explicit syncretism. That is to say that the choice of texts had been made with a view to including works representative of multiple critical viewpoints within the same field of knowledge. The *Somma* embraced different historical traditions in philosophy, for example, works of Aristotelian hue were to rub shoulders with Neoplatonic and Hermetic ones, the latter spanning writings attributed to the legendary Hermes Trismegistus, interpretations by Iamblichus and Syrianus as well as Marsilio Ficino's more recent revisiting. The Aristotelian reading-list was slanted towards a rapprochement with Plato, indicated by the presence of commentaries by Syrianus and Simplicius, Themistius and Marco Antonio de' Passeri (called Genova/Genua).

A highly eclectic attitude to all forms of knowledge was as apparent in the theological as in the philosophical sphere. Thus we find authors of reformist bent side by side with Counter-Reformation tracts, here again in token of a syncretic pluralism. It was the intention to print, in fact, texts by Reginald Pole and Jacopo Sadoletto, while works dedicated to Jacob Fugger and Alfonso Carafa were also present. At a time when religious tensions were at their highest, the Academy's conscious publishing strategy was to encourage a dialogue between opposing positions. Similarly, among academic theologians the school of Aquinas was intermixed with followers of Giles of Rome and Duns Scotus.

Innovative and Original Aspects

The encyclopaedic vision outlined in the *Somma* was channelled through a reorganisation of knowledge laid out in visually accessible form so that learning could be the more easily transmitted and taught. The design of the project took shape mainly on the basis of the theories formulated by the Dutch humanist Rudolph Agricola, by the scholar Giulio Camillo, and by the Platonist philosopher Franciscus Patricius. Aristotelian logic seemed to these to be insufficient for dealing

with the latest philosophical and scientific developments, and they therefore sought new cognitive models capable of imposing a different and unifying framework for all knowledge.

In his treatise *De inventione dialectica* (1479) Rudolph Agricola had elaborated what amounted to an “art of thinking,” that is to say a logical/pedagogical method that backed up the tools of rhetoric with reasoning of a dialectical type, involving, for example, the deployment of *topoi* as solid points of reference. The importing of elements of topical logic into the dialectical method, as posited by Agricola, was also to be found in Giulio Camillo’s writings, if explored on different lines, as he too worked towards the formulation of a new rhetoric. In the development of ideas in this reformist direction, marrying logic with traditional rhetoric, Camillo’s *La Topica* was a further attempt towards an ordering and visual representation of creative procedures. Furthermore his “universal theatre of memory” (and therefore knowledge) project, again organized according to the proportions of the human body and presented as a concrete realization of the “memory arch,” profoundly influenced the Academicians’ own ambition to schematize all of knowledge. The Academy’s attempt to give practical expression to Camillo’s idea of a single encyclopedic model was through the *Somma*’s listing of titles, in which the current state of learning was effectively tabulated.

Camillo’s treatise was published for the first time in 1560, edited by Franciscus Patricius, who in the same year formulated his own theory for founding a new rhetoric, starting out from the theories of Agricola and Camillo, in a *Discorso* introducing the *Rime* of Luca Contile. The Platonist philosopher identified the following elements as fundamental: “the hypothesis of a correlation between the structures and development of human discourse on the one side, and the structure of the cosmos and the creative development of divine thought on the other; and an amplified and renewed topical philosophy” (Bolzoni 1981b, 140). Patricius’s notion of a rhetoric renewed by the adjunct of topical philosophy strongly influenced the Academy’s promotion of a didactically oriented, visualized encyclopedism. He was

himself, besides, elected to the Academy and appointed superintendent of St. Mark’s (Marciana) Library, which had been entrusted to the new institution’s management at the end of 1558, thus becoming part of a group already boasting over a hundred *sodales* who had signed up for the venture. These included Paolo Manuzio official printer-publisher, Bernardo Tasso chancellor (Tasso 1733), Luca Contile, director of the sciences committee, Agostino Valier, provost of the philosophers’ committee.

The educational initiative directed at the young Venetian patricians was to consist in public lectures and the recommended reading of key works by ancient and modern authors. The foyer of the Marciana Library, after the Palazzo Badoer the official venue for the academic sessions, also hosted gatherings of writers who found it a congenial forum for discussions of poetic theory and practice. Their theoretical approach to poetry was based on the assumption that it, alongside philosophy, was the repository of an arcane wisdom accessible only to the chosen few, rendering them in effect inheritors of a formulation belonging to the Platonic and hermetic traditions. The poet too could arrive through the application of a range of rhetorical devices at a knowledge of philosophical truth, at the same time, the audience for lyric writing would be provided with the necessary exegetical tools to become themselves sufficiently expert in the mechanics of poetic construction.

As far as rhetorical expression was concerned, the directions mapped by Giulio Camillo tended again to the exploration of a new poetical language. In particular, the speculations in his *Idea del teatro* (1550) on rhetorical devices would favor a certain artificiality in the unmemorable verses of the poets frequenting the Academia Venetiana, such as Bernardo Cappello, Girolamo Fenaroli, Giorgio Gradenigo, Celio Magno, Bernardo Tasso, and Giacomo Zane (Atanagi 1565a, b; Atanagi and Irene da Spilimbergo 1561).

The employment of rhetorical stratagems, allied to the “sapient” reading of poetry, gave rise to a production that alternated between the profoundly serious and “inspired,” freighted with

moral and civil reflections, and a mannered exploration of metrical and stylistic models. The notion of a poetry connected with their lyrical practice looked back to Pythagorean ritualism, according to which truth was not to be arrived at by the multitude. The inspired poet-philosopher was thus a conduit of real knowledge, could be said, in fact, to illustrate and reveal through his poetry the very *idea* of knowledge.

Impact and Legacy

The Academy, then, in the *Somma delle opere* set out its cultural stall, its commendable originality consisting in the desire to embrace disparate, even distant or opposing, philosophical, literary, scientific, and theological traditions, with the intention of representing the totality of learning. At the same time, it proposed the necessity of arriving at a new organization of knowledge in all its aspects and devising the didactic procedures indispensable to its memorization and propagation. The cultural and publishing program was strongly marked by an educative intent that would be realized through the exegetical and philological practices envisaged by the list of proposed titles and equally by a visual apparatus that would accompany some of the more abstruse philosophical works. The pedagogical aspect of the publishing venture would thus bear the main burden of institution's self-imposed ambition, repeatedly declared to the Venetian authorities: that was to provide a "public interest" service.

The Academia Venetiana also made an attempt to export its cultural model and penetrate the foreign book market. On the occasion of the 1559 Frankfurt fair, then as now a key event in the commercial publishing year, it published specially, in Italian and Latin, a catalogue of *Libri, che in varie scienze, et arti nella latina lingua, e nella volgare ha nuovamente mandato l'Academia Venetiana alla fiera di Francfort* ("The Books on the various arts and sciences, in the Latin language and in the vernacular that the Academia Venetiana has lately sent to the Fair at Frankfurt"). This list of the titles so far, or about to be, published, again summarized the main

concerns of the whole project: Aristotelian philosophy in its various interpretations together with the various theoretical currents it had launched (particularly as regards natural philosophy); theology, in variety of forms of the doctrine; and advanced education, civil, and practical as well as theoretical and rhetorical, particular as aimed at young aristocrats.

The fanfares notwithstanding, of the more than 500 titles announced in the *Somma delle opere*, only 23 would actually see the light of day. In 1561, Federico Badoer was indicted for fraud before the Senate, which took the opportunity to lay down that no private institution would thereafter assume a public role. Specifically proscribed, in fact, was the precise scope for which the Academy had been established, to perform a public interest role and become an integral part of the Republic's government, with the status of an official cultural institution. The Serenissima would not in future permit that its name be attached to ventures so patently personal as that of Badoer and his academy.

None the less, the Academy did leave an important legacy for the whole cultural system, transforming the conception of knowledge, which would remain encyclopaedic in character, within a unifying philosophical project, in which different theoretical approaches could coexist. Learning would from now on assume an institutionalized form, organized in line with the reformist pedagogical and logical direction the Academy had proposed, and finding its chosen instruments in the devices offered by the new rhetoric. Elements too of the publishing project outlined in the *Somma* would resurface after its demise, inspiring such publications as: the ten dialogues of Franciscus Patricius's *Della historia* (1560), the two volumes of *Rime di diversi* published by Dionigi Atanagi (1565), Orazio Toscanella's *Bellezze del Furioso* (1574), *Le Rime di m. Francesco Petrarca* edited by Federico Ubaldini (1642), and more. The Academy had embodied impulses and pressures of various kinds and tried to channel them into a single cultural model and a certain institutional form. Although the actual life-span of the Academia Venetiana had lasted less than a half a decade,

the experiment it represented left behind a legacy of integrative renewal in the methods and the form of a “universal” system of knowledge.

Academy, Platonic

Frank La Brasca

Centre d’Etudes Supérieures de la Renaissance,
François Rabelais University, Tours, France

Abstract

The Platonic Academy of Florence has been the subject of many more or less far-fetched interpretations that has created around it an atmosphere of esoteric mystery. The aim of this entry is to give an accurate evaluation of what modern research has succeeded to ascertain about this cultural institution which is frequently invoked by renaissance arts scholars as well as historians of philosophy and religious beliefs (Robb 1969; Field 1988).

Synonyms

Careggi academy or Ficinian academy

Heritage and Rupture with the Tradition

Before we try to describe what the current historiography has named the “Platonic Academy” of late Quattrocento Florence, we need to make a preliminary remark.

One must distinguish the fore mentioned structure (to the extent, as we shall see, that it did really have a material existence) from informal gatherings like those who existed in Florence at the end of the fourteenth and first decades of the fifteenth century and gathered around a personality seen at the same time as a cultural, moral, and theological authority.

This was the case, for example, of the cenacle of young humanists that met in the convent of Santo Spirito (of the Holy Spirit) around the Augustan monk Luigi Marsigli* and the humanist chancellor of the Republic Coluccio Salutati*. Both men have been admirers of Petrarch considered as the father founder of the whole humanist movement.

Some years later, some similar erudite companies are known to have been active in the Roman curia during the pontificates of Martin the Fifth* or around the itinerant court of pope Eugenius the Fourth*.

The Camaldolese convent of Saint Mary of the Angels in Florence which had hosted the famous religious painter Lorenzo Monaco* (Lawrence the Monk), a disciple of Giotto*, was also a place where scholars met around the personality of the general prior of the Camaldolese order, Ambrogio Traversari*, one of the first and most eminent Italian Hellenists of the times who translated into Latin the Greek Fathers and Diogenes Laertius’ *Lives of the Ancient Philosophers*.

None of these institutions were technically speaking “academies” for they had neither explicit scope nor program and we have very few and vague testimonies of their actual discussions or productions (Field 1988).

On the other hand, the Academies of the second half of the sixteenth century like the famous literary Academy of the *Humidi* (of the wet ones), then Accademia fiorentina*, or the Academy of *La Crusca** (of the bran) in

defense of the Italian language were well-structured entities with a determinate and articulated leadership, precise statutes, regular meetings, and accurately calibrated productions.

One could say that the Platonic Academy was a transitional form between those two alternative manifestations of this intellectual and functional manifestations of cultural life.

Innovative and Original Aspects

The starting event that gave the philosopher Marsilio Ficino* the idea to become the animator of such a revival of the environment propitious to philosophical collective and discursive investigation, as it is described by Plato himself in the introduction of his famous and venerated dialogues, was no doubt the council of Florence that took place in 1439 in which the byzantine theologians and philosophers played a prominent role.

One of them Georgius Gemistus Pletho or Plethon* somehow impressed his Florentine auditors and in particular Cosimo de' Medici who, according to Ficino had therefore the idea of founding and funding an institution to spread the neo-platonic philosophy in Florence.

In 1439, Ficino was only a 6-year-old boy and subsequently it was only several years after, in 1462 that Cosimo gave Ficino, now a grown man, a villa in the suburbs of Florence in Careggi, that is reputed to have hosted several banquets "à la platonicienne," in particular to celebrate the supposed date of Plato's death on the 7th of November of each single year.

It was in particular in this villa that was held the famous banquet of 1468 in which the hosts were in turn summoned to comment on Plato's *Symposium*, a fundamental philosophical dialogue on the Nature of love, who as then published simultaneously in a Latin and a vernacular edition, becoming one of the most important document of the European Renaissance philosophy and esthetic that exerted an enormous influence on literature and the arts until the age of Romanticism.

Always according to Ficino, the villa was decorated with allegorical paintings and mottos that evoked philosophical notions and symbols.

The correspondence of Ficino which is now almost published in English (Ficino 1975–2015) allows to cast some light on the identity of the writers, thinkers, artists, political rulers that were Ficino's partners and surely attended one or more of the Careggi occasions.

It must be added that quite recently the great American scholar and specialist of Renaissance Platonism, Professor James Hankins has written several articles in which he expresses his doubts about the very existence of the Platonic Academy and goes as far as to "consign" it "to the dustbin of cultural myths," arguing that the only information we have about it comes from Ficino himself who was very keen to forge such beautiful fantasies about his own personal intellectual itinerary, probably in an auto-apologetic intent to exonerate himself from any suspect of heretical deviation (Hankins 1991; Bredekamp 2005).

In this operation of demystification, Hankins has been recently joined by the German scholar and art historian Horst Bredekamp who defends in an essay (Bredekamp 2005) that "neo-platonism never existed except perhaps in the spirit of posterity."

Although such deconstructionist views may have had the merit to revamp the traditional and naïve image that had been given by the historians of the two past centuries and are still alimented by some esoteric and masonic adepts nowadays, the opinion of the author of the present entry is that the ideological and political aspects of the platonic infatuation of the intellectual elites of the time cannot be neglected if we want to have a correct view of the role played by Ficino and what he called his "Platonic Academy" (La Brasca 1997).

Accademia degli Infiammati

Maria Teresa Girardi

Facoltà di Scienze Linguistiche e Letterature Straniere, Catholic University of Sacred Heart, Milan, Italy

Abstract

The *Accademia degli Infiammati* (Academy of the Burning Ones) was founded in Padua, on June 6, 1540, by Leone Orsini, in partnership with Florentine humanist Benedetto Varchi and Venetian humanist Daniele Barbaro, who drafted the academic statute. The choice of name stems from the *impresa* adopted by the Academy: the image of an inflamed Hercules on Mount Oeta, along with the motto “once

burned, the mortal will go to heaven eternally”, which was meant to signify the search for immortality by means of devotion to scholarship. The head of the Academy was a *prince*, whose election occurred generally every 4 months and whose duty was to schedule lectures, which were usually held on Thursdays and Sundays.

The Academy remained active at least until May of 1542. Despite its brief existence, it is considered one of the most important sixteenth-century academies, because its influence on the culture of that century was ongoing and reached well beyond the Venetian area. This was primarily due to the fact that it absorbed the great philosophical-scientific tradition of the University of Padua; the influence of Pietro Pomponazzi's mentorship, especially by means of his pupil Sperone Speroni; the heritage Pietro Bembo had bequeathed to that area; and the culture contributed by such eminent Tuscan figures such as Benedetto Varchi and Alessandro Piccolomini, who along with Speroni were the leading figures of the Academy. The *Infiammati* pursued a program inspired by a philosophically based system of knowledge that preferably hinged on ethics, rhetoric, and literature, a program to be divulged specifically through the use of the Italian vernacular language and culture. By actively working in order to extend the use of the vernacular to all aspects of knowledge, including philosophy and science, the Academy did not just adjust to new requirements for the dissemination of knowledge; it also set the foundation for a universal vernacular language.

Innovative and Original Aspects and Legacy

The specificity of the long-lasting influence of the Academy on the developments of late Renaissance culture derives from the peculiar cultural physiognomy of Padua: home to a University that had established itself as a prestigious hub of philosophical studies and stronghold of the

Aristotelian-scholastic tradition, but also adoptive home of Pietro Bembo, who in that city had completed his *Prose della volgar lingua* and gathered some of the best Venetian humanists of the time. The scientific-philosophical interests cultivated at the University of Padua and the literary and humanistic interests pertaining to Bembo's heritage were, then, the two characterizing aspects of Paduan intellectual life that found in the Academy their ideal meeting place.

As a matter of fact, among the *Infiammati*, there were famous humanists and literati, prominent faculty of the University, along with promising students of various disciplines. Notable members of the Academy include Cola Bruno, most faithful follower of Bembo, Piero Valeriano, and Girolamo Fracastoro, all of whom joined the Academy in its early days, and literati and poets of the next generation such as Luigi Alamanni, Lodovico Dolce, Pietro Aretino, Paolo Manuzio, Francesco Querini, and philosopher Antonio Lapini. Fellow members and professors at the University of Padua were Giovanni Battista da Monte, professor of practical medicine and humanist as well as friend and colleague of the famous Andrea Vesalio, who occasionally also attended the meetings of the *Infiammati*; the illustrious Siennese jurist Mariano Sozzini; Lazzaro Bonamico, professor of Classics; philosopher Vincenzo Maggi; and young philosopher Bernardino Tomitano, professor of Logic, following in the footsteps of a far more prominent fellow Paduan such as philosopher, literary critic, and poet Sperone Speroni, who had held that same position until 1528 and who was also the last *prince* of the Academy, from November 1541 to the first months of the next year. Joining the ranks of the Academy and actively linking it to the University of Padua were also graduate students of natural philosophy, mathematics, medicine, and law, many of whom with brilliant careers ahead of them: an erudite Hellenist and prospective translator of Vitruvius like Daniele Barbaro, patriarch of Aquileia; Siennese philosopher and literary critic Alessandro Piccolomini, who had already joined the famous *Accademia degli Intronati* in his hometown and who served as *prince* of the *Infiammati*; Venetian Matteo

Macigni who is expert in math and ancient Greek and Latin, Michele Barozzi, and Luca Girolamo Contarini; the jurist Celso Sozzini, son of Mariano; hailing from Istria Latinist Giovanni Battista Goineo and from Vicenza Conte da Monte, soon to become a luminary professor of medicine, with a passion for literature; hailing from Brescia, Fortunato Martinengo, Ippolito Chizzola, and Vincenzo Girello; and Giovanni Andrea dell'Anguillara, Giuseppe Betussi, and Francesco Sansovino. Among the most active members during the Academy's first year of life, there was a small group of young Florentine law students: they were Hellenist and Latinist Ugolino Martelli, who became interested in the Italian vernacular during his Paduan years, as well as Lorenzo Lenzi, Alberto del Bene, and Carlo Strozzi. They were all protégées of fellow citizen of Florence Benedetto Varchi, who had left the city in 1537, because of his republican sympathies, and had made Padua his temporary home and place for study, until March 1541. After returning to his hometown with Martelli and Strozzi, he would have brought to bear his Paduan experience as *Infiammato* on the Florentine Academy, thereby allowing for a fruitful exchange between Venetian and Florentine cultures of the mid-sixteenth century.

The Academy, then, gathered professionals and specialists of various disciplines, such as physicians, jurists, and literati, all with parallel interests in the sciences, philosophy, poetry, and different forms of prose and with a sound humanist education. This allowed the Academy to configure itself as an active interdisciplinary circle. The result was a cultural program placed under the aegis of interdisciplinarity – lectures ranged from philosophy and poetry (Classical and modern) all the way to theology – and bilingualism (Latin and Italian vernacular), especially in the early stages of the Academy's activity, under the rule of *principi* such as Leone Orsini (June–July 1540), Venetian aristocrat Giovanni Cornaro della Piscopia (August–November 1540), Galeazzo Gonzaga (December 1540–March 1541), and Alessandro Piccolomini (April–September 1541). That notwithstanding, it was Benedetto Varchi who inspired the cultural tendencies and initiatives of

the Academy, up to Gonzaga's leadership. As a matter of fact, the responsibility for public lectures rested almost entirely on his shoulders. Between September 1540 and the first months of 1541, Varchi held public lectures in Latin, on ancient Greek and Latin lyric poetry and in the vernacular, on Petrarchan sonnets and canzoni (*Rvf* CCX, CLXXXII, XXIX, LIII), and on contemporary poetry (sonnets by Bembo, Giovanni della Casa, Lodovico Dolce, and Daniele Barbaro). Besides Varchi, there were two fellow Tuscan lecturers: Ugolino Martelli, who devoted two lectures to Petrarch (on *Rvf* LIII and *Triumphus Cupidinis* I) and one to Bembo's sonnet *Se la più dura quercia*, while Alessandro Piccolomini lectured on the sonnet *Ora t'en va superbo*, by fellow citizen of Siena Laudomia Forteguerri.

While the record of lecture tiles and extant texts is still incomplete, at least two observations are in order. The first concerns the canon of modern authors and texts: if Petrarch is obviously preeminent, nevertheless the avant-garde-like choices of the *Infiammati* also suggest a particular interest for coeval lyric poets, from Bembo all the way to a poet like della Casa, who, although still little-known at the time, was bound to going head to head with the great Venetian or even substitute his example of lyric poetry. Varchi's lesson on della Casa's sonnet on jealousy (*Cura, che di timor ti nutri e cresci*) started to circulate almost instantly, especially in Tuscany, and appeared in print already in 1545 in Mantua, contributing to the poet's popularity. As far as Varchi's referenced texts are concerned, the choice fell on examples of lyric poetry characterized by technical difficulty, lofty style, and elaborated conceit (thus pertaining to a less orthodox kind of Petrarchism) and appropriate for an interpretive reading particularly keen on the aptness of modern poetry and of the Italian vernacular to convey also doctrinal content. The second observation has to do with the methodology of Varchi's lessons, where a focus on the content, which is explained in the light of Florentine neo-Platonic philosophy, is made to interact, as is typically the case for Bembo, with particular concerns about form (style and rhetoric). The result is a new typology of an academic lesson – on poetic texts – documenting the quest for a new

prose and language for literary criticism. It will be widely popular also in Florence, in the Florentine Academy.

Varchi's methodological innovations also had an impact on academic lectures of philosophical content. The cycle of lectures on Aristotle's *Nicomachean Ethics* was held from October to November of 1540; also in that case, his method focused on a direct approach to the text, in opposition to many scholastic commentators, whom he considered useless and pedantic and whom he accused of substituting empty exercises with the primary source, obscuring rather than illustrating it and like sterile grammarians placing all their attention on elocution. Varchi instead advocated a direct relationship with the primary source, in order to comprehend it at the literal level and thus explain it clearly and faithfully to the original intended meaning, so as to enable the audience to participate in the search of the truth and thus achieve real knowledge of the content. Varchi's greatest revolution, however, was that of contributing a vernacular translation and comment to the original Greek text of the *Nicomachean Ethics*: he succeeded in the first lesson centered on the meaning of philosophy, but then was forced to give the following lectures in Latin, both due to the high number of foreign students in the audience and perhaps most importantly because of criticism on behalf of uncompromising classicist fellow members, who did not find it acceptable that one would discuss philosophy in the vernacular. Varchi's trailblazing choice was part of a wider program of translation into the vernacular of ancient philosophical texts, particularly Aristotle's works, in an attempt to coin a modern philosophical language that would in turn prove the Italian vernacular to be competitive, also in this field, with respect to the languages of Classic antiquity: during his Paduan years, he attended to a translation and commentary of Aristotle's work on logic (specifically the first book of the *Analytica Priora*), a discipline for which Padua was a prominent center of studies. It was a project that had met the opposition of Florentine humanists and that the Paduan entourage instead encouraged him to pursue, principally Speroni, the person responsible for the favorable orientation of the

Infiammati with respect to the development of the vernacular language and culture. In his *Dialogo delle lingue* – written in the 1530s and widely read by learned Paduans, before it was edited along with the other dialogues by the *Infiammato* Daniele Barbaro (Venice, 1542) – Speroni, who features Pietro Pomponazzi as the principal interlocutor, has him first affirm the primacy of thought and concepts (*res*) over words (*verba*) and then logically justify the substantial equivalence of the different languages for the purpose of scientific and philosophical communication.

Such program – for which Varchi had been inspired by Speroni acting under the influence of Pomponazzi – was later carried on, still under the *Infiammati* banner, by Alessandro Piccolomini, whose experience in the Academy led to a challenging translation project of Classical works, specifically of philosophical and scientific content. It was a project founded on the conviction that divulging knowledge also to those who did not know ancient Greek and Latin had become a necessity. Moreover, the project aimed at elaborating a philosophical vernacular language that could be comprehensible and communicative, not at the expense of scientific accuracy and effective exchange of information. During that same period, in Padua, Piccolomini wrote two tracts *De la sfera del mondo* and *Delle stelle fisse* (both published in 1540 in Venice), which are the first scientific works in the Tuscan language. Other philosophical works in the vernacular ensued (once he had come back to Siena, in 1543, and then to Rome): first and foremost, *L'istrumento della filosofia* was published with the *La prima parte della filosofia naturale* (Rome, 1551), a great philosophical tract focused on logic, where he implemented the teachings of the *Infiammati*, not just with respect to the choice of language but also by electing logic as the basic means to acquire any kind of knowledge.

During his semester-long tenure as *prince* of the Academy, Piccolomini managed to finally put together, with Varchi's help, a cycle of lectures on Aristotle's *Poetics*. The project had been initiated by Leone Orsini, the first *prince*: he had tasked a famous philosopher like Vincenzo Maggi, who, however, had to renounce. The task was

eventually assigned to Bartolomeo Lombardi, a prominent Veronese neo-Aristotelian philosopher. Several impediments, however, including Lombardi's bad health, postponed the schedule between November and December, when Piccolomini had already passed on the baton to Speroni. Lombardi's sickness (which eventually caused his death) did not allow him to go past the proslution to the cycle of lectures, which was eventually held by Maggi. Nine years later, Maggi himself accomplished a great commentary to the *Poetics* (*In Aristotelis librum de Poetica communes explanationes*, Venice, 1550), which was born in collaboration with Lombardi and preceded by his proslution delivered to the *Infiammati*. The Academy, then, was on the cutting edge also with respect to the interest for Aristotle's *Poetics* that exploded halfway through the sixteenth century. To be sure, Piccolomini began an ongoing reflection on poetry and rhetoric that would eventually lead, in the 1560s and 1570s, to translations into the Italian vernacular of the said Aristotelian work (along with a substantial commentary) and of the *Rhetoric*.

Sperone Speroni's tenure as *prince* of the Academy – beginning on October 14, 1541, but made official only one month later (November 13), due to Speroni's own hesitations – marked a turnaround in its history: specifically, a separation from the University of Padua. Such separation was manifested by a program contemplating the exclusive use of the vernacular in formal lectures as well as a notable reduction of the disciplinary scope of the Academy's interests, which were limited to just philosophy, eloquence, and Tuscan poetry. The new course of action was made apparent since Speroni's induction speech, which he delivered in the vernacular. Some highlights of Speroni's leadership were, besides the already mentioned lectures on Aristotle's *Poetics*, lectures on the *Nicomachean Ethics* as well as on the *Rhetoric*, respectively, by Piccolomini and Ugolino Martelli; as for poetry, the interest shifted from lyric poetry to more extensive genres such as tragedy. Sperone himself read excerpts of his *Canace*, which was in progress at the time, to his fellow members. A precious source documenting the new tendencies in the program of the

Academy is *Ragionamenti della lingua toscana* (Venice, 1545 and 1546). A tract cast in the form of a dialogue by Bernardino Tomitano, this work summarizes conversations held at the Academy, after Speroni's election, between Speroni himself, some fellow members, and a group of students of the University of Padua. Following in the footsteps of his teacher (Pomponazzi), Speroni justifies the preeminence of philosophy in the Academy's program by postulating that philosophy has a primary role in the quest for truth and wisdom, which are goals that also professionals dealing with words, such as orators and poets, strive for, in order to achieve, through the specificity of their own language – which differs from philosophy – the civic duties assigned to them. This also applies to modern poets and orators, who use the vernacular, which in turn needs to be promoted and developed, so that it may be able to become more sophisticated conceptually and thus equal to the ancient languages; the part of Speroni's academic program devoted to rhetoric and Tuscan poetry intends to serve precisely to that purpose. Thus, Speroni's reflections, as formulated under the auspices of the *Infiammati* and formalized by his pupil Tomitano, bring to the fore the distinction of languages – the proper language of philosophy and the proper language of poetry and oratory art. Similarly, coeval *Infiammati* readings of Aristotle's *Poetics* focus on comparing and contrasting philosophy, poetry, and history. This is one more aspect that reveals the impact of the *Infiammati*, given that the process eventually leading to the specialization of disciplines did begin halfway through the sixteenth century, exactly by defining the specificity of different languages serving different purposes.

Abstract

Donato Acciaiuoli was one of the best known humanists, politicians, and orators in the age of Lorenzo de' Medici. He frequented the most important humanists of the time and was part of the *Accademia Fiorentina*. His literary

activity was primarily focused on commenting and translating into Latin the thoughts of Greek writers, especially philosophers and historians. He commented on the *Ethics* and the *Politics* of Aristotle, from Plutarch he drew the lives of Alcibiades, Demetrius, Hannibal, and Scipio, and he translated into Italian, as appointed by the *Signoria* of Florence, Leonardo Bruni's *Historiae Florentini populi*. He was also personally involved in Florentine political life, contributing to the development of the Medici policy. He was Vicar of the Casentino and Poppi, Superintendent of the Florentine Studio, Ambassador, as well as Standard-Bearer of justice. At his death, the 28 August, 1478, Cristoforo Landino composed his funeral eulogy, and Angelo Poliziano wrote the text for his tombstone.

Biography

Donato Acciaiuoli was born in Florence, on 15 March 1429, to Neri di Donato Acciaiuoli, who died shortly after his birth, and Lena Palla Strozzi. Donato and his brother Piero grew up in Michele Felice Brancacci's home, their adoptive father, who, however, was soon exiled for his political activity against the Medici family in 1434.

Donato devoted himself to the study of philosophy, grammar, and rhetoric early in life, having as humanist teachers like Jacopo Ammannati, Brother Angelo of Lecco, and Giannozzo Manetti. Around 1450, he began to study Greek with Francesco Castiglione and continued with Carlo Marsuppini. In 1454, with his brother Piero, Donato joined the *Accademia Fiorentina*, where he met and frequented Ottavio Rinuccini, Vespasiano of Bisticci, and Marco and Antonio

Rossi and where he had teachers such as Poggio Bracciolini and especially John Argyropoulos, with whom Donato had very close relations and whose lessons he noted in the *Expositio super libros Ethicorum*. He married, in 1461, Maria Pazzi and had with her six children: Alessandro, born in 1466; Roberto, in 1467; Cassandra, Caterina, and Lorenzo, in 1472; and Pietro, in 1474 (see Bianchi 1990; da Bisticci 1892; D'Addario 1960; Della Torre 1902; Ferrari 1943; Garin 1950; Mazzuchelli 1753 – 1763; Segni 1841; Tiraboschi 1805).

Donato was an important humanist, politician, and orator, one of the best known in the age of Lorenzo de' Medici. He endeavored to popularize classical culture, especially the Aristotelian philosophy, of which he was one of the last great scholars of the fifteenth century Florence. His literary activity was focused mainly on commenting and translating into Latin the thoughts of Greek writers, especially philosophers and historians. He produced commentaries, largely scholastic in both form and content, of Aristotle's *Ethics*, *Physics*, and the *De Anima*, all drawn from Argyropoulos' lessons, and, in 1467, he drew from Plutarch's lives of Alcibiades, Demetrius, Hannibal, and Scipio. Later, in 1471, he produced his own commentary of Aristotle's *Politics*, commissioned by Federico of Montefeltro, and, in the same period, in 1472, he also completed the translation of Leonardo Bruni's *Historiae Florentini populi* into Italian, as commissioned by the Signoria of Florence (see Bianchi 1990; Della Torre 1902; Field 1988; Gionta 1992; Lines 2002; Mazzuchelli 1753 – 1763; Santini 1922; Staico 1996; Tiraboschi 1805).

In his time, Donato was one of the most important experts of Aristotle and a reference point for the philosophical orientations of Florence during Cosimo's regime and during the transition to the Laurentian regime: a time of great cultural, political, and philosophical changes. In fact, after an initial period devoted to the study of Aristotle's *Ethics* under Argyropoulos' guidance, Donato distanced himself from the master and returned to positions more similar to those of Bruni, as evidenced by the last period of his cultural production, which is characterized by the translation

of Bruni's *Historiae* and by the study dedicated to Aristotle's *Politics*, at that time completely overshadowed by the *Ethics*, but which was one of the highest points of Bruni's activity as a translator and which would later find a large following during the sixteenth century (see Field 1988; Ganz 1982, 1990; Lines 2002; Staico 1996).

Donato was also very involved in the public life of Florence, holding several political offices and actively contributing to the development of the Medici policy. The embassies, more than any other office, were opportunities for him to demonstrate his qualities as a humanist, orator, and skilled diplomat. In 1461, he participated in the embassy led by Piero Pazzi for Louis XI, to whom he presented a *Life of Charlemagne* in Latin, which was then published in Rome in 1470, in the appendix to the Latin edition of *Plutarch's Lives*, and was rewarded by the King with the granting of the titles of Counselor and *Maistre d'Hostel*. In 1462, he was Vicar of Poppi and of the Casentino, and, in 1463, he was Prior. In 1464, he recited the prayer for the death of Cosimo de' Medici, proposing that he be granted the title of "Father of the Country." In 1467, he participated in the embassy led by Luca Pini for the Duke of Milan, Galeazzo Maria Sforza, and, in 1469, he was elected Captain of Volterra, a position he also held in 1477. The following year, he was appointed *Podestà* (Mayor) of Montepulciano and Ambassador at the court of Paul II. In 1471, Donato led the embassy to Sixtus IV to congratulate him on his election, giving Sixtus IV his perhaps most famous oration. Three years later, in 1474, he was Standard-Bearer of Justice and, in 1476, was entrusted with other diplomatic missions in Rome, at Sixtus IV's court, where he was in 1478, during the Pazzi conspiracy. He was suspected of complicity with the Pazzi, but given his consistent political militancy on behalf of the Medici family, the charges were dropped. Indeed, he was entrusted by Lorenzo on a delicate mission in France to probe Louis XI's intentions regarding the Italian situation and to ask his aid on behalf of the Florentines against Pope Sixtus IV, involved in the Pazzi. He died in Milan, on the 28th of August, 1478, while on his way to Paris. His remains were brought back to Florence and buried

in the Certosa. Cristoforo Landino composed his funeral eulogy and Angelo Poliziano wrote the text for his tombstone conspiracy (see D'Addario 1960; da Bisticci 1892; Della Torre 1902; Ganz 1982, 1990; Garin 1954; Mazzuchelli 1753 – 1763; Segni 1841).

Achillini, Alessandro

Leen Spruit

Faculty of Arts and Center for the History of Philosophy and Science, Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

Alessandro Achillini (1463–1512) was a Bolognese philosopher and physician; he entertained a moderate form of Averroism, authored treatises on Aristotelian natural philosophy and commentaries, and also wrote a manual on physiognomics and chiromancy.

Biography

Alessandro Achillini was born in 1461 in Bologna as son of Claudio and brother of Giovanni Filoteo. He graduated in philosophy and medicine at the University of Bologna on September 7, 1484; he taught there logic till 1487 and natural philosophy from 1484 to 1494. From 1494 to 1497 he taught theoretical medicine, and from 1497 to 1506 he covered both chairs of philosophy and medicine. As he supported the Bentivoglio family, he left the city when Julius II entered the city in November 1506 and moved to Padua, where he held the chair of natural philosophy in concurrence with Pomponazzi (Riondato 1988). After 2 years he was forced to leave Padua, and in September 1508 he returned to Bologna, where he resumed his teaching of philosophy and medicine, till his death on August 2, 1512 (Münster 1933; Thorndike 1941; Nardi 1960; Baroncini 1977; Matsen 1975, 1994; Lohr 1988).

Achillini stuck to the Averroistic interpretation of Aristotle's philosophy, in particular, as to the eternity of the world, but he contemporarily endorsed divine providence. He argued that the possible intellect was unique for the whole mankind, but he viewed it as the inherent and “informing” form of individual man. He identified the agent intellect with God and defined the conjunction of the human mind with this intellect as

man's ultimate happiness and beatitude. Therefore, Bruno Nardi qualified his psychology as “Sigerian” (Nardi 1945, 1958). He extensively discussed the “calculatory” doctrines and attempted to accommodate the Aristotelian rules on the proportionality of motion with the motor force and resistance.

In the *Quaestio de subiecto physionomiae et chiromantiae* (1503), also published as premiss to Bartolomeo Della Rocca's *Chiromantiae et physionomiae Anastatis* (1504), Achillini discussed the methodological link between divination and Aristotelian natural philosophy and established that the predictions of physiognomics and chiromancy are not strictly scientific but based on a probable certainty. In Achillini's view, divination is framed in a world ruled by astral influences, but celestial and physical influx determines the sensitive appetite and the organical soul only, not the rational soul and its free will. Also his *Quaestio de subiecto medicinae* (1504) pivots on a methodological issue, namely, the relationships of medicine and philosophy, and again he dwelled on the relation between body and soul (Thorndike 1941; Zambelli 1978).

Other published works include *Quolibeta de intelligentiis* (1494), *De orbibus* (1498), *De universalibus* (in a miscellaneous edition, 1501), *De potestate syllogismi*, and *De elementis* (1505), which were issued in a joint edition in Venice in 1508. Subsequently, he published *Distinctiones* (1510), a fragment of the commentary of the *Physics* (1512), and after his death appeared *De proportionibus motuum* (1515) and *Anatomicae annotationes* (1520). In 1545 his complete works were published in Venice by his student Panfilo Monti (Achillini 1545). His *Anatomicae annotationes*, reprinted several times with different titles, were probably notes for a systematic work on human anatomy (Lohr 1988).

Aconcio, Jacopo

Born: 1520, Trento/Ossana, Italy

Died: 1567, London, England

Fabrizio Meroi

Department of Literature and Philosophy,
University of Trento, Trento, Italy

Abstract

Jacopo Aconcio was one of the most important religious reformers of the Renaissance. His works, in which his religious interests are intertwined with philosophy and science, encompass a critique of Catholicism as well as certain aspects of the Reformation, in a perspective where an affirmation of the idea of tolerance is accompanied by the rejection of all dogmatism.

Biography

Jacopo Aconcio was born around 1520 in the city of Trento or in the nearby village of Ossana. He studied law and practiced as a notary until (probably in 1551) he followed the Archduke Maximilian, son of Emperor Ferdinand I, to Vienna. A few years later he returned to Italy and at the end of 1556 arrived in Milan to work as secretary to Cardinal Cristoforo Madruzzo, who had recently become governor of Milan.

However, in June 1557 his adherence to the reformed religion – an adherence matured during his years in Trento and Vienna – prompted him to flee Italy to reach the land of the Reformation. Thus, he went first to Basel and Zurich (where he befriended Bernardino Ochino) and then to Strasbourg (where he met several English exiles) until in 1559, following the death of Mary Tudor and the ascent of Elizabeth I to the throne, he decided to settle in London. In England, he alternated his work as religious reformer with his activity as expert in military fortifications, until his death in approximately 1567.

Aconcio's commitment as a religious reformer is characterized overall by his harsh criticism of the errors and excesses of Roman Catholicism, but at the same time, also by his strong condemnation of the dogmatic and absolutist consequences of Reformed confessions. His first work, the *Dialogo di Giacopo Riccamati* (previously written in Vienna but later published in Basel in 1558), depicts a close comparison between the character of Muzio, a Catholic totally convinced of his faith, and that of James Riccamati, a good Christian who aspires to know the truth of Christ beyond any confessional rigidity, and also through the exercise of doubt. In this work, Aconcio aims to explain the reasons for his rejection of the Church of Rome and at the same time, rather than set it in opposition to the reformed religion, to simply indicate two essential principles of the search for truth in matters of religion: on the one hand, the use of the word of God – that is, Scriptural text – as the sole criterion for verification of individual opinions, and on the other hand, a willingness to deal with those whose beliefs are different. His identification of the reformed religion as a landing place during the journey in search of truth becomes explicit in the *Somma brevissima della dottrina cristiana*, also published in Basel in 1558. In this work, Aconcio continues to lash out against Catholics and their errors (first of all the unjustified multiplication of sacraments, which according to the Scriptures should be kept to only Baptism and the Eucharist) and outlines the contours of a reformed religion that is more Lutheran than Calvinist, mainly based on direct reading of the Bible, reducing the value

of good works, and on the absolute centrality of Christ's sacrifice for the salvation of man. Finally, in his most famous work, the *Stratagemata Satanae*, which was printed in Basel in 1565 and would enjoy great fortune in the following decades, Aconcio continues his anti-Catholic polemic but now also criticizes the Reformed Churches, to which he imputes an increasing dogmatic rigidity, frequent internal conflicts, and repeated manifestations of intolerance. To combat these wrongs, he proposes a twofold remedy: on one hand, to abandon any theological subtleties and reduce dogmatic apparatus to a few essential truths, that is, those deriving directly from the Scriptures that must be known in order to obtain salvation; on the other hand, constant application of the principle of tolerance – a principle based not on denial of the existence of a single truth, but on the belief that the truth cannot but reveal and assert itself when sought through dialogue based on rational persuasion rather than violent coercion (Rossi 1952).

However, Aconcio's importance in the cultural landscape of the sixteenth century goes beyond the sphere of religious issues. Among his major works should also be recalled *De methodo* (Basel 1558), in which he sets up – following Aristotelian logic interpreted with great originality – a new foundation for the means of gathering and transmitting knowledge, based on the analytical method. Moreover, this strong interest in logical and epistemological issues is by no means foreign to the religious problem. Aconcio's philosophical, religious, and technical-scientific interests spring from a single, fundamental need: to find a solution to the practical, theoretical, and spiritual problems that daily life presents to man, who is always at the center of his perspective. And thus, Aconcio finally appears as a figure whose sincere adherence to the Reformation does not cancel out a basic concept of purely humanistic inspiration (Rossi 1952).

Acoustics in Renaissance Sciences

Carla Bromberg

Independent Scholar History of Science,
Pontifical Catholic University of São Paulo, São Paulo, Brazil

Independent Scholar Department of Mathematics,
Pontifical Catholic University of São Paulo, São Paulo, Brazil

Abstract

During the Renaissance there was no science of sound as we currently understand it. Conjectures about sound were provided by observations of particular acoustical phenomena incorporated in buildings or in open spaces, like whispering galleries or echoes as discussed in architecture. Sound was also a topic of interest for those who studied the functioning of natural bodies (i.e., voice and hearing), artificial instruments and machines (e.g., automata and war machines), among others.

Although sound could not be identified as the subject matter of any science, it was attributed a relevant role in music treatises. It is assumed that the philosophical traditions involved in its study approached sound either as motion or as the object of hearing. However, up to the seventeenth century sound, as part of music, was mostly explored within the Aristotelian framework of subalternate sciences, being studied not as a perceived quality but as the natural quality of number, the actual object of music.

Introduction

Many were the Renaissance authors that approached sound in their writings. Some of these authors attributed more relevance to historical narratives about its origin as represented by the character of Juval in the Bible, book of Genesis, and his invention of consonance; Pythagoras and the invention of consonance; as well as Hugh of St. Victor and the origin of singing.

Narratives about the invention of sound as the invention of musical consonance (agreeable musical intervals) was a recurrent theme found already in medieval treatises up to the late sixteenth century (Bromberg and Alfonso-Goldfarb 2010). The invention of consonance by either Pythagoras or Jubal was transmitted as told by Iamblichus, Nicomachus of Gerasa, and Theon of Smyrna. Such legend was specially well illustrated in the works of Franchino Gaffurio (1451–1522), a music theorist from the fifteenth century. The legend explained that instruments as different as *auloi*, panpipes, and vessels filled to various levels with liquid were showed to yield the same proportional ratios as monochords when subjected to different tensions by attaching weights to them (Gaffurio 1993).

Some Renaissance authors mentioned whispering galleries and echoes as types of sound phenomenon, others were interested in the organ of hearing, and others yet spoke of a certain sound in the cosmos, as was the case with the theory of the harmony of the spheres in which sound was emitted through the movements of the celestial bodies while remaining unheard.

Whispering galleries are a good example of the intersection between building and natural philosophy. Some authors would assert that they had been planned in advance, while others would state that their acoustical phenomena were inherent to the construction and geometric form of the building that contained them. People could experience the same phenomenon outdoors as well, along the circular walls of certain gardens or in fortifications and also in some ancient theaters (Crunelle 1991). It is assumed that a truly geometrical and not an acoustical decision often guided the elaboration of the plans for the aforementioned buildings. The German Jesuit scholar Athanasius Kircher (1608–1680) described this effect in his work *Musurgia Universalis* (1620), a treatise written in a dispute with an English engineer. A second treatise called *Phonurgia* would elaborate on his interest in echoes, which he considered to be founded on sound waves propagated after hitting some obstacle (Tronchin et al. 2008). Nevertheless, the cause of such effects was attributed to geometry. Other natural philosophers, such as Giovanni B. Della Porta (1535–1615), also proposed a geometrical approach to acoustics when analyzing the powerful influence of music on human soul (Barbieri 2004).

Sound was something produced by an external body and was differentiated from voice. Voice was regarded as natural, while the production of other types of sound was considered to be artificial. Whether favoring or challenging Aristotle's division between natural (voice) and artificial sounds (instruments, machines, etc.), authors attempted to recreate sound in automata, speaking machines, and musical instruments. Following Aristotle's notion of perception, sound was also understood as the object of hearing. Authors would approach hearing as a sensory science, like sight; the analogy between sound and light was common among renaissance authors. Natural philosophers such as Francis Bacon, Athanasius Kircher, or Robert Hooke saw in acoustics the way to improve the range of hearing, or to improve communication (Gouk 1982, 2006), Galileo Galilei envisaged a new instrument aiming at bringing to bring sound closer (Valleriani 2012).

Regarding physical theories, it is assumed that the then most prominent philosophy of sound was that sound consisted of a kind of motion, a philosophy inherited from the Middle Ages. The idea that motion is generated by a source, which appeared in the works of Aristotle, was mostly represented in narratives comparing the propagation of sound with the water wave (Johnstone 2013). However, the wave analogy was not unanimously accepted; sometimes authors would not reveal preference for any theory, at other times they would make use of more than one. They admitted that sound could be propagated in a diversity of forms: wave, the scholastic notion of species, corpuscular theory, and atoms. The historiography, however, places the first solution for a sound theory at the moment when discussions about numbers were transformed into questions about vibrational frequencies (Dostrovsky 1975; Cohen 1984). In fact, the vibration theory would be regarded as the first theory of sound in the seventeenth century (Truesdell 1960; Dostrovsky 1975).

Regarding historical documentation, studies about sound have been preserved in music treatises since the Middle Ages. Medieval and Renaissance music was not classified as art but as science based on speculative knowledge and characterized by its mathematical rather than physical nature. Sound was a facet of discussions involving the definitions and demonstrations of music as a mathematical science, yet, in many cases, the perceived acoustical phenomena were also described.

Classifying Sound

Since sound was placed within music, it was in music treatises that definitions of sound appear. Music was based on mathematics, more precisely on the arithmetic of pitch. The arithmetic of pitch meant that sound was defined on arithmetical bases and treated by natural philosophers and theoretical musicians through arithmetical or geometrical analyses (Dostrovsky 1975; Szabó 1978). The arithmetical definition of musical elements was an inherited Pythagorean approach that dominated music theory throughout the Middle

Ages and Renaissance. The mathematical definition of music was a consensus; Plato, Aristotle, and their followers had agreed on it, even though not in the same way (Truesdell 1976; Walker 1978; Cohen 1984; Barker 2007; Creese 2010).

Sound was analyzed solely through differences in pitch – the subject property that enables sounds to be compared with each other in terms of high and low. Aristotle argued that differences in pitch corresponded to differences in the motion of air, thus a low sound would correspond to a slow motion and high sound to a fast motion. No other attribute of sound was correctly identifiable, for timbre could not be completely differentiated from pitch, intensity was confused with pitch and timbre, and because there was no way to measure it outside the realm of music.

Questions about duration, intensity, or timbre were not pressing. The duration of sound was understood to be part of the studies about rhythm, which dealt with identifying time changes and managing the metrics of speech.

Nevertheless, the relationships between differences in pitch (high and low) were understood in terms of proportion. Musical intervals were considered multitudes in relation to one another and were expressible and measured only through integral number ratios. The specific qualification (consonant/ dissonant) and quantification (duple, triple, etc.) of ratios was dictated by textual tradition regardless of practice and experimentation.

Music belonged with arithmetic, geometry, and astronomy since the medieval *quadrivium*, a classification that aimed to define the content and methods of each discipline and to establish the relationships between them (Dyer 2007). The proper order of these mathematical sciences was discussed during the Middle Ages, and two classifications eventually became relevant to music. One was based on Severinus Boethius' (c. 480–524) *De institutione arithmetica* and *De institutione musica* and the second on Martianus Capella's *De nuptiis Philologiae et Mercurii*. For the first author, music was considered to be a mathematical-arithmetical science. Boethius held arithmetic on the highest position among the four sciences (Masi 1983); for Capella, music, although still considered as a mathematical

science, was paired off with astronomy (Masi 1983; Teeuwen 2002). Both treatises were largely commented and received glosses of speculative and philosophical characters. From these glosses it becomes clear that the disciplines from the *quadrivium* were based on the same notions of mathematical ratios (Teeuwen 2002).

Boethius' classification became strongly widespread in music theory during the Renaissance (Barbera 1980). Like Aristotle, he defined scientific knowledge as a doctrine built on first principles and strict demonstration. In his system of sciences, Aristotle had defined music as a speculative mathematical science, yet a science of proportions that possessed a physical component (Aristotle 1984). He had a place for these sciences that were partly mathematical and partly natural, such as optics and music. Music was defined as the most natural of the mathematical sciences (*Physics* 194a7). This view, unknown to the early Middle Ages, was of great relevance to the development of the *scientiae mediae*, specially by Thomas Aquinas (1225–1274).

Regarding the subject of music, that ambivalence meant that number was its essential attribute, but also that it held an improper part, an accident. This accident or quality was sound which came from physics (*Metaph.* 987b27). Authors from the thirteenth to the sixteenth centuries embraced this definition, and expressions such as *numerus sonorus*, *numerus relatus ad sonos* were used in relation to the subject of music by Robert Grosseteste, Albert the Great, and Robert Kilwardby, for example (Rico 2005). Nevertheless, regarding the developments in acoustics, it was with Aquinas that the configuration of music as a subalternate science became more fruitful. He considered the subject of music as a composite entity with a mathematical form and a physical matter, and, by doing so, he adhered to Aristotle's explanation of number as the formal cause of musical consonance. To Aquinas the *scientiae mediae* reach conclusions about sensible matter even though they proceed through mathematical principles.

Robert Grosseteste (1175–1253) also elaborated on the subject matter of arithmetical music. Following the definitions of species of

numbers as proposed by Boethius and in accordance with the *quadrivium*, Grosseteste introduced the *numerus relatus*. The term was introduced in his commentary on the *Posterior Analytics*. In the *Posterior Analytics*, Aristotle assumes that sounds (musical intervals) acquire their particular qualities through their corresponding ratios; however, because Aristotle knew that there was no absolute consensus on this issue, he decided not to carry out an investigation on types of intervals and ratios but, instead, explained that they could be defined in terms of priority of the mathematical over the acoustical elements or vice versa. He therefore called mathematical harmonicists “those who investigate harmonics according to numbers” (*Top.* 107a15–16) and hearing-based harmonicists “those who knew the fact that” (*An. Post.* 79a2–4). Only mathematical harmonicists were in possession of demonstrations of the causes (*An. Post.* 79a2–4) (Creese 2010). When commenting on this difference, Grosseteste associated the mathematical harmonicists with *numerus relatus* and the hearing-based harmonicists with *numerus relatus sonorus*. *Numerus relatus* concerned all proportioned beings (McInerny 1990).

Authors from the fifteenth to sixteenth centuries drew on the views of Aquinas and Grosseteste, now trying to distinguish between ratio, sound, and sounding body. Sounding bodies were not the same as musical instruments; they were elements that produced sound and did not correspond to the whole musical instrument, which involved a much more complex mechanism. Strings, glasses, and tubes were considered sounding bodies.

Understanding Sounding Bodies

Sounding body is a term that appears in Renaissance treatises to name things that cause sound with pitch and therefore fall within musical mathematics. As we saw, theorists were familiar with the Pythagorean doctrine of musical ratios, but to understand the relationship between musical ratios and sound required to know how to attribute magnitude to sound (Saito and Bromberg 2015).

Since magnitude enables a qualitative and quantitative description of concepts through numbers, and given that, (a) magnitudes can be reduced to numbers and (b) measuring involves comparison, the magnitude to be measured must be material (Saito and Bromberg 2015). In music the most important method to render sounds comparable was to make them visible (Creese 2010). This process was achieved through an instrument called monochord, which consisted of a single string stretched over a soundbox, with two fixed bridges, one at either end, and a movable bridge that allowed the string to be divided at any point in between. Under the string were some scales that functioned like a rod or ruler (Greek *kanōn*).

This instrument was known since ancient times, although its function and meaning had changed over time. Again, the medieval theory of the monochord transmitted to the Renaissance was based on Boethius’ writings. The medieval monochord worked as a pitch-producing instrument for singers and appeared in writings aimed at the construction of organs and bells. By the time of the Renaissance, the monochord was still used by singers but was mostly referred to by authors whose works dealt with the construction and tuning of musical instruments (Adkins 1967). The monochord use could be related to the theory of proportions and would dispense with a theory of sound as movement or impact, for it would not enable their measurement.

The behavior of strings or tubes was not known to theorists. Luthiers, that is, instrument makers, would be consulted for information about it. As we saw, there was no theory that could properly account for the acoustic properties of either strings or tubes.

Information on strings and tubes could be found mostly in those works dedicated to the arts of mining, smelting, and metalwork. Vanoccio Biringuccio’s *De la Pirotechnia* (1540) is an example of a technical treatise that included details about organ pipes and a description of the “bell scale” (Biringuccio 1966). Descriptions of instruments with strings of varying types or thickness and varying pipe length, diameter, and volume clearly show how unusual were his distinctions between pitch and number, in particular, the distinction between

pitch production and his definitions of qualities applied to the notion of timbre.

In the first treatise dedicated to musical organology *Musica getutscht* (1511), Sebastian Virdung considered three categories of musical instruments. In the third group, which he called instruments that resound (and that is generically translated as percussion), he included the hammers on the anvil from the legend of Pythagoras, bells and chime bells along with organ pipes, explaining that the functioning and measuring of these instruments followed the proportional theory described by Boethius.

Nevertheless, many treatises were written that described old and new instruments (Vincenzo Galilei, Lodovico Fogliano, Michael Praetorius, Girolamo Cardano, Ercole Bottrigari). In such treatises, even though illustrations and information on the instruments would be given, the knowledge of how to make them would actually not be provided, and there were a number of reasons for that. Sometimes the knowledge would be kept within the circles of luthiers, unavailable for disclosure. But most often authors were either still attached to textual tradition or unable to legitimize their own theories.

Acoustics and Mathematics

Between the fourteenth and sixteenth centuries the acoustical dilemma lied in reconciling the natural argument with the principles of mathematics philosophically embedded in the discussion of subalternate sciences and the possibility of metabasis (Aristotle). In the specific case of music, arithmetic, with its application to the ratios of musical intervals, had to cohere with geometry and its application to the extensions of sounding bodies. Yet, being arithmetic and geometry two different sciences, each one with its own methods, and sound not being measurable as a physical entity, no philosophy or theory of sound enabled analyzing the arithmetics of interval, the geometry of the sounding body, and the reality of sound.

By that time textual tradition had legitimated arithmetic as the prime science. Then, because of arithmetic's concern with number (theoretical

abstraction of the musical interval), which is discrete, and geometry's and physics' similar concern with matter (sounding body), which is continuous, the content of the former was given greater certitude than the content of the latter. Therefore, either the sounding bodies or sound itself would still take a long period of time to become a proper object of inquiry. The theory of proportions also gave an answer to perception. Since agreeable sounds were defined by rational numbers, there was no philosophy of sense-perception beyond the distinction between consonance and dissonance.

The mathematical focus of this discussion is evident from the sources cited in the majority of the documents. The separation of the general magnitudes of geometry from the discrete multitudes of arithmetic was provided in books V and VII of Euclid's *Elements*. The authors of the fifteenth and sixteenth centuries discussed mostly book VII, which contains the demonstration of a purely numerical theory of magnitudes (Murdoch 1963). These authors focused on Aristotle's *Physics* and *Posterior Analytics*, since the subject of natural science is analyzed especially in the second book of *Physics*, which explains how it differs from the object of mathematics and enumerates the types of causes used in its demonstrations.

The need to understand the application of abstract ratios to sounding bodies as relations between parts and of parts to the whole set voice apart, for the voice organ could not be subjected to either partition or measurement. It was probably when authors disconnected the practices of the division of the monochord from the behavior of strings that they managed to develop new approaches to sound. The development of the laws for the natural frequencies of vibrating strings would be relevant in the works of Galileo Galilei (1564–1642), whose *Mathematical Discourses Concerning Two New Sciences* (1638) contained the statement and discussion about frequency equivalence (Dostrovsky 1975) and Marin Mersenne (1588–1648). Nevertheless, prior to the end of the eighteenth century music remained classified as a mathematical science. Even natural philosophers from the seventeenth to early eighteenth centuries considered the

phenomena of sound in connection with music. In the *Two New Sciences*, Galileo still referred to the questions of sound that included vibration, as problems of music.

The transition from the scientific analysis of music in terms of number to an approach with an essentially physical basis is well discussed in literature (Gozza 2000; Cohen 1984) in which it is described all the major natural philosophers from the seventeenth century who devoted themselves also to music as was the case of Johannes Kepler, Simon Stevin, Francis Bacon, René Descartes, Pierre Gassendi, and Isaac Beeckman.

It is assumed that the mathematical theory of sound propagation began with Isaac Newton (1642–1727), whose *Principia* (1686) included a mechanical interpretation of sound as being “pressure” pulses transmitted through neighboring fluid particles. Substantial progress towards the development of a viable theory of sound propagation resting on firmer mathematical and physical concepts was made during the eighteenth century by Euler (1707–1783), Lagrange (1736–1813), and d’Alembert (1717–1783).

Acquapendente, Girolamo Fabrici

Born: 1533, Acquapendente

Died: 21 May 1619, Padua

Alberto Zanatta and Gaetano Thiene
Department of Cardiac, Thoracic and Vascular Sciences, University of Padua Medical School, Padua, Italy

Abstract

Girolamo Fabrici was a physician, anatomist, surgeon, and pupil and successor of Falloppia in the anatomy chair in Padua, where he built the anatomical theater. He is remembered for the exact description of the valves of the veins (without understanding the correct function). His embryological research is also important, and so the observations on the physiology of the muscles of the limbs, the pupil's motility, phonation, uterine anatomy, and childbirth are significant. In the field of surgery, he should be remembered for the tracheotomy and the machines built for orthopedic purposes.

Biography

Fabricius was born in Acquapendente, son of Fabricio. He moved to Padua in 1550 and he obtained the degree in medicine in 1559 (Salvadori 1837).

After the death of Gabriele Falloppia (1523–1562), who was his master, Fabricius was named lecturer in surgery on April 11, 1565, with the obligation to teach also the anatomy, chair that kept for 50 years (Favaro 1911–1912). He maintained the activity of teacher, surgeon, and

esteemed practical physician. He is considered a pioneer in orthopedic field. He was the first anatomist to recognize the importance and the symbolic efficacy of the systematic anatomical illustration, leaving a big colored anatomical atlas. Nowadays, of this atlas remain 211 tables, of which 44 about his publications and 167 unpublished, all preserved in the Marciana National Library of Venice (Rippa Bonati 2015). The first permanent anatomical theater (1595), still preserved at the Bo Palace, is linked to Fabricius' name, and it is considered an emblematic symbol of the demonstrative method in anatomy, and it was the model of other anatomical theaters that were built in the major European universities during the seventeenth century (Favaro 1922).

Fabricius applied the anatomo-comparative method in the anatomical research with great efficacy. He is also considered the father of the scientific embryology thanks to his two books, *De formato foetu* (1600a) and *De formatione ovi et pulli* (published in 1621 after his death).

The *De formato foetu* is a comparative study in which are described the ripest phases of the development in many animal species, with wonderful draws of the pregnant human uterus, extraembryonic tissues, and placenta. In *De formatione ovi et pulli* are illustrated the different phases of chick's development starting from the sixth day, with different and excellent tables, that were considered the best before Marcello Malpighi's ones. It is also described and illustrated for the first time the lymphatic organ of the birds that is called "Bursa of Fabricius".

Fabricius contributed much to the field of surgery, thanks to his descriptions of the tracheotomy procedure, which is similar to that used today. He favored using a vertical incision and was the first to introduce the idea of a tracheostomy tube.

Fabricius highlighted also the passage from descriptive anatomy to functional anatomy with the books dedicated to sensory nervous system, phonation, and respiratory organs: the treatises *De visione, voce, audito* (1600b), *De brutorum loquela* (1603b), and *De respiratione et eius instrumentis* (1615). Fabricius was strongly interested to the problem of biological movement, and

he wrote a little treatise, *De motu locali animalium secundum totum* (1618). His masterpiece is the *De venarum ostiolis* (1603a), in which he systematically studied the valves of the veins, drawing them as first with excellent outcomes, but the function was misunderstood. This book had an important influence on William Harvey (1578–1657), who used some of those pictures and also based lots of his arguments in support of the blood circulation on the function of the valves of the vein (Zampieri et al. 2013).

Innovative and Legacy

About Fabricius' anatomical interests, it has also been observed that he, by dealing with different organs, did not make it clear whether he was talking about man or animal. This also denotes the peculiarity of his approach to that discipline which he wanted to treat in a “scientific” and not empirical manner, namely, describing the structure, function, and “causes” of the organ itself, regardless of whether they belong to man or animal, and therefore according to a concept of science as a true, universal explanation of the causes of the phenomenon in general, though derived from observing it in many different creatures.

Acquaviva, Claudio

Born: 14 September 1543, Atri

Died: 31 January 1615, Rome

Emanuele Lacca

University of South Bohemia, České Budějovice, Czech Republic

Abstract

Claudio Acquaviva (1543–1615) was the fifth general of the Jesuits from 1581 until his death. Very gifted in administrative and political issues, by his election he programmed a precise reformation of the Society, culminated with the publication of the *Ratio Studiorum* in 1586. He faced many controversies, internal and external to his order, and had several clashes especially with Spanish Jesuits, the emperor Philip II, and the popes Sixtus V, Clement VIII, and Paul V. All of them were successfully solved due to his cleverness in politics. He also succeeded in developing the Society in France, the Netherlands, and Flanders. Dead in 1615, he left the Society in its brightest period and contributed to its future survival.

His thoughts and ideas on the governance of the Society are expressed mainly in the two works he personally supervised, *Ratio atque institutio studiorum* (Romae, 1586) and *Industriae pro superioribus eiusdem Societatis: Ad curandos Animae morbos* (Romae, 1606).

Biography

Claudio Acquaviva, the youngest son of the Duke of Atri, entered the Jesuits in Rome in 1567 and thanks to his organizational talent was soon selected as provincial of Naples and Rome. In 1580, the English Jesuit mission asked him to follow it in supporting the efforts of Robert Parsons. Already well-known across Europe, he gained the post of general (the fifth from the birth of the Jesuits) of the Society in 1581. Just after the election, he showed his political and administrative aptitudes and silenced the perplexities pope Gregory XIII had against his abilities. Due to his efforts for the Society and his sharpness in maintaining order in the difficulties, Acquaviva was considered the “second” founder of the Jesuits.

He managed to solve two main challenges caused by the opponents of the Society. The first one occurred in 1586, guided by the Spanish fringe of the Society that, supported by Philip II, aimed to change the basis of the Society itself against his political views. The second one, more intricate, started the next year against the pope Sixtus V, professed enemy of Acquaviva and the Jesuits, on the controversies among Spanish and Italian Jesuits and on the reformation of the Society. Despite the aid given to Acquaviva by the king of Poland, the Duke of Bavaria, and the cardinal Marcantonio Colonna, the pope with his Spanish supporters outclassed him and forced to accept their conditions.

The death of Sixtus V didn't stop the controversy, becoming even worse with the election to the Holy See of Clement VIII. The new pope, opened to the Spanish lands, helped by the Dominicans and afraid of the French politics, agreed to denounce Acquaviva to the Inquisition. The legal process was really slow, and when Clement VIII passed away, the new pope, Paul V, in 1606 opened to Acquaviva and with a detailed procedure of reformation saved him from condemnation, solved the controversy with Spanish Jesuits, satisfied the needs of the Italian fringe, and contributed to create the final order of the Society.

Meanwhile, Acquaviva succeeded in growing up foreign affairs with France, the Netherlands, and Flanders, and in these countries he contributed to increase the political and theological influence of the Society.

He died in Rome on January 31, 1615.

Innovative and Original Aspects

Acquaviva's innovative and original aspects are clearly remarked in two of the works he supervised: *Ratio atque institutio studiorum* (Romae, 1586) and *Industriae pro superioribus eiusdem Societatis: Ad curandos Animae morbos* (Romae, 1606). In these works it is possible to appreciate the intellectual smartness of Acquaviva, helped and guided in his writing by the circumstances he was living in.

The first book represents the document that formally established the new rules of the Society. It was edited in its first version as a collective work made by Acquaviva with six chosen members of the Society: Juan Azor (Spain), Gaspar González (Portugal), James Tyrie (Scotland), Pierre Busée (the Netherlands), Anthony Ghuse (Flanders), and Stefano Tuccio (Sicily). Acquaviva began to think about the book already in 1581, but its biographical events and the time required for its writing delayed its publication by 5 years. In this text, definitively approved in 1599, Acquaviva and its extenders reform the educational activity of Jesuit colleges, from that of Rome to the most remote. There, Acquaviva precisely defined the *cursus studiorum* and the teaching methods to be applied.

The second book contains Acquaviva's teachings on how members of the Society should relate to the people, especially in spiritual matters. This was to avoid the difficulties that could have arisen during their *officium*. However, it also represents a set of cautions that the Jesuits themselves had to take into account, also to not disregard teachings and guidelines proposed by Acquaviva himself.

There are also several letters written by Acquaviva to the Society or addressed to him that are helpful to better understand his thought.

Actio in distans

► Action at a Distance

Action and Contemplation in Renaissance Philosophy

David A. Lines

Italian Studies, School of Modern Languages and Cultures, University of Warwick, Coventry, UK

Abstract

Commentators have often considered a preference for the active versus the contemplative life one of the defining aspects of the Renaissance. This entry points to the long-standing nature of the debate on the possible kinds of life. It also underlines the variety of solutions put forth (also in the Renaissance) and the subtlety of many views (which tended to reconcile the two kinds of life rather than opting for just one of them). Aside from developments in fifteenth-century Florence, where a strong turn toward civic humanism led to exaltations of the active life, the Renaissance saw numerous defenses of the contemplative life and (as a separate category) of the religious life. Throughout Europe, contemplation therefore was often reaffirmed as an ideal, although thinkers rarely believed that one could engage in contemplation exclusively.

Heritage and Rupture with the Tradition

Debates about the relative merits and superiority of the active or contemplative life have been a feature of western philosophy since Plato and Aristotle (a brief survey in Kristeller 1996b, 199–202). In many ways the discussion was similar to that about theory versus practice, or about *otium* (Enenkel and Melion 2011; Vickers 1985), but did not quite coincide with

that on the solitary life (Kristeller 1996b). In Aristotle's account (*Nicomachean Ethics* I and X.7–9, but also VI.5–8), which had an especially strong influence on late-medieval and Renaissance thought, both kinds of life involve the exercise of the intellect: action is governed by the practical intellect or prudence and is strongly connected to the exercise of moral virtue, whereas contemplation is an operation of the speculative intellect. Both have as their object the human and natural world, although speculation is nearer to the life of the gods and seems ultimately concerned with the eternal causes of things (*NE* X.7). Aristotle gives short shrift to the pleasurable life (a third kind of life listed by him), given that it does not result in the *eudamonia* he is interested in (*NE* I.5).

Later thinkers associated the terms “action” and “contemplation” with different activities and gave them different emphases. With Plotinus, the founder of Neoplatonism, the contemplative life came to be identified much more strongly with “the knowledge and contemplation of the divine mind and the divine ideas” (Kristeller 1996b, 201). Christians meanwhile often identified the life of contemplation with a life of meditation and speculation turned toward God. Monasticism, then in its early years, seemed a praiseworthy state, much as Martha (who sat at Jesus' feet) was more worthy than her sister Mary (who bustled about preparing the meal: Luke 10:38–42). In the Middle Ages, the contemplative life thus came to be conceived as something that was exercised by those who had the freedom from worldly cares that enabled them to live a life of prayer and closeness to God. In other words, it became the preserve of the clergy and more rarely of others who were able to combine it with the life of *otium* praised by Romans such as Cicero.

The common stereotype of the Middle Ages as gazing upward while in isolation from the world should, however, be treated with caution. In fact, the theme of the active and contemplative life was warmly debated by several medieval scholastics, including Avicenna (Trottmann 2009), Albertus Magnus (Tin   1995), and Thomas Aquinas (Oliva 2012) – an indication that several opposing views were tenable. In some cases,

the conclusion arrived at is quite different from what one might expect: indeed, Meister Eckhart and Johannes Tauler actually argue for the superiority of the active life (Mieth 1969), as does Henry of Ghent (Macken 1994). But at least three other points about these discussions are important: one is that they do not necessarily argue for the absolute superiority of either of the two lives for man; indeed, Thomas argues for the notional superiority of the contemplative life but then points out that the active one is usually the most appropriate for us (*Summa Theologiae*, II-II, qq. 182 and 188; III, q. 40; Kristeller 1996b, 202). Secondly, as in antiquity, discussions do not assume that the active and contemplative lives are mutually exclusive or discontinuous. Rather, they see individuals as engaging in one or the other in different proportions and ways, depending on their circumstances, status, and other factors. As anticipated by Varro and Augustine (*De civitate Dei*, XIX, 19), the ideal can therefore be to lead a mixed life, in which one type of life is informed by the other. For instance, Thomas viewed an active life (involving, say, preaching or teaching) as a profitable enactment of the knowledge acquired through contemplation (Marenbon 2007, 244–245). This is what Bornio da Sala (†1439), following Thomas, describes as the kind of life (“*vita mixta et fructuosa*”) that Christ chose to lead (Kristeller 1996a, 188–189, 195). Finally, in some instances the contemplative life was given an even stronger religious tinge: again, Thomas sometimes uses it to signify the process by which man, beholding his beloved (God), is transformed in his essence to become like him (Thomas, *Commentum in librum III Sententiarum*, Distinctio 27, q. 1, a. 1; Kristeller 1996a, 190–191) – a perspective sharing elements in common with the Neoplatonists. By now it should be clear that the medieval understanding of the active life could itself be rather distant from the classical one: although the exercise of moral virtue is doubtless part of it, the active life can be equally strongly connected with the outworkings and communication of faith. The contemplative life is often associated with a life of philosophical or theological study but can also carry deeply religious, quasi-mystical overtones.

Innovative and Original Aspects

In the Renaissance this spiritual and religious understanding of the active/contemplative life continued to be debated and to attract followers, not only among the regulars (Harline 1995; Lamy 2011) but also among teachers of philosophy such as Jacques Lefèvre d'Étaples (Enenkel and Melion 2011) and humanists (helpful collections of essays are Vickers (1985), Trottmann (2007, 2009), La Brasca and Trottmann (2011), and Enenkel and Melion (2011)). Yet alongside it another more lay and secular vision developed (Toms Engram 1984). On the one hand, this new model may emphasize more strongly the contemplative life as one of leisure to study and acquire knowledge, as in Petrarch (Toms Engram 1984; Enenkel 1994; Hankins 2018) or Ermolao Barbaro, who includes within it disciplines ranging from grammar to theology (although he excludes eloquence and poetry in his treatise on celibacy of 1472; Kristeller 1996b, 204–205). On the other hand, the active life is interpreted in different ways: some humanists, such as Leon Battista Alberti, underline its social and familial dimension (*I libri della famiglia*; La Brasca and Trottmann 2011). Others, including Coluccio Salutati (Vickers 1985), Leonardo Bruni (Mesch 2016, 80–86), and Matteo Palmieri (Mita Ferraro 2005) – all active in Florence in the first half of the fifteenth century – see the active life particularly in terms of civic and political engagement. This gave rise to Hans Baron's influential interpretation of a Florentine *Bürgerhumanismus* ("civic humanism"; Baron 1966; Kristeller 1996b, 205–208). But here too it is important not to emphasize the one kind of life to the exclusion of the other; what Baron thought he saw was the rise of the politically and socially engaged citizen-scholar, someone able to negotiate the attraction of the life of study with the duties required by the immediate political context. A case in point is the *De dignitate et excellentia hominis* by Giannozzo Manetti, a work that sees a potential harmony between active and contemplative life (Isnardi Parente 1962, 440).

Scholars have debated both the nature and extent of this "civic humanism" as described

so alluringly by Baron (Hankins 1995) and have questioned its legacy. Some have seen Marsilio Ficino's emphasis on Neoplatonic contemplation in the second half of the fifteenth century as both root and symbol of an increasingly unpolitical spirit (Garin 1964); in this context, though, one of Ficino's merits is to reintroduce the existence of the pleasurable life (discussed also by Lorenzo Valla; see Vickers 1985 and called "Christian hedonism" in Nauta 2009, 152–190) and to indicate an individual's freedom to combine the various kinds of life (Kristeller 1996b, 208–210). Others have argued that the second half of the century in general, and the writings of Ficino and even Cristoforo Landino in particular (Lentzen 1991, 2005; Petris 2003), do not amount to a retreat from the earlier emphasis on the active life (Field 1988; cf. Kristeller 1996b, 210–212). But there certainly are clear instances, for instance, in the Aristotelian philosopher Nicoletto Vernia (†1499), in which the contemplative life is favored (Vernia 1947; Nardi 1958, 95–126; Poppi 1964). Many figures took part in the debate (see Schalk 1971, 237–238 for a suggestive listing).

Moving on to the sixteenth century, one again finds voices raised – both in Latin and in the vernacular – in favor of the active life. One such was Pietro Pomponazzi, whose university teaching in both Padua and Bologna made fun of his colleagues' dedication to the abstractions of the intellect and advocated more attention to a life of virtue (Poppi 1970). Pomponazzi's student Sperone Speroni carried forward (and perhaps exaggerated) his teacher's exaltation of the active life, buttressing this through a denigration of the speculative disciplines. He did so in the vernacular, particularly in the treatise *Del modo di studiare* (Speroni 1740, II, 486–502; Poppi 1997, 180–191) and in the incomplete *Dialogo della vita attiva e contemplativa* (Speroni 1740, II, 1–43; Poppi 1997, 191–198), written in 1542. One of the dialogue's speakers, Gianfrancesco Valerio, refers to the three kinds of life as those of the artisans, the virtuous, and the philosophers; but he praises only the second, intermediate group. The others are shown to be too fixated either on production or on speculation (Speroni 1740, II, 26). Another highly relevant example of

the defense of the active life is a highly popular work by the Sienese scholar Alessandro Piccolomini, the *Institutione di tutta la vita de l'homo nato nobile e in città libera* (1542). There Piccolomini, like Speroni a prominent member of the Paduan Accademia degli Inflammati, claims that the contemplative life is in principle superior to the active one. Nonetheless, he states that his attention will concentrate on civic (or active) happiness. This will have a double advantage for the son of the work's dedicatee Laudomia Forteguerri: it will both make him happy and virtuous in the present life and, thereby, allow him to earn happiness in the hereafter (Piccolomini 1542, f. 16r-v; Poppi 1997, 198–205). In this case, therefore, Piccolomini seems to have married a civic and secular active life with the prospect of a heavenly and contemplative one, attainable only after death (Belladonna 1972, 167), as argued by Plato and Thomas Aquinas.

The contemplative life was not, however, without its defenders. A case in point is the *Universa philosophia de moribus* (1583) by Francesco Piccolomini, a Sienese professor who spent his career teaching philosophy at the University of Padua. In his commentary on Book VI of Aristotle's *Ethics*, Piccolomini first provides a survey of the various positions on the preeminence of the active or contemplative life. He then builds on the views of Speroni and his kinsman Alessandro, strongly arguing both for the dignity of theoretical philosophy and for the necessity of combining wisdom and prudence: the two should be kept together like a plant and its fruit, and theoretical philosophy illuminates practical philosophy much as the sun does with the moon (Piccolomini 1583, 300–309; Poppi 1976, 1997, 205–212).

Although Francesco's discussion does not deal at length with theology, it nonetheless has a strong spiritual and religious undercurrent – an important factor in his attempt to reconcile Aristotle, Plato, and other philosophical schools (Lines 2002, 281–284; Kraye 2002). This should not surprise us, coming as it did in the age of Protestant and Catholic reform. Some of his contemporaries tried to argue for the value of the religious ideal by

separating the religious life from the contemplative one. This led to outlining not two but three main types of life. A powerful example is Jacopo Mazzoni's *De triplici hominum vita* (1576), which in addition to the active and contemplative lives analyzes and exalts the religious life as a separate category (Mazzoni 1576, ff. 408v–409r; Leinkauf 2017, passim).

Impact and Legacy

The respective advantages of the active and contemplative lives were also a live issue outside of Italy. Luther's support for a married clergy was based in part on the conviction that ministers should not be far removed from the condition of their flock or pass their lives exclusively in study. In England, the dissolution of the monasteries gave rise to an increased confrontation on the part of the religious with the problems of the active life. One of the most vivid portrayals of the tensions between the two is in Edmund Spenser's *The Faerie Queene* I, 10, where the Redcrosse Knight, first shown the Heavenly City by the hermit Contemplation, is then urged by the same to reenter the world and defeat the dragon. But the problem is also addressed by Francis Bacon and Margaret Cavendish, raising the issue of the relationship of science to contemplation (Summit 2010). The religious dimension of the debate was also relevant to the Jesuits: Ignatius of Loyola's *Spiritual Exercises* made considerable use of both meditation and contemplation (Enenkel and Melion 2011); but of course the point of these exercises was also to repent of or prepare one for how one confronted the challenges of life in the everyday world. The debate in France, while often touching (as in Montaigne: La Brasca and Trottmann 2011) on solitude rather than contemplation more specifically, could be strongly informed by mystical tendencies and love lyric: relevant authors here include Jacques Lefèvre d'Étaples and Maurice Scève (Mazur-Matusevich 2004; Vance 2004; Enenkel and Melion 2011; Giordano 2016). Jean Bodin's *Paradoxon* (1596) offers a full discussion of the religious life as well as of the active and

contemplative ones (Miglietti 2020; see Isnardi Parente 1962 for his other works). A further strain was closely tied to the debate on withdrawing from public life during the Wars of Religion, as is illustrated by authors such as Loy LeRoy and Jacques Auguste de Thou (Isnardi Parente 1990; De Smet 2020). In Spain, as elsewhere, discussions take place both in philosophical and literary works (including poetry). Especially noteworthy is Juan Ginés de Sepúlveda (c. 1490–1573), whose dialogue *Democrates primus* (1535) includes a sustained comparison of the active and contemplative lives. Strongly informed by a spirit of Christian humanism, Sepúlveda concludes that the contemplative/religious life is superior to that based solely on the moral virtues of the active life (Fernández-Santamaría 1977, 172–176). That position is not uncommon among his Spanish contemporaries.

Finally, discussions about action and contemplation are so pervasive in the Renaissance that they are found in many works that may not initially seem relevant. A case in point concerns discussions of climate: basing themselves especially on Aristotle's *Politics* VII and *Problems* XIV, observers distinguish the inhabitants of the earth according to their affinity for production (northern climes), action (temperate climes), or contemplation (southern climes). Significant authors within this tradition include Jean Bodin, Juan de Huarte (especially the 1575 uncensored version of the *Examen de ingenios para las ciencias*, soon translated into numerous languages), Levinus Lemnius (especially *De habitu et constitutione corporis* and *De miraculis occultis naturae*), and Robert Burton (*Anatomy of Melancholy*). The point is receiving increasing scholarly attention, along with studies of climate theory more generally (Glacken 1967; Floyd-Wilson 2003; Miglietti 2016).

The main point to emphasize is that, despite influential views to the contrary (Arendt 1998; see Summit 2010, 529), the Renaissance discussion of action and contemplation not only in no sense devalues contemplation in favor of action, but often regards the two kinds of life as if on a continuum. Furthermore, religious considerations lead to creating a third category in which mystical

and spiritual aspects are separated out of an earthly oriented life of contemplation and scholarly seclusion. If anything, the life of speculation (often inspired by divine love, not plain intellect) comes to be viewed with renewed favor in and after the sixteenth century – a development whose implications for science, medicine, and other fields remain imperfectly understood.

Action at a Distance

John Henry

Science Studies Unit, University of Edinburgh,
Edinburgh, UK

Abstract

Action at a distance, although accepted in occult and magical traditions, has generally been excluded from physics and theology (where it has generally been assumed that even God cannot act at a distance). This article gives a brief account of the acceptance of action at a distance in magical worldviews and in voluntarist theology through the Middle Ages and into the early modern period, where it was most notably promoted in natural philosophy by Francis Bacon and Isaac Newton and in theology by René Descartes and his followers. It ends with a brief consideration of the Newtonian legacy of action at a distance as a major assumption in mainstream physics throughout the Enlightenment and into the modern period.

Synonyms

Actio in distans

Heritage and Rupture with the Tradition

The belief that things could act on other things even across a distance, with no material connection between them, was common in the magical tradition. One of the major authorities on action at a distance as far as learned magicians were concerned was the *De theoria artium magicarum* (*On the theory of the magical arts*) attributed to the Arab philosopher Al-Kindi (801–73) but perhaps written later by an unknown Latin scholar (Adamson 2007). This work, also known under the title, *De radiis stellarum* (*On the rays of the stars*), explained actions at a distance in terms of “rays”: “. . . each thing in this world, whether substance or accident, produces rays in its own way like the stars. . . Hence each place in this world contains the rays of all the things which actually exist in it” (Adamson and Pormann 2012, p. 226). The rays are held to be immaterial, and therefore the bodies emitting the rays are acting not by physical contact but at a distance. The author’s starting point was clearly a belief in stellar influence, but other prominent examples of action at a distance were magnetism and later gravity – both of which exhibited forces of attraction (and in the case of magnetism, repulsion) which could not be affected by a change of surrounding material conditions or cut off by any material barrier (although magnetism could be shielded by iron).

For those who refused to accept action at a distance, there were generally two ways to try to avoid it. The action in question was either assumed to be performed by streams (sometimes referred to as “steams”) of material effluvia (or invisibly small particles) emitted by the active body; or by a successive transmission of the action through a surrounding material medium or aether (Hesse 1963). Both were means of reducing action at a distance to indirect contact action. Often these explanations were as implausible as the magical accounts (especially when dealing with effects which could not be shielded by material barriers or effects at very great distances), but resistance to magic was always very high in the Christian tradition as a result of religious opposition (on the grounds that magical effects were always brought about by demons or even the

Devil himself). But, for the historian, this means that it is often difficult to be sure whether a particular thinker believes in action at a distance or not. A number of thinkers who seem to be assuming action at a distance never explicitly say that they are making that assumption, and so there is always some doubt as to whether they might not be thinking in terms of effluvia or transmission through a surrounding medium. In what follows, we shall concentrate only on those thinkers who explicitly mention action at a distance.

Although Aristotle (384–322 BC) never explicitly discussed action at a distance, his plenist natural philosophy seemed to take it for granted that action could only take place by contact (e.g., *Physics*, VII, 2, 243a 32–35, and VIII, 5, 267b 6–8; *De generatione et corruptione*, I, 6, 322b 28–29, and 323a 33–34). Albertus Magnus (c. 1200–1280) fully examined, and rejected, the possibility of action at a distance (Kovach 1979), and his influential follower, Thomas Aquinas (1225–1274), made it axiomatic for subsequent generations of scholastic philosophers that “a thing cannot act where it is not” (e.g., *Summa Theologica*, Part III, Q. 64, Art. 1, Obj. 3). During the Renaissance, however, the revival of natural magic (stimulated by the rediscovery of the *Corpus Hermeticum*) meant that action at a distance began to appear in the thought of philosophers who believed occult traditions offered the most promising alternative to a scholasticism that was increasingly being seen as misconceived and moribund. Action at a distance can be seen to feature, for example, in Heinrich Cornelius Agrippa’s (1486–1535) *De occulta philosophia* (1533), Girolamo Fracastoro’s (c. 1478–1553) *De sympathia et antipathia rerum* (1546), in the *De abditis rerum causis* (1548) of Jean Fernel (1497–1558), Giambattista della Porta’s (c. 1535–1615) *Magia naturalis* (1558, expanded in 1589), and the *Del senso delle cose e della magia naturale* (1620) of Tommaso Campanella (1568–1639).

Paracelsian claims about the so-called weapon salve also stimulated debate (Debus 2002). The weapon salve was an ointment that was held by its Paracelsian advocates to magically cure wounds when it was applied to the weapon which had

caused the wound, rather than to the wound itself (which was simply kept clean and dry). Anecdotal reports abounded of the effect working even when the weapon and the wounded person were separated by thousands of miles. Presumably many of these anecdotes were simply untrue, but some may well have been perfectly true; and it is not hard, with hindsight, to see why. The standard medical belief throughout the Renaissance period was that a wound could only heal after it had suppurated. Presumably, this is derived from experience; at this time (when antisepsis or asepsis was unheard of), wounds always suppurated before, eventually, healing. Medical intervention, therefore, deliberately provoked what was referred to as “laudable pus” in wounds (to accelerate the healing process) by packing them with caustic or irritant substances. It is easy for us now to see how this could result in detrimental and even fatal results. Treatment using the weapon salve, or the powder of sympathy as it was also called, meant that the wound would simply be kept clean and dry, while the ointment or powder was applied to the weapon or to a bandage soaked in blood from the wound (but then removed away from the wound) if the weapon was not available. Under these circumstances – with the wound left unperturbed by dangerous medical intervention – the wounded person had the best chance of recovery. Consequently, many of the accounts of the success of the weapon salve were based on what seemed like good empirical evidence for its efficacy. For many, therefore, the weapon salve was clearly magical and worked by action at a distance. For others, however, including one of its most famous promoters, Sir Kenelm Digby (1603–1665), it worked by contact action through an elaborate process carried out by material effluvia, even when weapon and wound were separated by continents (Hedrick 2008).

The possibility or otherwise of action at a distance also figured in metaphysical disputes as to whether God could only act where he was present. Debate on this issue was affected by the fact that God was held to be essentially omnipresent. In medieval discussions which carried over into the Renaissance period, there was a wide range of

differing views. For some philosophers, his omnipresence was simply taken as proof that action at a distance was impossible. For others, however, it was supposed that God’s presence, although undeniable, was not required by the fact that he acted on all things (he could will something to happen and it would happen, but his proximity was irrelevant). Similarly, while some argued that God could not act at a distance simply because he *was* omnipresent, others argued that he could act at a distance, because of his omnipotence, even if, per impossibile, he were not present (Kovach 1979).

The main medieval dissenters from the view that God had to be present to act were John Duns Scotus (c. 1266–1308) and William of Ockham (c. 1287–1347). For both thinkers, it was God’s omnipotence that led them to believe in action at a distance. For Scotus the power of God and angels was so immeasurable that they did not have to be present to bring things about (Kovach 1979; Reid 2012). Similarly, for Ockham, God’s will constituted his action – for God, to will something was to bring it about – God’s presence was not relevant to the issue (Kovach 1979). Both thinkers also accepted that action at a distance in physics was also possible. Again, God’s omnipotence meant that he could endow bodies with the power of acting at a distance (Kovach 1979; Goddu 1984).

Innovative and Original Aspects

The concept of action at a distance seems to have had the most impact on mainstream natural philosophy in England (Hesse 1963). Francis Bacon (1561–1626), always ready to embrace magical ideas, explicitly accepted the concept of action at a distance in *De sapientia veterum* (1609) and in his major work of scientific method, the highly influential *Novum organum* (1620). In the earlier work, the influence of *De radiis stellarum* is plain:

there is scarcely anything which is not more or less radiant. This is very plainly seen in the power of vision, and not less so in all kinds of magnetic virtue, and in every effect which takes place at a distance. For whatever produces an effect at a distance may be truly said to emit rays. (*The Wisdom of the Ancients*, “Pan, or Nature”, Bacon 2011, p. 710)

Indeed, his speculations on actions at a distance stimulated the attempt by a number of subsequent English thinkers to develop an explanation of planetary movements. In the *Novum organum*, Bacon made an analogy between magnetism and gravity:

Again, if there be any magnetic power which operates by consent between the Earth and heavy bodies, between the globe of the Moon and the seas (which seems very likely in the half-monthly tidal cycle), or between the stellar heavens and the planets by which the latter are summoned and drawn to their apogees, then all these operate at very long distances indeed. (*Novum organum*, Book II, Aphorism 45)

Bacon's suggestion that terrestrial gravity, the relationship between the Moon and the tides, and planetary movements might be explained by an attractive force similar to magnetism and capable of acting at a distance led a number of fellows of the newly formed Royal Society to develop an explanation for planetary movements along the same lines (Wang 2016). This culminated in the precursor to Isaac Newton's universal principle of gravitation, developed by Robert Hooke (1635–1703) in his *Attempt to Prove the Motion of the Earth* (1674). Hooke wrote to Newton (1642–1727) in 1679 to ask his opinion of this theory, and from then on, Newton too embraced a belief in action at a distance and incorporated it into his theory of gravity in his *Principia Mathematica* of 1687. Hooke and other early fellows of the Royal Society who worked in this area did not explicitly mention actions at a distance, but nor did they try to explain the attractive forces they described in terms of effluvia or the actions of an intervening medium. Newton was similarly silent about actions at a distance in the *Principia*, although continental critics did not fail to notice that Newton's gravitational attraction operated at a distance.

By the time Newton came to publish his second great book, the *Opticks*, in 1704, he had sufficient authority and self-confidence to write explicitly of actions at a distance. The influential *Queries* that he added to the end of the *Opticks* suggested that all physical phenomena could be explained in terms of attractive and repulsive

forces operating at a distance between the particles which constituted all bodies. Even the group of eight extra queries that he added to the 1718 edition, and which suggested explanations for phenomena in terms of an intervening all-pervasive medium (which he called the aether), depended on action at a distance. The aether was held to be so subtle and tenuous that its particles were supposed to be separated from one another (comparing the tenuity of the aether with the densest substance, gold, in which the particles were assumed to be touching one another; Newton concluded that the particles of aether must be comparatively far apart). But if the particles of the aether were separated from one another, then they must be kept apart, Newton insisted, by mutually repelling forces operating across the distance between them (Henry 2011).

The metaphysical arguments as to whether God could act a distance also reappeared in the seventeenth century as a result of René Descartes's (1596–1650) claim that God did not occupy space, since the divinity is a *res cogitans*, not a *res extensa*. In response to critics, most notably the Cambridge Platonist Henry More (1614–1687), Descartes tried to insist that God was omnipresent only according to his power, not his substance. This was effectively the same position adopted earlier by John Duns Scotus, William of Ockham, and other medieval theologians. Later Cartesians, however, such as Antoine Le Grand (1629–1699) and Nicolas Malebranche (1638–1715) tended to concede that God must also be *substantially* present (Reid 2008). Although this might look like a concession to the view that even an omnipotent God could not act at a distance, and therefore a betrayal of the strict substance dualism of Descartes, the real issue for the later Cartesians was that denial of the substantial presence of God might be seized upon by contemporary atheists as a means to deny the existence of God. Accordingly, the later Cartesians did not really abandon Cartesian dualism, but they played it down in their discussions of God, to avoid giving ammunition to contemporary atheists.

It seems clear that the dominant view among theologians, from the Middle Ages through the

early modern period, was that God could not act at a distance, notwithstanding his omnipotence (although there were prominent dissenters from this view, such as John Duns Scotus, William of Ockham, and Descartes). It seems likely that this theological position reflected the aversion to action at a distance as an unacceptably magical notion which can be seen among Christian philosophers throughout the ages. After all, it was theologians who were mostly responsible for the aversion to magic (by insisting that all magical operations and effects were really brought about by hidden demonic activity), so it would be odd if they readily accepted a magical notion like action at a distance even when considering the actions of their omnipotent God. It was always possible, of course, to deny God's ability to do something without compromising His supposed omnipotence, by insisting that the issue in question was logically impossible. For those who defended the idea that God could not act at a distance, action at a distance was simply deemed to be a contradiction in terms.

Impact and Legacy

Generally speaking, opposition to the concept of *actio in distans* was always vigorous and unyielding. It is all the more remarkable, therefore, that Newton managed to introduce action at a distance into mainstream physics for well over a century after his death (Schofield 1970; Henry 2011). The success of Newton's *Principia* ensured that his more speculative claims, in the *Queries* added to the *Opticks*, about attractive and repulsive forces operating at a distance between all atoms, were taken up by succeeding generations of thinkers – mostly natural philosophers, of course, but also including Immanuel Kant (1724–1804) and John Stuart Mill (1806–1873). Reaction against Newtonian action at a distance began to appear in the first half of the nineteenth century and culminated with Albert Einstein's (1879–1955) suggestion at the beginning of the twentieth century that there was no such thing as gravitational attraction and that gravitational phenomena that had

previously been attributed to attraction at a distance were really the result of the bending of space by gravitational masses. Remarkably, however, what Einstein referred to as “spooky action at a distance” almost immediately reappeared in quantum mechanics, as a way of understanding phenomena attributed to the so-called quantum entanglement (Musser 2015). It seems that concepts of action at a distance have a way of reasserting themselves, in spite of obdurate and long-standing opposition.

Acuña, Hernando de

Born: 1518/20

Died: 1580

Elizabeth Ashcroft Terry-Roisin

Department of History, Austin College, Sherman,
TX, USA

Abstract

Hernando de Acuña was a lyric poet of the Spanish Renaissance who spent a number of years in Granada. His sonnets posthumously made him famous, some of which celebrated Charles V as Caesar and were part of the Renaissance of Empire. He also translated a Burgundian chivalric romance from French to Spanish at the request of his emperor. In addition, Acuña served in a variety of military campaigns in the Mediterranean, and he became a knight of the Order of Alcántara.

Biography

Hernando de Acuña was born in Valladolid in 1518/1520 to a family of minor nobility. He was a “poet-soldier,” who served Charles V in battle in Italy, France, and the German lands (García-Arenal 2010, 99–101). Near the age of 17, in 1537, Acuña was fighting the French in Piedmont when his brother, an infantry captain, was killed in the service of the Spanish governor of Milan, Don Alonso de Avalos (Cortés 1913, 37–39). Acuña was at one point captured by Francis I in Piedmont, and also took part in Charles V’s war against Maurice of Saxony (Cortés 1913, 72–73). In the 1540s, Acuña accompanied Prince Philip on his grand tour of his father’s realms. On April 1, 1549, Acuña took part in Philip’s tournament games in the sandy field near Brussels, and was in the “Army of the East” (Frieder 2008, 191–193). Acuña later fought in the Battle of St. Quentin in 1557.

Acuña returned to Spain in the year 1560. He soon married his cousin Doña Juana de Zuñiga.

She was 25, and he was close to 40. From the year 1569 onwards, Acuña lived in the city of Granada (Cortés 1913, 91–95). There he was a member of the literary *tertulia* which met at the home of an elite Morisco, Don Alonso de Granada Venegas, and his wife, Doña María Manrique de Mendoza. The *tertulia* met regularly between 1550 and 1570 and somewhat less regularly later under Don Pedro de Granada Venegas (d.1643) (González Vázquez 2010, 415). In the *tertulia*, Acuña interacted with elite Morisco patrons and their friends, the Mendoza family, as well as the poets Juan Latino, Gregorio Sylvestre, Luis Barahona de Soto, and Gaspar de Baeza. Hernando de Acuña died in Granada in 1580. His wife Doña Juana de Zuñiga published his poetry in 1591.

Historiography: Heritage and Rupture with the Tradition

To interpret Acuña, it is necessary to understand the cultural activities of his social class. There are a number of narratives for what was happening to the minor nobility during his lifetime. Historian Helen Nader would argue that Acuña was part of the “caballero Renaissance” – a movement which had been begun by many of the sonnet-writing nobles in the fifteenth century, including members of the Mendoza family (Nader 1979, 138–142). The Mendoza were deeply ensconced in the military and noble leadership in Granada. They were the guardians of the Alhambra palace, and served as Captains General over the troops stationed there. The Mendoza were close associates of the elite Morisco Granada Venegas family, whom the crown had put in charge of the other major Nasrid palace, the Generalife. Nader argues that in the sixteenth century, humanism moved from noble households to the universities (Nader 1979, 145–149). Yet the Granada Venegas’ *tertulia* met in the late sixteenth century. There Hernando de Acuña interacted with other poets and his hosts, Don Alonso de Granada Venegas, his wife Doña María Manrique de Mendoza, and their family members.

These relationships were manifest in the literature itself. Literary scholar Narciso Alonso

Cortés has identified the true identities of speakers in a dialogue poem by Luis Barahona de Soto, “Pilas,” “Damon,” and “Lauso,” as Don Alonso de Granada, Hernando de Acuña, and Barahona de Soto (Cortés 1913, 96–97). Furthermore, Helen Nader has argued that the caballeros were ultimately eclipsed politically by the letrados – educated lawyers – over the course of the sixteenth century, as letrados began to hold more important positions at court. For Nader, the caballero Renaissance was a short one, ending in the early sixteenth century. Her caballeros had a more pluralistic worldview than the letrados, who were more closely aligned with the Inquisition (Nader 1979, 135). Historian Richard Kagan has shown in his research that the number of letrados increased over the course of the sixteenth century (Kagan 1974).

For literary scholar Leah Middlebrook, however, it was not that caballeros were becoming eclipsed by university-educated letrados. Rather, the caballeros’ role was changing from knight to courtier (Middlebrook 2009, 2–3; See Elias 2000). Acuña, in his lyric poetry, practiced these “techniques of self-restraint,” which were part of courtierization. Middlebrook argues that the Renaissance lyric genre was modern due to its interiority and its focus on the individual (Middlebrook 2009, 17).

Central to scholarship on Renaissance lyric is the role of Italian Petrarchan models. These models were reinterpreted in Castilian in a spirit of competition that contained both a fear of inferiority and an expression of national and linguistic pride (Navarrete 1994).

Literary scholars are not in agreement over whether lyric or epic was a more fundamental genre to the culture of the Spanish Renaissance or over which gave a better ideological defense of empire. According to Elizabeth B. Davis, “Even when re-examined as the product of a specific political milieu, the Italianate lyric of Garcilaso and his followers cannot presume to narrate the story of Spain’s new imperial polity in search of legitimizing myths. That narrative function corresponds more properly to the epic, a genre central to Golden Age cultural practice but not read much

today” (Davis 2000, 2). Following Davis, Elizabeth Wright has helped to make the Latin epic, the *Austrias Carmen* of Juan Latino available in English, and has published a monograph on Latino’s life. In contrast, Leah Middlebrook has argued that “the cultural framework that surrounded this poetry [the epic] had been eclipsed” by the lyric (Middlebrook 2009, 58).

Putting this in social context, Luen-Gen Liang has recently reexamined the role of the Spanish nobility in crafting the Spanish Empire itself. According to Liang, noble families, like the Fernández de Córdoba, actually took primary roles in running the Spanish Empire – they were not eclipsed by letrados and they were not merely courtiers who had lost their military function – rather they were viceroys, governors, and generals who acted as agents in the creation of the Spanish Empire throughout the sixteenth century. These early modern nobles continued to take active military roles, both in expanding and in governing the empire in the Mediterranean and elsewhere (Liang 2011).

Innovative and Original Aspects

Hernando de Acuña is well-known today as a poet. He wrote lyric poetry, and the most famous of his poems was dedicated to the emperor Charles V, “Al rey, nuestro señor,” which expressed the idea that Spain was on the brink of a golden age (Padrón 2006; Fernández, Díez, and J. Ignacio 2011). In this poem, Acuña created an image of Charles as emperor and Caesar. These were important themes of the Spanish Renaissance, and of the Imperial Renaissance, in which Spain embraced the ideologies and aesthetics of the Roman Empire, and the disciplines of poetry and history from the *studia humanitatis* were used in service to empire (Dandeleit 2014).

Acuña took on a different type of commission in 1551, from the emperor himself. This was to translate a Burgundian French chivalric romance for a Castilian audience (Tyler 1956, 29). To help him, Charles provided him with a version he had

already translated himself as a young man (Blockmans 2002, 16). The romance was *Le Chevalier Deliberé* (1483) by Olivier de la Marche, which had roughly three sections: A knightly quest and chivalric romance, the glorification of a ducal or royal house, and an emphasis on self-examination in an *ars moriendi* treatise. It is possible to see the first two sections as part of an epic tradition – a quest and pride in one’s dukes and kings. The third is more closely linked to the lyric, as it was focused on the knight’s interior self and his contemplation of death. There were numerous proto-Reformation and pre-Reformation ideas floating around in the Low Countries which connect with this interior piety of the pilgrim knight in *Le Chevalier*. In fact, Erasmus’s *Enchiridion* would follow some of the same themes, but provide guidance for the Christian layman in spiritual rather than physical warfare, like “Memory” does for the knight at the end of *Le Chevalier*. Suzie Sutch and Ann Lake Prescott have shown that this Burgundian romance took on very different shape in Spanish and English contexts, as Acuña’s *El Caballero Determinado* and Elizabethan Stephen Bateman’s *The Travayled Pylgrime*, published 1569, and Elizabethan Lewes Lewkenor’s *The Resolved Gentleman*, published 1594. (Sutch and Prescott 1988).

Much of our understanding of Acuña’s life comes from a memorial he wrote to Philip II, asking for recognition for his many years of military service (Cortés 1913, 111–123). This sort of source was typical of minor nobles in early modern Spain who were striving for a *merced* from the crown. Court life in the early modern period was full of competition. According to Leah Middlebrook, Hernando de Acuña and Jerónimo de Urrea competed with one another for the best translation of *Le Chevalier Deliberé* (Middlebrook 2009). As a further act of social striving, towards the end of his life, Acuña applied to enter the military order of Alcántara (Acuña y Zuñiga 1562).

Interestingly, the work that Acuña published during his own lifetime was not his poetry – it was his translation, *El Caballero Determinado* (1553). It was after his death that another edition of *El*

Caballero was made (1590), and that his wife published the *Varias Poesías* (1591) (Díaz, 1980, 219–220).

Impact and Legacy

As a caballero and a “poet-soldier”, Acuña manifested the dual interest in both Renaissance and chivalric culture which was common among the Spanish elite (Terry 2015, 89). As a writer of sonnets as well as a translator of chivalric romance, Acuña produced and exemplified both the admiration for classical Antiquity as well as the values of a traditional late medieval and early modern warrior elite, weaned on chivalric romance.

Interpreting Acuña and his social and cultural context, several questions are raised regarding modernity – whether the interiority of his lyric poetry is tied to modernity, or if the glorification of world empires is more linked to modernity is a matter of debate. According to scholar of literature Christopher Maurer, epic poet Juan Latino greatly influenced Hernando de Acuña’s most famous poem where he glorified Charles V as Caesar (Maurer 1993, 35–51). Latino’s epic Latin poem, *Austrias Carmen*, celebrated the victory of Spain and the Holy League at the Battle of Lepanto in 1571. In the poems of these two members of the Granada Venegas family’s literary *tertulia* in Granada, both the epic and lyric poetic genres served the Renaissance of Empire (Dandeleit 2014; Terry 2015).

Interconnections

Hernando de Acuña was a translator from French to Castilian, a soldier-poet, and *caballero* in the Order of Alcántara. At the literary *tertulia* of the Granada Venegas family he not only met epic poet and Latinist Juan Latino and other poets, but he also may have met the famous Jesuit philosopher, Francisco Suárez, who was a generation younger than Acuña. Suárez’s family owned a house with an adjoining wall to the Granada Venegas’s urban

palace, the Casa de los Tiros, and the philosopher was born there in 1548 (López Guzmán 2005, 70–71).

Agricola, Rudolph

Born: ca. 28 August 1443

Died: 27/28 October 1485

Marc van der Poel

Department of Classics, Radboud University,
Nijmegen, The Netherlands

Abstract

The Frisian dialectician and rhetorician Rudolph Agricola was an important propagator of humanism in the Low Countries and Germany. He left a small but impressive oeuvre including letters, orations, poems, and writings on dialectic and rhetoric. His *De formando studio* is an important contribution to humanist pedagogy and didactics. His main work *De inventione dialectica* is arguably the most important Renaissance theory of discourse.

Alternate Names

[Agriocola, Rodolphus \(Frisius\)](#); [Agricola, Rudolf](#); [Huisman, Roelof](#); [Huesman, Roelof](#); [Huisman, Roelof](#)

Biography

Rudolph Agricola was born as an illegitimate child in Baflo, a small town near the city of Groningen, The Netherlands. We are informed about his life by archival documents, Agricola's surviving letters, and six contemporary biographies, among which the one by Johann von Plieningen is especially important, because he had known Agricola for many years. The sources are not unanimous about the precise date of Agricola's birth, but Akkerman's careful evaluation of the relevant data leads to the conclusion that he was born on 27 or 28 August 1443 and not, as von Plieningen states in his biography, on 17 February 1444 (Akkerman 2012, 10–12). He died on 27 or

28 October 1485. His father, Hendrik Vries, administered property of the bishop of Münster in the parishes belonging to the personate of Baflo from 1440 to 1443; from 1444 until his death in 1480 he was abbot of the Benedictine convent at Selwerd. His mother, Zycka Huisman, who also died in 1480, had three children with a second partner; Agricola's half-brother Johannes became one of his close friends. Agricola probably went to the city school of Groningen that was connected with St. Martin's church. A benefice for life granted to him by the bishop of Münster in 1454 allowed him to pursue university studies. He matriculated at the University of Erfurt in 1456, probably received his baccalaureate the year after, and continued his studies, maybe first in Cologne, but certainly in Leuven, where he became *magister artium* in 1465. From 1468 until 1479 he stayed in Italy, first in Pavia (1468–1475), then in Ferrara (1475–1479). Agricola left Ferrara in the first part of 1479 and traveled to Groningen via Dillingen on the Danube, where he stayed at the residence of the bishop of Augsburg, next Speyer, where he visited Johann von Dalberg and saw his library, Cologne and 's Heerenberg. From 's Heerenberg, he went to Emmerich, where he taught Erasmus' teacher Alexander Hegius "pure Latin and Greek," as Goswinus van Halen puts it in his biography. He arrived in Groningen at the end of 1479 or early 1480, where he became a *secretarius*, i.e., a high official and legal counselor of the city government. In this position, he took frequent business trips to various cities in the Low Countries. Agricola was not happy with the busy life that came with this position, wanted to leave, but could not choose between the various employment offers he received from different parts of the Low Countries, Germany, and Italy. He eventually decided to accept the offer from Johann von Dalberg, bishop of Worms and chancellor of Philip, the Elector Palatine, to take up residence at his court in Heidelberg. He left Groningen at the beginning of April 1484, and arrived in Heidelberg on May 2. Although he found it difficult to adapt to his new circumstances, he could now devote himself almost entirely to his studies. In the summer of 1485, he joined von Dalberg on a business trip to Rome. On the way home, Agricola

became ill, stopped in Trento to recover, but became ill again after his return in Heidelberg and died there on October 27 or 28. For a full biographical account based on the available sources see Van der Velden 1911.

Works

The surviving works of Agricola comprise 8 orations (three delivered in Pavia, two in Ferrara, one in Worms (Spitz and Benjamin 1963, Van der Laan 2003), one in Heidelberg (Mack 2000), and one in Rome (Van der Laan 2009)), 28 poems, 55 letters, 7 translations of Greek texts, and a number of texts on dialectic and rhetoric. Among these we find a brief commentary on the prologue and the excerpts of Seneca the Elder's *Controversiae*, book 1, 1–3, two texts on universals, a dialectical analysis of Cicero's oration *De lege Manilia*, but most importantly the treatise *De inventione dialectica libri tres* (henceforth DID). He also made his own copies of several classical texts, wrote notes on the first book of Boethius' *De consolazione philosophiae* and we know that he annotated his copy of the Treviso 1478 edition of Seneca's works. For full details on dates of composition and publication of his works, see Akkerman and Vanderjagt (1988, 313–327).

Agricola in the World of Humanism

Agricola followed the standard late-medieval arts curriculum at the universities of Erfurt and Leuven, perhaps also Cologne. According to his biographer Geldenhouwer, he excelled in Leuven as a student of dialectic and as a debater in academic *disputationes*, but also came in contact with people who had begun to study classical Latin. He read Cicero and Quintilian and occasionally criticized the standard Aristotelian teaching program in the presence of his teachers. Geldenhouwer also mentions that he was admired in Leuven because he learned French quickly and without a teacher, and because he sang, played music, and painted very well. Agricola had a flair for languages;

besides his mother tongue and the sacred languages, he knew French, Low German and Upper German, and both the colloquial and the literary language of Italy.

Agricola went to Pavia to study civil law, but he also followed his interests in humanism. He wrote several Latin poems, started to learn Greek, and delivered at least three times the yearly speech in praise of the rector of the university (1471 in praise of Mathias Richilus, 1473 in praise of Paulus de Baenst, 1474 in praise of Johann von Dalberg; Walter 2004). After his move to Ferrara, he continued his activities as a humanist. He studied Greek, probably under the guidance of Battista Guarino, translated into Latin the pseudo-Platonic dialogue *Axiochos*, the pseudo-Isocratean hortatory address for Demonicus, Aphthonius' *Progymnasmata*, and perhaps also Isocrates' hortatory address to Nicocles, copied works by Tacitus and Pliny the Younger, and began writing DID. Agricola had a prominent position as *familiaris* at the court of Duke Ercole I, and he regularly played the organ on Sundays and holidays. In 1476, he wrote and delivered the official address at the opening of the academic year in 1476 in the presence of Duke Ercole (Rupprich 1935, Van der Poel 1997a, 46–67). Agricola also wrote a biography of Petrarch, in which he acclaims Petrarch as the initiator of humanism and presents him as the embodiment of its characteristics and ideals (Bertalot 1929).

After his departure from Italy in 1479, Agricola maintained a network of relations through his correspondence and his business trips as *secretarius* of the city of Groningen. In 1483, the first collection of Agricola's writings appeared in Leuven, printed by Jan van Westfalen. The writings included in this volume (two of his translations, 12 poems, and two letters) bear testimony to his perfection as a humanist. In 1484, he wrote a pedagogical treatise in the form of a letter to his friend Jacob Barbireau (Jacobus Barbirianus), which is the first methodical exposition about the principles of humanist education north of the Alps (letter 38 in Van der Laan and Akkerman 2002). During his stay in Heidelberg, Agricola attended disputations and taught Latin literature at the university, and he learned Hebrew

from a teacher hired for him by bishop von Dalberg.

After his death, Agricola's fame as a humanist was further established by the circulation of manuscripts of his works and by oral tradition. Editions of his works were printed from 1492 (an edition of the poem *Anna mater*) onwards in various places in the Low Countries (Zwolle, Deventer, Antwerp). Agricola's fame was firmly established when the first editions of DID appeared, the *editio princeps* in Leuven, 1515, followed by Phrissemius' edition in Cologne, 1520 and 1523 (with commentary; Agricola 1523). By 1539, the year when Alardus of Amsterdam published the two volumes containing his well-known edition of DID with commentary and ancillary texts (Agricola 1539a), and the *Lucubrationes*, a collection of most of Agricola's other writings (Agricola 1539b), ca. 110 editions containing works by Agricola (including epitomes of DID) had already been printed.

The correspondence and the biographies show that Agricola was seen by his contemporaries and by later generations as a preeminent humanist. For a long time modern scholars have stated that Erasmus downgraded his debt to Agricola in a passage in the *Spongia* (1523), but Fokke Akkerman (2012, 183–240) has shown that the passage in question has been misread and that in fact Erasmus had great esteem for Agricola and consistently honored him throughout his career. Goswinus van Halen records that he had heard Erasmus admit that Agricola greatly surpassed him in eloquence as well as in all kinds of learning.

The *Oratio in Laudem Philosophiae, De Formando Studio*, the Translation of Aphonius' *Progymnasmata*

The importance of Agricola in the history of Western philosophy rests on his contribution to humanist pedagogy in the countries north of the Alps and on DID, his new Dialectic, in which he combined traditional dialectic with rhetoric to build a single art of methodical thinking and probable reasoning

applicable to all subjects in the humanities and the sciences. In the inaugural address delivered in Ferrara in 1476, which was published in 1511 (and reprinted several times) under the title *In laudem philosophiae et reliquarum artium*, Agricola presents a classical discussion of philosophy as the love of wisdom, i.e., the desire to learn to know things human and divine, joined with the pursuit of virtue. Agricola follows the ancient division of philosophy (e.g., Cic. *De or.* 1.68; Aug., *Civ.*, 21.25) into logic (subdivided by Agricola in the three arts of the trivium), physics (subdivided by Agricola in medicine, mathematics or the four arts of the quadrivium, and theology), and ethics. In his discussion of these subjects, Agricola emphasizes the need for virtue. For example, he stresses that any eloquence tainted by impure motives is not admitted in the domain of philosophy and he presents ethics not as the academic study of general moral questions but as the protreptic art that encourages people to control their desires and passions.

In the letter to Barbirianus, frequently printed between 1511 and 1532 under the title *De formando studio*, he presents a standard survey of the subjects taught in humanist schools, with a conspicuous emphasis on Christian education and on didactics. The study of moral philosophers and historians, poets and orators serves as a preparation for the study of the Bible. Agricola's discussion of the standard method of Latin language training, consisting of reading and translation and composition exercises, is followed by a brief exposition of a method of original writing. This method consists of assiduous reading in order to fully understand what one is learning, of memorizing the knowledge one has acquired, and of continual writing practice in view of developing one's own ideas. The skill of writing original texts is described by Agricola in two steps. The first step is to have one's knowledge readily available by classifying everything one has read under easily memorizable headings or *loci communes* such as virtue and vice, life and death, learning and ignorance, friendliness and hatred. The second step is to study the material collected under the headings and to develop one's knowledge about this material by means of dialectical topics, for

which Agricola refers Barbirianus to DID. The method of *loci communes*, in combination with topical description such as presented in DID, constitutes the starting point and the core of the humanist practice of the commonplace-book, which was universally applied in schools. Philipp Melanchthon developed it further as a method for the study of philosophy and the higher disciplines (Moss 1996, 119–133).

Agricola's third contribution to humanist pedagogy is his translation of Aphthonius' *Progymnasmata*. This ancient textbook, containing composition exercises preparing students for the composition of orations, was commonly used in Renaissance schools, and Agricola's translation was printed dozens of times between 1532 and 1689.

De Inventione Dialectica

General Characteristics

Agricola finished the draft of DID in the summer of 1479, during his stay in Dillingen on the Danube. It is clear from the available sources that Agricola did not himself make a clean copy of the final version of the work. The three editions produced in the Renaissance (Louvain 1515, by Alardus, Geldenhouwer, and Dorp; Cologne 1520 and 1523, by Phrissemius; Cologne 1539, by Alardus) are based on various, now lost manuscripts and show a variety of differences in both the layout and titles of the chapters and the text itself. Two manuscripts are still extant, one issuing from the circle of the brothers von Plieningen (*S*), one whose provenance is unknown (*U*). The chapter division varies in the manuscripts and the three editions. In modern scholarship, the chapter division of *S* and Alardus' edition is usually followed, but it is not certain that it stems from Agricola himself.

Goswinus van Halen relates in his biography that Agricola, referring to his studies for the degree of magister artium, had said that he regretted "nothing so much as that I wasted seven whole years on those trivialities at an immense loss of money and time taken out of my life" (Akkerman

2012, 84–85). This anecdote may be true or false, but it is a fact that *De inventione dialectica* stands very firmly in the tradition of scholastic dialectic and, unlike Lorenzo Valla, Agricola never fundamentally criticizes or rejects the scholastic philosophers, though it is clear that he found their work too profound and, as he says when he discusses Duns Scotus' opinion concerning the topic "related things" (1.26), "neque nostrae farraginis" ("not my bag", Agricola 1539a, 155, Mundt 1992, 168). Agricola wrote some undated notes on the scholastic concept of universals, published by Alardus as an appendix to the chapter on *genus* and *species* (1.6), and his response to an anonymous critique of these notes has survived in manuscript (Nauta 2012); both texts seem to indicate that Agricola intended to align himself with the realists in the debate on universals. In light of Agricola's reserve about scholastic philosophy, one may wonder whether he did plan to write an entire book on universals (for which the surviving notes were a preliminary study, as Alardus thought), or whether his view on universals fundamentally shaped his ideas on the topics, as has been suggested in recent scholarship. In any event it is clear that Agricola's focus in DID was on the use of topics as a practical instrument for reasoning. His criticism of contemporary dialectic, as presented in 2.1, concerns the theory of consequences (although he does not mention this theory directly), which uses topics to judge the correctness of arguments rather than to find them, and more generally the practice of arguing in disputations following strict rules, as a result of which, according to Agricola, theologians were unable to teach ordinary people and stimulate them to the observance of the Christian virtue. In this chapter, Agricola states it as his purpose to be the first since Quintilian to explain the use of topics as places to find arguments. In his survey of theorists who have written on topics (1.3) he mentions classical authors only, and apart from brief mentions of Duns Scotus (in 1.26 and 2.23) and Raimundus Lullus (in 2.1), he never refers to or discusses any medieval or humanist writers on his subject.

Agricola's Dialectic concerns all things about which uncertainty exists and therefore are subject

of debate for and against on the basis of probable arguments. This concerns both scientific research in the scholarly disciplines and all forms of discourse on practical subjects, i.e., discourses in the three branches of classical rhetoric, and sacred rhetoric, which, in Agricola's words, must teach justice, devotion, and piety, and exhort to the virtue. Topics and topical invention offer the appropriate method of critical thinking and arguing persuasively in all these fields. The indissoluble cohesion between the three arts of the trivium is a fundamental premise of DID. Agricola's starting-point are the functions of speech as they were defined in classical rhetoric as the tasks of the orator: *docere*, *movere*, *delectare* (teach, move, please). In the prologue, he states that *docere* is the fundamental function of speech, while the other two follow it depending on the context. This is treated in more detail in 2.3: the purpose of teaching is either to explain something or to create belief in what one says and to carry away the listener. In the first case, one needs only to speak grammatically correct language and use techniques for clarity, e.g., certain figures (e.g., repetition). In the second case, however, one needs to find probable arguments and place them in the proper order so as to make them suitable for the purpose of teaching, and this is domain of dialectic. In the conclusion of 2.3, Agricola stresses that disposition (or judgment) is an integral part of invention, because to not find anything and to find things that do not convince amounts to the same thing. Many aspects of the correct disposition of arguments for the purpose of creating conviction are discussed in the section on the instrument of dialectic, which consists of a systematic and detailed discussion of all forms of discourse (*oratio*) (2.15–2.19); in addition, general rules of disposition are discussed separately in 3.8–14. This subject was clearly important to Agricola, because in a letter to his friend Adolf Occo, written when his draft of books 2 and 3 was being copied by Dietrich von Pleningen, he mentions that he had written more on disposition than any of his predecessors (letter 18 in Van der Laan and Akkerman 2002). *Movere* is another important subject in DID. In 2.4, using Dido's plea to

Aeneas in Vergil's fourth book of the Aeneid and Cicero's emotional defense of Milo as examples, Agricola shows how emotion can be a necessary part of argumentation, and therefore that moving is not different from teaching as far as invention goes. As to *delectare*, he argues in 2.5 that it is different from teaching and moving, because it resides solely in the mind of the person who listens. It cannot, therefore, be a final goal of one's speech and it does not belong to invention. Inasmuch as things are said for the sake of delight and to please the ears, they are not the goal of what is said but of the person who says it.

DID is focused on the practice of reasoning. This focus explains to a large extent Agricola's adaptations in the traditional definitions of dialectic and rhetoric, and in the sequence and description of the topics. It also inspired his discussion of the material and instrument of dialectic. Moreover, although Agricola criticizes many of his ancient predecessors explicitly, e.g., Aristotle because his *Topics* is not a practical guide to *inventio* (1.3), Cicero's and Boethius's discussion of *antecedentia*, *consequentia*, and *adiuncta* (1.20; see also 1.28), Boethius' treatment of the *maximae* (1.29), he is not dogmatic and does not propose his discussion of the topics as one that is fundamentally better than those of his predecessors, but merely as one that is less sophisticated and more detailed (1.3). The practical focus of DID is also well illustrated by a passage in the discussion of the topic "subject" (1.13), where Agricola says that it is not a problem if one draws an argument from a topic which on close inspection does not contain it, because in the practice of the arts it does not matter how exactly one distinguishes the rules, but how adequately one uses them.

It is clear from the layout and the style of DID that the work was written, as Agricola formulates it in 1.3, for people acquainted with the classical authors, but unfamiliar with the theory of dialectic and rhetoric. He writes humanistic Latin following the usage of ancient authors from all periods, but without the rigidity of purists (e.g., in 2.8, he defends, probably against Valla, the unclassical "quidditas" by analogy with the classical

“Lentulitas,” “Appietas”). He uses examples from everyday life to explain difficult concepts, e.g., in 1.13, the propositions “water is cold” or “I have slaughtered a cow” to explain the philosophical meaning of subject as one of the ten categories, or, in 1.16, the triplet “a building,” “the man for whom it is built” and “the architect and craftsmen who build it,” to explain the differences between the topics efficient and final causes, effects, and intentions. Examples taken from classical literature and history are found everywhere, and Agricola shows the use of persuasive techniques by analyzing passages from poets and orators (e.g., in 2.17, the analysis of the story of the Greek spy Sinon in Vergil’s account of the ruse of the wooden horse, to show that Sinon had nothing to create belief in what he told the Trojans, but nevertheless managed to convince them). Agricola also makes frequent use of comparisons and examples. Some of these are taken from things he was interested in or had experience with. Thus, he says at the beginning of his chapter on the use of dialectic (1.3) that, in order to explain this difficult subject for novices, he wishes he could not only speak about it but also paint or sculpt it out. In 2.23, where he explains that one should adjust an exposition to that about which it must supply conviction, he first presents a detailed analysis of how the ancient comedian Terence’s character Simo succeeds in presenting his son Pamphilus in a good light even though he is the friend of a girl of ill repute, and then compares this clever misguiding of the audience with the technique of chiaroscuro in painting, which creates the impression that images are clearly visible even when they are covered in shadow. Similarly, in the concluding chapter of the book (3.16), he refers to the arts of painting and music to explain the all-important need to combine knowledge with assiduous practice in order to achieve mastery of reasoning.

Structure and Content

The organization of DID is exemplary with brief introductions at the beginning of each new section or subsection and summations at appropriate intervals to help the reader in following the sometimes complex argumentation and to constantly remind

him of the overall structure of the entire work. Book 1 is entirely devoted to the topics. Chapters 1–3 provide a general introduction to the topics, their origin, utility, and function, and a critical survey of the treatment of topics by Aristotle, Cicero, Quintilian, Boethius, and Themistius. In Chap. 4, Agricola explains the logical sequence of his topics, which differs from that of his predecessors. The topics are discussed successively one by one in Chaps. 5–27, as follows: two groups of internal topics: within the substance of the thing (1. definition, 2. genus, 3. species, 4. property and difference, 5. whole, 6. parts, 7. things related by etymology), around the substance (8. qualities, 9. actions, 10. subject); four groups of external topics, two necessarily joined with the thing: related things (11. efficient cause, 12. final cause, 13. effects, 14. intentions) and attached things (15. place, 16. time, 17. connected things), and two joined to the thing without necessity: accidents (18. contingents, 19. name of a thing, 20. pronouncements, 21. comparisons, 22. similars and dissimilars) and repugnants (23. opposite things, 24. different things). A special chapter is devoted to differences between Agricola’s topics and those of his predecessors. In the final chapter Agricola provides a survey of his topics and a brief discussion of the reasons why he has omitted the maxims which Boethius had added to each topic.

Book 2 is devoted to the skill of reasoning, which consists according to Agricola of three things: material, instrument, and usage of the topics. It begins with an introductory section in which are discussed successively the faults of the contemporary use of dialectic, the definition and goal of dialectic, and the fact that moving follows the same rules of invention as teaching, whereas pleasing is separate from both because it resides in the mind of the listener and therefore cannot be a final goal of what one says. The section material (*materia*) contains a detailed discussion of the *quaestio*, the various ways to classify *quaestiones*, how to determine the essential point of a *quaestio*, and the division of a *quaestio* in subsidiary *quaestiones*. The *instrumentum* of dialectic is defined as discourse in the broadest sense of the word, including all prose genres, epic, and drama. It discusses two divisions of discourse, one based

on structure (continuous, e.g., a speech; discontinuous, e.g., a dialogue), the other on result (*expositio*, used when one teaches an audience willing to follow; *argumentatio*, when one teaches an audience that needs to be forced to assent by force of arguments), next the nature of the various forms of argumentation (syllogism, induction, enthymeme, example) and the ways to construct and refute them, the various kinds of exposition based on their purpose (pure exposition and exposition within an argumentation), and the parts of a discourse. At the beginning of the final section, on usage of the topics, Agricola stresses that there exist no topics for rhetoric alone. He continues by discussing the treatment of topics in two steps, first topical analysis of texts, second topical description of abstract and spatiotemporal entities (“philosopher,” “Socrates,” “spouse”) and collection of arguments for and against concerning questions about these (“should a philosopher marry?”). The complicated process of topical analysis, including condensation of complex and stylistically elaborated arguments to their basic form, is illustrated with many examples from classical orators and poets. Agricola also wrote a separate topical analysis of Cicero’s speech *De lege Manilia*, which was published as an appendix to DID in Alardus’ edition (Van der Poel 1997b). The section concludes with an example of topical description of “philosopher” and “spouse,” including a collection of possible arguments concerning the question “should a philosopher marry?” based on the two topical descriptions. Book 2 ends with a synopsis of the entire process of topical invention.

Book 3 discusses three items: the nature of emotions and the ways to manage them in a discourse, discussion of the things which make the discourse pleasing to the audience, including mainly a discussion of abundance and brevity, and a study of disposition in two parts, i.e., disposition in exposition (historians, poets, scholarly prose) and disposition in oratorical prose (the parts of an oration, disposition of the various questions, disposition of the argumentations in each question, variation in the elaboration of separate arguments). The final chapter discusses the importance of practice and exercise.

Impact and Legacy

The above synopsis shows that DID, although written for novices, is not only a comprehensive but also a complex study of humanist dialectic and rhetoric. Its content was made more accessible as a tool for teaching by the commentaries of Phrissemius and Alardus, and even more by the epitomes of the work by Bartholomaeus Latomus (1532), Ioannes Visorius (1534), and Alardus (1538, book 1 only). Brief summaries by chapter, with explanatory notes, were made by Caspar Rodolphus (1538). Between 1515 and 1575, around 75 editions of the text and epitomes were printed. The commentators and epitomists were themselves teachers and their writings and textbooks assured the dissemination of Agricola’s approach to dialectic and the method of analyzing and producing texts. The production of scores of textbooks exemplifying the dialectical analysis of classical texts, methods of topical invention and commonplace books in the sixteenth century illustrates that Agricola gave decisive direction to the teaching methods in the sixteenth century, especially in the countries north of the Alps, even if his name is not always mentioned. The Venice 1567 translation of Alardus’ text of DID by Orazio Toscanella, containing diagrams summarizing the contents of each chapter, is a rare testimony of interest in Agricola in sixteenth-century Italy. The importance of Agricola is also demonstrated by his influence on the ideas about dialectic and rhetoric of two of the most productive and authoritative teachers and university men in the sixteenth century, Philipp Melanchthon (who is also one of Agricola’s biographers) and Petrus Ramus. The pedagogy of the humanists, including the methods of reading, analyzing, and composing texts propagated by Agricola, remained in effect in European schools until long after humanism had ceased to be a viable intellectual force. Christian Kästner’s *Topik oder Erfindungswissenschaft* (1816) is probably the last substantial trace of Agricola’s influence in the humanities (DID is mentioned on p. 9). In their seminal work in the field of New rhetorics from 1958, Chaïm Perelman and Lucie Olbrechts-Tyteca refer twice to Agricola, among many other earlier theorists from Aristotle onwards, though

not, as one might expect, in their discussion of the topics, but in their discussion of the disposition of arguments (Perelman and Olbrechts-Tyteca 1958, vol. 2, 666, 669).

In recent decades, scholarly interest in Agricola was stimulated considerably by the international conference on Agricola organized by Fokke Akkerman and Arjo Vanderjagt in 1985 at the University of Groningen. The proceedings of that conference (Akkerman and Vanderjagt 1988) contain a full bibliography of earlier scholarly work on Agricola.

Abstract

Agrippa was the main expounder of the occult philosophy, which is the knowledge of the hidden causes of things and is finalized to their manipulation by magic. Magic, in turn, is the highest form and the end of philosophy. According to his *De occulta philosophia*, magic is threefold: natural (concerning sublunar world), celestial (concerning stars and heavenly intelligences), and divine (concerning God and higher angels). It consists of the manipulation of concrete objects and of the summoning of intelligences and God, which is performed on the basis of the precepts of the Kabbalah. Agrippa's overall aim was to purify magic from its necromantic and irrational components: this would enable the restoration of the prelapsarian condition of man (in accordance with the Hermetic ideal of deification) and a Christian reform of culture. The critique of philosophical knowledge and of every science, presented in Agrippa's *De vanitate*, and his critique to the subordination of woman typical of Scholastic theology, contained in the *De nobilitate foeminei sexus*, are functional to these ends.

Biography

Cornelius Agrippa was born in 1486 near Cologne, where he studied from 1499 and became *magister artium* in 1502. After his graduation, he joined the imperial army and traveled to Spain (1508) and to France, where he started his academic activities in Dôle, teaching Johannes Reuchlin's *De verbo mirifico*, and wrote his *De nobilitate et praecellentia foeminae sexus*. In the same years, he completed the first version of his *De occulta philosophia* (Agrippa 1992). In 1509 or 1510, he left Dôle after having been accused of "Judaizing heresy," as Reuchlin's *De verbo mirifico* relies on a Cabalistic exegesis of the Jewish Bible and on Jewish scholarship to argue for the nature of Jesus as Messiah (Zika 1976; Lehrich 2003, 26; Perrone Compagni 2005, 16; Nauert 2011). Afterward, he traveled in Germany, the Netherlands, and England, serving Maximilian I as diplomat, and from 1511 in Italy. At the University of Pavia, Agrippa taught Plato's *Symposium* and the *Pimander* (part of the *Corpus Hermeticum*), and in Turin he taught theology. In 1518, he moved again to France and became public *advocatus* in Metz, where he clashed with the local inquisitor while defending a woman accused of witchcraft and entered in a dispute with the Dominicans, as he denied a legend on the marriages of St. Anne (Agrippa 1534). He thus left Metz and practiced medicine in Geneva, Fribourg (1521–1523), and at the French court in Lyon from 1524 on, where he held the position of physician of Louise, the mother of the King. In Lyon, Agrippa suffered financial and personal problems as he could not obtain support from his patroness Marguerite of Alençon. Eventually, he left the French court and became, in 1528, imperial historiographer in Antwerp, but he lost this position after having published his *De vanitate* (1530), containing an attack to the mendicant orders which led the governor of the Netherlands, Margaret of Austria, to report it to the theological faculty of Louvain. Finally, in 1532 he came into service of the Archbishop of Bonn but was again attacked by the Dominicans, as he was about to publish the full version of his *De occulta philosophia* that they considered heretical. This edition was intended to provide a complete

presentation and defense of his work, as only a manuscript version (1510) was circulating. Eventually, this edition appeared in 1533. In 1534–1535, he moved again to France and died in 1535 in Grenoble (Van der Poel 1997, 15–49; Lehrich 2003, 25–42; Blum and Müller-Jahncke 2010; Nauert 2011).

Heritage and Rupture with the Tradition

Agrippa was the main expounder of occult philosophy, i.e., the knowledge of the hidden properties of things that makes possible their manipulation by the techniques of magic, which is the highest form and the end of philosophy. His overall aim was to purify magic from its necromantic and irrational aspects, which would enable the deification of man and the restoration of the prelapsarian unity with God (Perrone Compagni 2000). Being interested in occult philosophy since he had read Albertus Magnus's *Speculum astronomiae*, containing a defense of the influence of stars on bodies (Zambelli 1992b), in his *De occulta philosophia*, Agrippa divides magic into three kinds: natural, which is the manipulation of concrete objects (Lehrich 2003, 44–97) and of the world spirit that underpins their occult properties (Nauert 2011); celestial or mathematical magic, which concerns the powers of stars and the intelligences (as lower angels) governing them, summoned by numeric formulas and images (Lehrich 2003, 97–113); and divine or ceremonial magic, which consists of theurgical rites – such as the use of the name of higher angels and God – based on the contents of the Kabbalah, which Agrippa knew in the Christianized version of Giovanni Pico, Reuchlin, and Francesco Giorgio Veneto (Perrone Compagni 1982). In his *De vanitate*, on the other hand, Agrippa distinguishes between natural magic – which is natural philosophy itself – and ritual magic, which has a demonic character (Zambelli 1992a, 2007, 13–34). The apparent contradiction with his *De occulta philosophia* can be explained in the light of his program of a Christian reform of culture (influenced by Erasmus, Zambelli 1970; Van der Poel 1997), to which his purging of magic was functional. In his *De vanitate*, he uses skeptical

arguments to criticize all sciences, only in order to show that these are less reliable than faith in guiding man to the knowledge of God (Van der Poel 1997, 112–115) and to establish a *prisca theologia* where faith and reason are perfectly balanced and the original harmony with God is restored (Perrone Compagni 1997, 2000, 2009). Such ideal of harmony and deification was inspired by Platonism and Hermetic philosophy, underlying also his *De homine* and *De triplici ratione cognoscendi Deum* (Agrippa 1958, 2005; Perrone Compagni 2005). Agrippa's criticisms are moreover directed against scholastic philosophy and theology, which are the main targets of his *De nobilitate foeminei sexus*, where the canonical interpretation of Eve's sin is disregarded as authoritarian and equality of sexes is devised as part of the reappropriation of the prelapsarian condition (Agrippa 1529, 1990, 1996; Perrone Compagni 2006).

Akindynos, Gregorios

Born: ca. 1300, Prilapos, Northern Macedonia

Died: ca. 1348, Macedonia

George Zografidis

Department of Philosophy, School of Philosophy and Education, Aristotle University of Thessaloniki, Thessaloniki, Greece

Abstract

Gregorios Akindynos was a Byzantine theologian of the fourteenth century (ca. 1300–1348), learned in patristic literature and Greek philosophy, and leader of the anti-Palamite party in the second phase of Hesychast Controversy (1341–1347). Based on his interpretation of the Greek patristic tradition, he wrote extensive refutations of Gregorios Palamas' works and especially of the Hesychast theological justification of the essence-energies distinction within God. For Akindynos simplicity is a major attribute of the tripartite God, and everything separated from God's essence is created;

so there can be no distinction between incomprehensible uncreated divine essence and comprehensible and inferior uncreated divine energies. Any such theory subverts the unity of the Trinity and leads to ditheism, for which he accused Palamas. Divine names do not correspond to energies but just denote divine nature. Regarding man's participation in God as a means for deification, Akindynos refuses Hesychast's claim that man is capable of participating in divine energies and even seeing them in a spiritual manner. The divine light which humans experience is a symbol and, together with the created world and reason, a way to the knowledge of God. Given this kind of knowledge, it is only in divine love that the inexplicable union of man and God occurs and deification is possible. Akindynos influenced anti-Palamite writers, and his works have been severely criticized by Hesychast theologians.

Biography

Gregorios (his baptismal name is unknown) was born in Prilapos, Northern Macedonia, at ca. 1300. He studied in Thessaloniki under the humanist Thomas Magistros and the monk Bryennios, and he was trained in theology and secular learning. Between 1326 and 1330 he met Gregorios Palamas who appreciated his talents and guided him to monastic spirituality though finally he was not accepted in Mount Athos. He returned to Thessaloniki (1332), where he met Barlaam of Calabria, and before 1334 he dwelled in Constantinople.

When the Hesychast Controversy started, Akindynos, being a friend of both Palamas and Barlaam (the leaders of the rival sides), tried to reconcile them and to bring peace to the Orthodox Church. Putting aside his theological disagreement with Palamas, Akindynos attempted to persuade Barlaam not to insult the psychosomatic technique of monks and defended Palamas from Barlaam's accusations for heresy. But when an ecclesiastical Council (1341) condemned Barlaam and accepted the essence-energies distinction in God, he entered the anti-Hesychast party.

At the second phase of the Controversy, after Barlaam departed for Italy (1341), theology was mixed with politics: Akindynos became himself the leader of the anti-Palamite party, and during the Civil War (1341–1347), he took the part of Emperor John V Palaiologos against John VI Kantakouzenos, the co-emperor and theologian who had supported Palamas. He cooperated with Patriarch John Kalekas and started to gain ecclesiastical power; he charged Palamas for ditheism and a Council (1344) condemned his once friend. When John VI got back to power (1347), Akindynos lost the Court's favor and left the capital, while a new Council restored Palamas. He died soon after (1348) and he was officially condemned together with Barlaam (1351).

Doctrine

Akindynos had a fair knowledge of Greek philosophy and of the patristic literature as it can be attested in his theological works and the numerous letters written in a short period of time. He is a competent writer although sometimes his argumentative style is loose and unmethodical mostly because of its polemical tone and the intentional repetitions.

Hesychast writers created a totally negative picture of a heretic Akindynos insensitive to monastic spirituality, influenced by Greek philosophy and exponent of erroneous or even pagan beliefs. Palamas presents him as an agnosticist and some modern scholars as a rationalist who is more concerned with secular wisdom and is using its tools to comprehend theological issues and especially the triadic dogma. Akindynos' self-image is quite different: he does not claim personal originality but inscribes himself within the patristic tradition, and he constantly relies on patristic texts and recurs to their authority while accusing Palamas for dangerous theological renovations on account of textual misinterpretations.

His opus magnum is the *Antirrhetics* against what he calls Palamite heresy. He is methodically citing by paragraph Palamas' text and then comments on it. The main problem of the Controversy was not (as it was in its first phase) the dispute over the eternal procession of the Holy Spirit and

filioque but the possibility and the nature of man's participation in God as a means for deification (*theosis*).

Akindynos reduces his opponents' doctrines in two main theses: (1) the existence of uncreated energies (God's operations) that are "infinitely infinite" inferior to divine essence and (2) man's ability to participate in these energies and even to see them "in a spiritual manner through his corporeal eyes."

1. The first thesis puts in question the very nature of God in himself. For Akindynos and all those who take simplicity to be a major attribute of the tripartite God, such a distinction undermines the unity of the Trinity and lets to intrude a substantial separation and hence inferiority in God; so he accuses Palamas for ditheism and Messalianism, as if the Hesychast was influenced by the dualist heresy of Bogomils.

For Akindynos divine names do not correspond to separate uncreated energies but are mere names that humans attach to God to denote divine nature; what we call uncreated energy is divine essence because "every uncreated is essence" (*Antirr.* 5.2.5). It is the human epistemological condition that constrains man to grasp the whole at once; so when we divide the whole in smaller unities, we risk to take them as being self-existing. Thus within the divinity, as simple and as a whole, there can be no distinction between incomprehensible divine essence and comprehensible divine energy. The divinity itself is either inconceivable as a whole or entirely conceivable. Palamas' distinction introduces a hierarchical partition between essence (a higher divinity) and energies (a lower divinity), thus leading to a ditheism. In addition it implies two different ontological levels that render impossible for the energies to be uncreated (as Hesychast's claim). So every divine energy, if separated from God's essence, is created; the only uncreated energies (of the Father) are the Son and the Holy Spirit.

2. The second issue about man's participation in God has serious impact on anthropological and ethical matters. If we suppose that man acquires the uncreated grace and thus

participates in the divine essence, then man is uncreated and coeternal with the Creator, something absurd. It is only in divine love that the union of man with God occurs – something inexplicable to human reason.

As for the experience of the divine light (the Taborian light of transfiguration), Akindynos calls it mysterious and beyond human explanation, but Palamas argues that for Akindynos it is created (*ktiston*). This light is sensible; in fact it is a symbol. And such symbols, as well as the created world and reason, are ways to the knowledge of God. This knowledge is what man should pursue and not an unattainable view of God; it is a means to deification made possible by God himself and incarnation.

Akindynos' views had influenced the anti-Palamite writers of the fourteenth century, and his works have been criticized or refuted in detail by numerous Hesychast theologians as his friend Gregorios Palamas, Matthaios Blastares, Patriarch Theophilos Kokkinos, David Disypatos, and Joseph Kalothetos.

Akrasia

► Will in Renaissance Philosophy, Weakness of

Alberti, Leon Battista

Born: Genoa, 18 February 1404

Died: Rome, 20 April 1472

Fabio Della Schiava

Department of Latin Literature, KU Leuven,
Leuven, Belgium

Abstract

Writer, mathematician, and architect, Leon Battista Alberti was one of the most versatile humanists of his generation, able to innovate literary genres and to cross disciplines. Although he was not a systematic philosopher, Alberti has explored several philosophical issues in his work, making use of a remarkable and up-to-date library. This entry will offer a brief overview of his philosophical background and of his moral and political speculation.

Biography

Born in Genoa on 18 February 1404 (Cardini 2005, p. 151), Leon Battista Alberti was the second of two illegitimate sons of Lorenzo di Benedetto Alberti and Bianca di Carlo Fieschi. His father was a Florentine merchant banished from Florence after the Tumulto dei Ciompi; his mother, a noblewoman from Genoa, probably died 2 years after Battista's birth. His older brother Carlo was also active as a poet (Martelli 2015).

Despite the precarious position of the family, Lorenzo was able to guarantee his sons an outstanding education for his time. In 1415–1418 Battista attended the grammar school of Gasparino Barzizza in Padua, where he became acquainted with some of the finest humanists of his generation, such as Antonio Beccadelli, Francesco Barbaro, and Francesco Filelfo, who probably taught him some elements of Greek. He then moved to Bologna, where he engaged in the study of Canon Law, mathematics, and physics. After obtaining his law degree in 1428, Alberti entered the court of cardinal Niccolò Albergati, with whom he might have traveled through Germany and France. In 1431 Battista was in Rome, at the service of the patriarch of Grado Biagio Molin, who secured him a post as *abbreviator apostolicus*. Due to the insurgence of the Colonna and Eugene IV's subsequent flight from Rome, Alberti moves to Florence, where the Curia found shelter. Here, he comes into contact with the *avantgarde* of Early Quattrocento Humanism, and in particular with Leonardo Bruni, Carlo Marsuppini, and Teodoro Gaza. He did not neglect the artistic milieu either; on the contrary, he established good relationships with Donatello, Brunelleschi, and Masaccio. Between 1436 and 1438, Battista follows the Curia in Bologna, Ferrara, and Firenze. His greatest achievement of these years is probably the organization of the *Certame coronario*, a poetic competition in the vernacular on the theme of the *vera amicitia* ("true friendship"), which earns Battista a central place in the Renaissance debate on the dignity of the Italian language ("Questione della Lingua"). Back in Rome in 1443, Alberti plays a major role in the urbanistic renovation project of the city promoted by Nicholas V by contributing his expertise as an architect, engineer, and anti-quarian (Grafton 2000, 225–49). Battista continues to serve in the Curia during the papacy of Pius II (1458–1464), before being dismissed from his post as an *abbreviator* by Paulus II (1464–1471). From ca. 1450 onwards, he intensifies his activity as an architect: his creations in Florence (Palazzo Rucellai, cappella Rucellai at S. Pancrazio, facade of S. Maria Novella, Rotonda dell'Annunziata), Rimini (Tempio Malatestiano),

and Mantua (S. Sebastiano, S. Andrea) show his sophisticated knowledge and personal interpretation of the classical art of building. In the late sixties Battista gets close to Lorenzo de' Medici and the circle of the Platonic Academy led by Marsilio Ficino. An echo of this attendance can be found in Cristoforo Landino's *Disputationes Camaldulenses* (1475), where Alberti is presented as an interlocutor in the dialogue along with Giuliano and Lorenzo de' Medici, Ficino, and other Florentine intellectuals.

Literary Commitment

Alberti was one of the most versatile writers of his time. Writing both in Latin and in the vernacular, he engaged in a dialogue with the classical tradition within the intertextual theoretical frame of the "mosaic", that is, his original rendering of the humanistic *imitatio*: since the ancient authors had already written everything that humankind needed to know, modern writers can only recombine the old "tiles" from the classical sources into a new picture (Cardini 1990). This does not necessarily result in a lack of originality: the quest for novelty in literature is indeed one of the *leitmotifs* of Battista's poetics (McLaughlin 2016, 146–47). In 1424 Alberti writes the comedy *Philodoxeos fabula*, which was considered an authentic work by a classical author, Lepidus, for nearly a decennium: this pseudonym will often be reused by Alberti in future works (McLaughlin 2016, 19–37). Written between 1428 and 1432 dedicated to his brother Carlo, the *Commodis litterarum atque incommotis* is a praise of the *studia humanitatis* and at the same time a critique of the society of his time, devoted only to economical profit. During his first stay in Rome, Alberti composed the hagiographical *Vita s. Potiti* (1433), and according to some scholars, the *Descriptio urbis Romae*, which is the first description of the City, based upon reliable measurements and estimates (Vagnetti 1974, 78 and others postpone the composition to the second roman period). In Florence, Alberti begun to work on the treaty *De pictura* (1435) dedicated to Brunelleschi. Written first in the vernacular and

then translated into Latin, this writing in fact deals with geometry, and was most influential in the years to come for its theoretical treatment of perspective. In 1437 Alberti publishes the *Pontifex*, on the virtues required for a bishop, and the *Apologi centum*, his contribution to the genre of the fable. But the major commitments of these years are doubtless in the vernacular: the four books *De familia*, which he worked on from 1433 to 1434 and again in 1437, and the dialogue *Theogenius*, dedicated in 1441 to Leonello d'Este. Lucian of Samosata is the model of his *Intercoenales* (1432–1443: Cardini 2010, 196–200), a collection of short dialogues on several moral themes, and *Momus* (1450), a long allegorical satire of the society of his time. Alberti also devoted himself to technical matters, such as grammar (*Grammatichetta Vaticana*, ca. 1435, which is considered the first grammar written in a romance language), rhetoric (*Trivium senatoria*, 1460, dedicated to Lorenzo il Magnifico), and cryptography (*De componendis cifris*, 1466). His most peculiar and successful work is, however, the treatise *De re aedificatoria* (1443–1452), which perfectly synthetizes Alberti's humanism, while being at the same time a critical study of classical architecture, in particular of Vitruvius' *De architectura*, and a technical work at the service of the community. With *De iciarchia* (1468), the last of his works in the vernacular, Alberti provides the prince with moral and civic counsel in order to rule properly.

Philosophical Library

The portrait of Alberti as a Neoplatonic philosopher painted by Cristoforo Landino in his *Disputationes Camaldulenses* is to be rejected as much as the other attempts to label him as a stoic, sceptic, or even eclectic thinker (Vasoli 2007, 21–24). Indeed, like most of his fellow humanists, Alberti is not a systematic philosopher but responds to the different stimuli of his philosophical library (Bertolini 2005; Regoliosi 2005). Beside the omnipresent Cicero and Seneca, his library includes texts unknown to the medieval intellectual debate as well as those revitalized by

the humanist's translations. Alberti's library is thus open to Bruni's translations of Aristotle's ethical and political writings and Plato's dialogues; Uberto Decembrio's version of Plato's *Respublica*; Xenophon's philosophical works and in particular the *Oeconomicus* and *Symposium*; Plutarch's *Lives* and *Moralia*, revived in western culture by Aurispa. On the Latin side, Alberti knows and uses Lucretius' *De rerum natura*, a recent discovery of Poggio Bracciolini and an important means of access to the epicurean philosophy (Canfora 2007a). Alberti's scientific interests are nourished not only by Pliny's *Historia naturalis* (Anselmi 2010, 122) but also by less common bibliographical items for that time, such as Celsus' *Medicina*, Columella, Euclid, ps. Hippocrates' *Letters*, Theophrastus, Manilius' *Astronomica*, ps. Pythagoras' *Aurea praecepta* and *Symbola*, Vitruvius: all decisive works to the formation of Alberti's moral philosophy, always suspended between "precise indagini scientifiche e ansia metafisica" (Garin 2007, 137). Alberti's approach to this impressive library is, however, unsystematic and often second-hand: Plato is frequently quoted from Cicero; Hesiod is derived from Seneca and in one case even from the contemporary *De re uxoria* of Francesco Barbaro (Bertolini 2005, p. 102). The frame that holds together Alberti's philosophical culture rather consists in historical and biographical accounts, and in particular Diogenes Laertius' *Vitae philosophorum*, which he could read in the recent translation by Ambrogio Traversari. Finally, it is worth to mention the persistence of medieval authors, especially in his "technical" library (Federici Vescovini 2007), and his deep knowledge of the ecclesiastical and patristic tradition (Giannarelli 2007; Piccardi 2007).

Virtue and Fortune

The dialectic between *Virtus* and *Fortuna* is the leading theme of Alberti's moral reflection as well as his peculiar angle to approach a vaster set of philosophical issues, regarding human nature, man's rapport with God, and his functioning in society. Conducted throughout all his life,

Alberti's philosophical investigations have provided a multifaceted spectrum of considerations, more often in contrast with each other than forming a harmonic system. If in his *Philodoxeos fabula* he conveys the positive portrait of a young boy able to climb the social ladder only by relying upon his virtue, in the *Commodis litterarum atque incommotis* Alberti produces a more relativistic view, in which the *virtue* of the wise philosopher bears the hallmarks of a consolation against unfair and immutable fortune. In the *Intercoenalis* "Fatum et Fortuna" Alberti presents fate as a chain of cause and effect. *Fatum* here assumes the form of "the most turbulent river imaginable" (Marsh 1987, 23; the metaphor will be borrowed by Machiavelli in *Prince*, XXV), which one can survive not only by the virtue of the individual but also through the social cooperation of people and in particular the solidarity within a single family group rather than in a larger community ("the larger the boats, the greater the danger they face": Marsh 1987, 25). Remarkable in Alberti is also the total absence of "an idea of a providential God," or at least "of a christian God" (Garin 2007, 153) in the direction of a radical determinism: following a stoic theory reported by Cicero's *De divinatione*, Alberti's *Fatum* is nothing else than a chain of cause and effect, a "cursum rerum in vita hominum," which flows undisturbed following its own *ratio* (Cardini 2010, 240). Instead of relying on Providence, Alberti chooses the "scientific" path of the astrological prediction (astrology and astronomy are, in the Renaissance, synonyms), with a clear epistemological stance (Cardini 2005; Vasoli 2007, 32).

Man and the Cosmos

This stoic and pessimistic character of his approach also emerges in his dialogue *Theogenius*, dedicated to Leonello d'Este upon the death of his father (McLaughlin 2016, 125–44). Like his model, the "laughing philosopher" Democritus in the *Letter to Damagetus* attributed to Hippocrates (Boschetto 1995), Teogenio elaborates on the misery of man, doomed to unhappiness by his own dissatisfaction

and destined to a life of disharmony with Nature on account of his desire for wealth and possession: man does not only destroy everything in his path but he is also the only creature able to kill his own kind (Garin 2007, 148; Vasoli 2007, 40). As Garin has pointed out, in these pages Alberti overturns his model, Cicero's *De natura deorum*, in which humankind is presented as the ruler over God's creation. The result is an "anti-humanist" work, opposite and specular to the famous exaltations of the *dignitas hominis* by Giannozzo Manetti and, some years later, Pico della Mirandola, which departed precisely from the very same classical model (Garin 2007, 147–49). Not even the wise philosopher can combat the madness and foolishness of the world. As with the Democritus of the *Letter to Damagetus*, philosophers are unheard prophets. People mistake their wisdom for madness, and place them in the margin of society (Knight and Brown 2003, 208–217; Vasoli 2007, 52–54). The philosopher has no other option than to attend to his own "etica personale," as Vasoli put it, which implies a substantial disillusionment as to his social relevance and impact (Vasoli 2007, 33).

Alberti's Humor

This pessimistic approach is developed in particular in the *Intercoenales* and in *Momus*. The satirical nature of the two writings and the influence of their common model, Lucian of Samosata, allow Alberti to elaborate on the same disillusion as to humankind and its moral ineptitude. As an instrument of a cognitive approach, Alberti resorts to irony and humor, which are adopted in such a modern manner that he has been considered the forerunner of modern humoristic literature (Cardini 1993). An example is provided by his approach to God. In the *Intercoenalis* "Religio" he makes a fool of a pious friend and his superstitious worship of God, in order to reiterate his "epicurean" belief in a cosmos where God does not interfere in terrestrial affairs. And when gods and humans interact, it results in a parody. Banished by Jupiter because of his disloyalty, *Momus* infiltrates in human society disguised at

first as a poet and then as a philosopher in order to unmask the immorality of the other deities and get his revenge. Once reinstated in the Olympus, *Momus* will turn down the object of his polemics, making a caricature of humankind, much to the amusement of Jupiter. Written to "make *his* readers laugh but also to make them feel they are involved in a thorough inquiry into real life" (Knight and Brown 2003, 7), *Momus* is foremost a portrait and a critique of the society of his time, imbued with a pedagogical purpose to instruct the prince: the Olympus is an allegory of the court, and the deities represent the moral attitudes of men; in this society, simulation and dissimulation are the only ways to survive and climb the social ladder (Catanorchi 2005); good and evil are relative concepts; and "la lucida consapevolezza della stolta follia" (Vasoli 2007, 45) subsists in the background, driving humans regardless of their education and social origin.

Man and the State

There is in *Momus*, however, also a social and political concern which in fact pervades Alberti's philosophical speculations. This is particularly true for *De familia* and, 30 years later, *De iciarchia*, in which the quest for a virtuous and a modest life (in the sense, of course, of the Horatian *mediocritas*) is clearly linked to civic commitment. This should not be confused, however, with the *civic humanism* proposed by the first generation of Florentine humanists. The substantial skepticism for this approach, already displayed in the *De commodis litterarum atque incommotis*, is accompanied in *De familia* by the choice of the family as a microcosm, in which the wealth of single leading groups in the end prevails against the common good. This approach is consistent with the organization of the Florentine society of that time, which "like Leibniz's universe, was divided into atomic units: the household on whose well-being society rested" (Grafton 2000, 160), and it constitutes the core of what, in a further stage of development, Guicciardini will call "il particolare." When Alberti writes *De iciarchia* in 1468, Salutati and

Bruni's model of an independent city-state governed by men of letters has definitely waned. Overturning the perspective of *Momus*, of which *De iciarchia* has been seen as the "opposto positivo" (Garin 2007, 152), Alberti proposes the idea of a "regime of virtuous 'house-princes'": an oligarchic State, held together by the *amicitia* of its citizens and ruled by a virtuous prince (Hankins 2019, 328–334).

These different and at times opposite approaches to the same issue need to be put in the context of Alberti's biographical vicissitudes, which have played a substantial role in dosing and calibrating optimism and pessimism in his work (Garin 2007, 164). But it also outlines his research methodology, which has its scientific equivalent in the optical experiments he used to conduct (Garin 2007, 175): the world appears differently according to the filter we adopt and reality needs to be altered and deconstructed in order for it to be properly analyzed. His literature is therefore a kaleidoscope that mirrors the infinite worlds (*plures mundos... variis formis*, as he writes in *Momus*) of our daily life. This requires a great capacity for adaptation (Garin 2007, 141) or, to put it otherwise, several "masks" behind which we can hide.

Impact and Legacy

The reception of Alberti's philosophical thought was immediate. His work was an influential model for the political literature of the Renaissance, starting with Machiavelli (Canfora 2007b, Anselmi 2010; Trenti 2014) and Giordano Bruno (Garin 2007, 140); *Momus*, in particular, was extremely popular both in Italy and above the Alps, feeding into the Lutheran polemic as well as being useful for catholic reformers, such as More and Erasmus (Garin 2007, 140; Geri 2011). With regard to the origin of the "capitalistic spirit" Alberti's *De familia* has been also object of investigation by Werner Sombart and Max Weber and in Italy by Antonio Gramsci, Amintore Fanfani, and Armando Saporiti (Lenoble 2012).

Albertism

Andrea Fiamma

D'Annunzio University of Chieti-Pescara, Chieti, Italy

Abstract

Albertism is a philosophical movement born in Paris in the early fifteenth century and spread, mostly in German universities, as part of the *via antiqua*. It is characterized by theoretical and methodological adherence to Albertus Magnus' philosophy, by reference to some neo-Platonic doctrines and by its axiomatic metaphysical model. In the fifteenth century, Albertism has opposed Thomism with regard to metaphysics (the distinction between being and essence and the conception of matter) and epistemology

(knowledge without phantasms and the doctrine of universals). Theological issues do not fall among the main concerns. The most prominent Albertists are Johannes de Nova Domo and Lamberto da Monte in Paris, and Heymeric de Campo in Cologne. In the fifteenth century, Albertism spreads in Germany thanks to Johannes Wenck, Johannes Hulshot of Mechele, and Wessel Gansfort. In the second half of the fifteenth century, thanks to Jacob of Gostynin, an Albertist school develops in the University of Krakow, where a *via Alberti* exists until the sixteenth century.

Definition

Albertism is a movement involving late-medieval Aristotelianism which, unlike other contemporary philosophical schools, consider Albertus Magnus as the most reliable interpreter of Aristotle (Hoenen 2011). The foundation of Albertism is ascribed to Johannes de Nova Domo, a master at the University of Paris who in 1410 wrote a treatise entitled *De ente et essentia* (Meersseman 1932). Johannes de Nova Domo's students contribute to the dissemination of Albertism in Paris and in German universities. Lamberto da Monte from Paris writes a commentary on Pietro Lombardo's *Sentences*, in which reference is made to Albertus Magnus. Lamberto's work provides evidence of the existence, in the first decade of the fifteenth century, of an Albertist school at the faculty of theology in Paris (Meliadò and Negri 2011). A commentary on Aristotle's *De anima* defined as "Albertist" and written in the first half of the fifteenth century is owed to Johannes Wenck (Haubst 1951, 1955, 1957a).

A particularly prominent Albertist fellow is Heymeric de Campo. He studies in Paris under Johannes de Nova Domo, and since 1421, he works at the University of Cologne. Heymeric becomes also regent, with Rutgerus Overhach of Dortmund, of a *bursa* at the University of Cologne, later called *Laurentiana* in honor of Friesen Laurentius Buninch of Groningen, who officially founded it in 1440. In 1423, Heymeric de Campo starts a controversy with the Thomist

Gerard de Monte. The *Tractatus problematicus. Problemata inter Albertum Magnum et Sanctum Thomam* initiates the dispute. In this treatise, Heymeric lists 18 *Quaestiones* against which Albertism is distinguished from Thomism. The *Quaestiones* are sorted by topic following the Aristotelian science. The controversy ends in 1456 with an *Apology* by Gerard de Monte (Meersseman 1935). From 1425 to 1433, Heymeric de Campo frequents Nicholas of Cusa (Hamann 2006; Fiamma 2016). They are both averse to Thomism and share a neo-Platonic metaphysics (Haubst 1952; Colomer 1964) inspired by Albertus Magnus' paraphrase of *Liber de causis*. Examples of these positions are found in Heymeric de Campo's *Tractatus problematicus* (Hoenen 2008), *Compendium divinorum* (Anzulewicz 2009) and *Colliget principiorum* (Calma and Imbach 2008, 2013), and Nicholas of Cusa's *De coniecturis* (Mojsisch 1998; Senger 2014).

In the 1440s, some German followers of Albertism, such as Heymeric de Campo, Johannes Wenck, and Johannes Hulshot of Mechelen, start mitigating their polemical attitude towards the other currents of the *via antiqua*, seeking to reconcile with them. In 1435, Heymeric de Campo is offered a teaching post at the University of Louvain with the remit of tackling the Hussite heresy (Hoenen 1994). Heymeric's writings from this period reveal his rapprochement with Thomist positions. Yet the dispute with Gerard de Monte goes on until 1456. In 1453, Heymeric writes *Centheologicon*. The influence of Nicholas of Cusa's works is evident (Imbach 1983; Fiamma 2017). Johannes Wenck becomes a professor at the University of Heidelberg and in 1442 writes *De ignota litteratura*, where he accuses Nicholas of Cusa to have espoused Meister Eckhart and the Beghards' ideas. In this pamphlet, Wenck's views are in line with the *via antiqua* orthodoxy, what has led some interpreters to consider him a Thomist master. In 1442, in Cologne, Johannes Hulshout writes a commentary on Aristotle's *De anima* (Patin 1976). Heymeric de Campo's influence on this work is clear, despite Hulshout's intention to maintain it within the realist milieu (Hoenen 1993).

In the mid-fifteenth century, Wessel Gansfort is a prominent figure of the *Bursa Laurentiana* at the

University of Cologne (Braakhuis 1993). Although Albertism has been opposed to nominalism since its beginnings in Paris (Kaluza 1995), Wessel Gansfort tries to reconcile Albertine positions with those of certain currents of nominalism. Later, Gansfort teaches at the University of Heidelberg, personally knows cardinal Bessarion and comes into contact with the Roman Humanism. In the second half of the fifteenth century, the dissemination of Albertus Magnus, Johannes de Nova Domo and Heymeric de Campo's writings in Central Europe leads to the constitution of an Albertist school at the University of Krakow (Kuksewicz 1963; Markowski 1981, 1989). The Polish master Jacob of Gostynin comments on the *Liber de causis* using Albertus Magnus' paraphrase and Johannes de Nova Domo's *De ente et essentia* (Seńko 1961). Some copies of Albertus Magnus and Heymeric de Campo's works, written in Krakow around the mid-fifteenth century, have been recently found (Calma 2012). In Krakow, an autonomous Albertist *via* of studies has probably existed until the early sixteenth century (Seńko 1970; Kaluza 1995; Calma 2012).

Heritage and Rupture with the Tradition

The historiographic category of "Albertism" was used for the first time in the 1930s of the twentieth century (Geyer 1927; Meersseman 1933). Later, many scholars have called "Albertists" those philosophers or theologians who have generally embraced Albertus Magnus' philosophy in method and content (Haubst 1952, 1955, 1957a). However, some scholars have recently challenged the idea that in the first part of the fifteenth century, Albertism was an autonomous movement or a philosophical school (Senger 1981). They rather think that Johannes de Nova Domo and Heymeric de Campo's works simply recording the debates within the *via antiqua*, without implying a coherent philosophical system independent from Thomism. This point is also confirmed by the fact that in the early fifteenth century, neither the *via Alberti* nor any Albertist *bursae* can be founded. In fact, these conditions are realized only in the

second half of the fifteenth century, and only in certain universities.

However, in the Middle Ages, certain philosophical currents are explicitly inspired by Albertus Magnus. In the thirteenth century, Ulrich of Strasbourg and Ugo Ripelin elaborate their philosophical doctrines based on Albert's teaching. In the fourteenth century, some authors who can be considered as "Albertists" in a general sense are Meister Eckhart, Dietrich of Freiberg, and Berthold of Moosburg. It should also be noted that Albert did not transmit a corpus of doctrines to his students but rather a methodological approach. In particular, as a philosopher, Albert attaches great value to natural reason speculation (Zimmermann 1980; Mojsisch 1985; Sturlese 1996) and shows an "appétit pantagruélique" for Arab science and Neo-Platonic philosophy (Wéber 1980). Albertism of the fifteenth century stems directly from the elaborations carried out by Albert's students during the previous two centuries, especially with regard to his philosophical method.

There are also some remarkable elements of discontinuity between thirteenth and fourteenth century Albertism and that of the fifteenth century. "Medieval" Albertism spreads mainly among Dominican monks. Moreover, from a philosophical point of view, it results from a heterogeneous reception of Albert's doctrines. Albertism of the fifteenth century is rather characterized as a movement within universities, which tends to influence the community organization of the Church and the political life in the cities (Hoenen 2003). Furthermore, in the fifteenth century, Albertism represents a philosophical school with a specific corpus of texts taken as reference. So, while medieval Albertism is deeply engaged in discussing theological issues, in the fifteenth century, it has little to do with theology, even though some contributions to specific *Quaestiones* in the debates between the *via antiqua* and the *via moderna* (Wegestreit) on metaphysics and epistemology. Axiomatization becomes important for the fifteenth century Albertism, while it was quite disregarded by medieval Albertism. In fact, in the fifteenth century, Albertist metaphysical works often follow the Euclidean method of

exposition and assume metaphysical positions close to Boethius' *Liber de causis* and *De hebdomadibus* tradition (Meliadò 2013). Medieval Albertism includes many cases of doctrinal intolerance towards Thomas Aquinas' philosophy. Yet Albertists of the thirteenth and fourteenth centuries rarely raise polemic controversy against Thomas Aquinas – except for Dietrich of Freiberg. Instead, Albertism of the fifteenth century rises in contrast to the Thomistic school.

Innovative and Original Aspects

The main element of methodological break with the scholastic tradition introduced by Albertism in the fifteenth century consists in its unprecedented use of Albertus Magnus' commentaries on Aristotle and the *Liber de causis* within universities in explicit opposition to Thomas Aquinas' commentaries. Albertists also criticize the Thomist school about several of their metaphysical and epistemological issues. Scholars, with some exceptions (Senger 1981), generally agree in identifying four original doctrinal points peculiar to Albertism (Meersseman 1935; Haubst 1957b):

- (i) Contrary to Thomas Aquinas, Albertists think that there is no real difference between the essence and the existence of an entity. Johannes de Nova Domo and Heymeric de Campo claim that the existence of an entity flows from its essence (Nova Domo 1409; De Campo 1425, 1434; Cusanus 1445). The essence and the existence are distinguished, Albertists argue, only *secundum modum significandi* and *secundum rationem ratiocinantem*. In other words, they should be regarded as two different modes of the same substance. This view results from a revision of the *Liber de causis* tradition and Albert's doctrine of the flow of entities (Korolec 1981; Meliadò 2012).
- (ii) Albertists think that knowledge of an object is possible without the mediation of phantasms produced by the imagination (Saccon 2015). Scholasticism conceives knowledge as an adaptation of the intellect to the objects.

According to Thomas Aquinas, such adaptation is mediated: sensory species (*sensibilia*) are processed by the senses, while phantasms are processed by the imagination. On this view, different intermediate stages of knowledge allow the intellect to progressively abstract *sensibilia* from perceptions and transform them into intellectual species. Albertus Magnus concurs with this view (Senger 1981). Albertists of the fifteenth century think that if knowledge were based solely on experience, the intellect would apprehend only the species of things and reach an inaccurate knowledge of them. Instead they hold that, after knowing species by sensory experience, the intellect can recognize the same species in himself, but in a more precise and refined way. The assumption here is that the intellect has in himself the species of external things but in a cognitive way (*modus*). In *De venatione sapientiae*, Nicholas of Cusa's attributes this conception to Proclus.

- (iii) Albertists reject Aristotle's idea that prime matter is devoid of any determination and form. They think instead that created matter conveys, *inchoata*, a seed of form. This claim is also found in Albert's writings (Nardi 1960; Hossfeld 1980; Rodolfi 2004). Albertus Magnus and Ulrich of Strasbourg rely on it to affirm the full presence of soul in the embryo (Park 1980). Albert also argues that the formal potential of seeds emerges thanks to the influence of stars movements (*eductio formarum*). Albertists of the fifteenth century, however, are less interested in astrology than Albert. This doctrine derives from Augustine of Hippo's conception of seminal reason.
- (iv) Albertists claim that universal concepts are really present in things. This allows us to count Albertists among realists (De Libera 1996). However, they also recognize that the reality of universals is no guarantee of our ability to know them (Kaluza 1988). This position, which constitutes a middle way between realism and nominalism, is shared by Johannes de Nova Domo (Weiler 1968;

Kaluza 1986; Rutten 2003), Heymeric de Campo (Meliadò 2012), and Nicholas of Cusa (Fiamma 2015).

Impact and Legacy

The legacy of Albertism in central Europe in early modern age is still to be clearly defined. Its main consequence for fifteenth-century philosophy is the introduction in European universities of some elements of Neo-Platonism and the opposition to Thomism. In this sense, Albertism has contributed to the crisis of scholastic philosophy and the renewed interest in Neo-Platonism which takes root in the second half of the fifteenth century thanks to the Italian Renaissance.

Albo, Joseph

Born: c. 1380, Aragon/Spain

Died: c. 1444, Castile/Spain

Abraham Melamed

Department of Jewish History, The Center for the Research of Jewish Culture, University of Haifa, Haifa, Israel

Abstract

Joseph Albo (c. 1380–1444) was a Jewish philosopher active in Christian Spain during the first half of the fifteenth century. His main opus *Sefer ha-Ikkarim* (*Book of Principles*) was

completed in Soria, Castile, in 1425. Albo was active in the last phase of medieval Jewish philosophy and thus was strongly influenced by his predecessors, mostly Maimonides, his teacher Hasdai Crescas, and Simeon ben Zemah Duran. He was well acquainted with the Muslim philosophic heritage, mainly Averroes, as it was translated into Hebrew during the thirteenth and fourteenth centuries. Being active in Christian Spain, he was apparently also acquainted with scholastic philosophy, mostly Aquinas, which influenced the formation of this thought. Facing the Catholic Church persecution of the Jews in Spain, especially since the anti-Jewish riots of 1391, and the Christian increasing pressure on Jews to convert, Albo actively participated in the Jewish anti-Christian polemics of his period. Although Albo is not considered an original thinker, and much of his book consists of summaries of the ideas of previous scholars, still he significantly contributed to the history of Jewish philosophy in two areas: the theory of principles and the theory of law. He condensed Maimonides' 13 principles of faith to the fundamental three: the existence of God, the divine origin of the Torah, and reward and punishment. In his legal theory, he was the first to introduce the scholastic notion of natural law to Jewish philosophy, thereby revolutionizing it.

Biography

Little is known concerning the details of Albo's life. He was born in Aragon around 1380 and died in Castile around 1444. He studied in the academy of the great scholar of the period, Hasdai Crescas in Saragossa, Aragon, and was strongly influenced by his thought. In 1413–1414 he played a dominant role in the public Christian-Jewish disputation at Tortosa, in which Geronimo de Santa Fe (formerly Joshua ha-Lorki), a Jew who converted to Christianity, represented the Pope and delegates from many Jewish communities in Spain represented Judaism. Albo represented the Jewish community of Daroca, in

Aragon. Later he moved to Soria, in Castile, where he apparently spent the rest of his life. Albo's important contribution to Jewish philosophy is his *Book of Principles*, Albo (1929–1930) composed in medieval Hebrew and completed around 1425. Albo apparently knew Spanish and Latin. He apparently made a living as a Rabbi and preacher, and possibly also as a physician.

The *Book of Principles* is essentially an apologetic treatise; its main aim is to prove that Judaism is the true divine religion, since it is the only one which fulfills the criteria of divine law. In this respect it was an integral part of the Jewish anti-Christian polemics of this period. It was written in order to address the deep social and religious distress of the Jews residing in Christian Spain, strengthen their spirits and their Jewish identity, and provide them with arguments to counter the Christian anti-Jewish polemics. The intended reading public of this book were not only a small group of scholars but also the broader audience of lesser educated Jews, who needed this kind of support. This is why it was written in a relatively simple and clear manner, unlike most medieval philosophical books in Hebrew, which are difficult to decipher. This is also why its impact was quite considerable during the consequent centuries.

Albo developed in the first part of the treatise an elaborate theory of law, as a logical basis for his system of principles. On the basis of the Aristotelian theory of the political nature of humans, he argued that the rule of law is essential for the existence of an ordered society. Following scholastic influences, he distinguished among three kinds of law, which appear in an ascending order: natural law, which is the inherent human understanding that political association is essential for sheer survival; human law, which fulfills the urge for a better and more refined human society; and finally, divine law, which aims to direct humans to the knowledge of God, through the obligation to fulfill the divine commandments as elaborated in the Mosaic constitution. Natural law stems from the understanding of the natural processes; human law is created by humans in the political association, while divine law is bestowed upon humans by verified divine

revelation. The traditional position found in medieval Jewish philosophy distinguished between two kinds of law only, human and divine (for instance, Maimonides, the *Guide for the Perplexed* 2: 40). Albo was the first Jewish scholar who introduced natural law, in the political sense, into Jewish philosophy and thus revolutionized the Jewish theory of law. He was directly influenced here by the scholastic theory of natural law, as exemplified by Aquinas. Albo most probably knew Aquinas' legal theory, although he never mentions him.

The theory of principles is thus superimposed by Albo on his theory of law. The principles of faith are derived from divine law. Albo endeavored to create a new system of principles of faith in Judaism. He followed in Maimonides' path, but challenged him in the same time. Maimonides was the first Jewish scholar ever to create a system of obligatory dogmas of faith. One should remember that Judaism, unlike Christianity, is traditionally not based upon dogma, but upon the obligation to obey the practical commandments. Maimonides argued that a Jew should not only obey the Mosaic commandments but should also hold the essential minimum of true theological opinions. His 13 principles, thus, introduced a novelty into the conception of Judaism. In later medieval Jewish thought, there was a fierce debate concerning Maimonides' rationalism, in general, and his system of principles, in particular. The question was twofold: Is it permissible at all to create a system of principles in Judaism, and if so, which and how many such principles should be included in the system? Albo was quite critical of Maimonides' radical rationalism, being more of a traditionalist. He agreed with Maimonides that principles of faith are essential for a Jewish identity, but strongly differed with him concerning their selection and number. In the first part of the *Book of Principles*, he debated and rejected the various systems of principles which were proposed since Maimonides. Contrary to Maimonides' 13 principles, Albo condensed the number of principles to the bare minimum, three essential principles without which Judaism cannot exist in his view: the existence of God, the divine source of the *Torah*, and

reward and punishment. There is a logical order here: The first principle is the cornerstone of the whole system. The divine origins of the *Torah* are based on the belief in the existence of God, and reward and punishment is based upon the duty to obey the *Torah*. All other beliefs are presented as necessary logical derivations thereof. Each of the principles (*ikkarim*) logically leads to further beliefs stemming from them, called "roots" (*shorashim*); these lead to a third layer of less important beliefs, called "branches" (*anafim*). Albo thus proposed a semi-logical structure in which the whole theological system is necessarily derived from the minimal most essential true opinions.

Each of the following parts of the *Book of Principles* is devoted to the discussion of one of the three essential principles. Concerning the existence of God (second treatise), Albo introduces a prolonged discussion of divine attributes; concerning the divine origins of the *Torah* (third treatise), Albo discussed human perfection, prophecy in general and Mosaic prophecy in particular; concerning reward and punishment (fourth treatise), he discusses divine providence, the problem of evil, repentance, and the world to come.

The *Book of Principles* was practically the last great theory of principles of faith produced in Jewish thought. Isaac Abravanel, who was active in the late-fifteenth century, completely rejected the validity of such systems, arguing that the whole *Torah* is one big principle; it is not for humans to decide which of the beliefs of the *Torah* is more or less important; they are all equally essential.

The book was popular in the following centuries, especially after the first printed edition appeared in 1485, one of the first Jewish books of Jewish philosophy to be printed. The fact that it was written in a relatively simple style, contained summaries of earlier Jewish thinkers, and appeared in print very early made it popular among Jewish scholars of subsequent generation, practically up to the Jewish Enlightenment. The book was later translated into Latin, German, Italian, and other languages, which made it accessible to Christian scholars also.

Alchemical Medicine and Distillation

Laura Sumrall

History and Philosophy of Science, University of Sydney, Sydney, Australia

Abstract

Alchemical medicine – often termed “chemiatria” or “iatrochemistry” – was a part of Renaissance chymistry that sought to purify the body into its most ideal state of health and, at its height of ambition, to extend human life indefinitely. To this end, alchemical physicians utilized distillation to produce medicaments from plant, mineral, and animal matter. Much like the chrysopoetic ambition to purify base metals into gold, distillation presented a potent means of purifying natural substances through the separation of subtle essences and medicinal waters from the impurities of gross matter.

Synonyms

Chemiatria; Iatrochemistry; Spagyria

Heritage and Rupture with Tradition

Alchemical distillation as it was performed in the Renaissance would still be familiar to a modern chemist. The process would always involve some application of heat to a mixture in order to separate through evaporation the more subtle or purer substances into a vapor, which would then be condensed into a separate vessel upon cooling. The distillate could then be distilled further to increase its purity. The apparatus used, much like a modern distillation apparatus, included a heat source, vessels for the mixture and the distillate, and a tube or dome for conveying and condensing the distilled vapor into the receiving vessel. Renaissance alchemists would commonly use an earthenware furnace and a glass vessel with its neck elongated into an angled tube, such as a retort or alembic. Most alchemical medicines were distilled from a mixture of various ingredients and a solvent such as *aqua vitae* (typically distilled wine) (Forbes 1970; Schneider 1972; Newman and Principe 1998; Principe 2013).

Distillation long predates the medieval period, but it was in the twelfth and thirteenth centuries that the terminology and techniques foundational to its alchemical context were imported into the European intellectual tradition from Classical and Arabic texts. Prominent alchemists from this period include Franciscans Roger Bacon (ca. 1214–ca. 1292) and John of Rupescissa (ca. 1310–ca. 1366), who borrowed from the pseudepigraphical works of Jābir ibn Ḥayyān (“Geber”) when they wrote about purification through distillation, with the goal of producing the purest possible distillate or *quintessence*, “fifth essence.” This medical elixir perfectly isolated natural potency, allowing boundless material transformation and serving as medicinal panacea, with the potential to extend human life indefinitely. More commonly, distillation was used to study the health benefits of spa waters and to separate healing “waters” (typically alcohols or oils) from gross matter, which could be used in the production of primarily herbal medicaments (Multhauf 1966; Newman and Jābir 1991; Eamon 1994; Newman 2004).

By the fifteenth century, alchemical distillation and attendant apothecaries had become a widespread ancillary to Galenic humoral medicine, in which the body's four humors, sharing the qualities of the four Aristotelian elements, could be regulated by the same alchemical techniques that claimed to manipulate elemental mixture. However, the spread of alchemical medicine would be primarily catalyzed in the following century with the iconoclastic works of the famous physician Theophrastus Bombastus von Hohenheim, or Paracelsus (1493–1541). Paracelsus drew from the new Platonic/Neoplatonic and Hermetic texts introduced to the West by Marsilio Ficino (1433–1499) to produce a new natural philosophy positioned in opposition to scholastic Aristotelianism and Galenic medicine. He reconceptualized human physiology in terms of alchemical separation and purification, allowing the body to serve as a microcosmic analog to the greater macrocosm. By the end of the sixteenth century, Paracelsus' works and those of his successors, especially Petrus Severinus (1540/1542–1602) and Jan Baptista van Helmont (1579/1580–1644), would make alchemical medicine and the perfection of health central to a new chemical philosophy aimed at the perfection of nature as a whole (Pagel 1958, 1982; Debus 1978, 2001; Newman and Grafton 2001; Shackelford 2004; Webster 2008).

Impact and Legacy

Physicians after Paracelsus, such as Andreas Libavius (ca. 1550–1616) and Daniel Sennert (1572–1637), would follow his ambitious exhortation to produce medicine through the separation and purification of natural substances in the laboratory without necessarily subscribing to all of his philosophical ideas. Many physicians publishing in the seventeenth century in fact continued to draw from both new and old medical theory and practice, and alchemical medicine was also eventually taught alongside Galen in many early modern universities. In general, however, alchemical medicine was characterized by a lack of institutional regulation enjoined with a tradition of secrecy and deliberate textual obfuscation. In this context, the

number of self-identifying alchemists selling questionable pills and elixirs – and the general accessibility of alchemical medicine to unlearned upstarts – ensured an enduring association between alchemy and charlatanism. By the eighteenth century, physicians like Hermann Boerhaave (1668–1738) would introduce a terminological distinction between chemistry and alchemy in order to legitimize their work as distinctly chemical. Nevertheless, this superficial distinction belies the continuity between alchemical medicine and later medical tradition, which continues to reflect the techniques and ambitions of its alchemical heritage (Moran 1991, 2005; Clericuzio 1993; Grell 1996; Debus 2001; Newman and Principe 2002).

skills, being able to handle a wide set of natural and artificial substances: they developed techniques aimed at transmuting base metals into gold and silver and were expert in the production of medicines, tinctures, pigments, and glasses. These practices were embedded in a complex and diversified natural philosophy, which relied on specific theories of matter and was to different degrees influenced by contemporary religious and medical ideas. Although never included in the curriculum of medieval universities, alchemy was an important and controversial topic in the Middle Ages. Metallic transmutation was a matter of philosophical discussion, part of the wider scholastic debate on the relations between art and nature. Fourteenth-century alchemical treatises show an increasing influence from religious themes and imagery, which start molding the very descriptions of alchemical operations. A century later, elements of Ficino's Neoplatonic philosophy and Christian cabala had a significant impact on the humanistic writings on alchemy, which was significantly reconfigured. Moreover, medical uses of the alchemical elixir were strongly emphasized by fourteenth- to fifteenth-century alchemists, who anticipated the development of Paracelsian iatrochemistry. After Paracelsus's medical reorientation of alchemy, the fierce debate on his system left its mark in sixteenth- to seventeenth-century alchemical and medical writings, which led iatrochemistry to find a new institutional home, namely, early modern universities.

Alchemy

Matteo Martelli

Humboldt Universität zu Berlin, Berlin, Germany

Abstract

Between the fourteenth and seventeenth centuries, alchemy reached its full maturity in the West. Alchemists mastered high professional

Heritage and Rupture with the Tradition

In the fourteenth century, the main streams of Arabic alchemy had been already assimilated in the West through the medieval translations of the treatises of Balīnās, Jābir b. Ḥayyān, or Abū Bakr

al-Rāzī. The authors of the first Latin works on alchemy – often ascribed to the same writers of the translated texts, such as Geber (the Latinized Jābir), Rhazes, and even Avicenna (despite Ibn Sīnā's well-known critique against transmutation in his *Kitāb al-Šifā'*) – recombined and reshaped earlier theories and practices (Principe 2013, pp. 27–58), thus paving the way for the development of new and influential lines of thought, as they are found in wide-ranging corpora of alchemical texts falsely attributed to the Catalan scholar Ramon Llull (ca. 1232–1315) and the doctor Arnald of Villanova (1240–1311).

One of the earliest works of the ps.-Llullian corpus (Pereira 1989), the *Testamentum* (ca. 1330), defines alchemy as the hidden part of natural philosophy that teaches how to produce the philosophers' stone or elixir (Latin translation of the Arabic *al-iksīr*). As the highest product of alchemical operations, the philosophers' stone was considered capable of perfecting any kind of "body": it could turn base metals into gold and silver, convert stones into gemstones, and bring human bodies to their healthiest condition. Embedded in a strong philosophical framework (with clear influences from the scholastic tradition), ps.-Llull's account represents an influential and sophisticated version of the elixir theory, a cornerstone of medieval and early modern alchemy (Pereira 1995). While the Jābirian method (as inherited, e.g., in ps.-Avicenna's *De anima in arte alchemiae*; see Moureau 2013) instructed the practitioner to make the elixir by processing vegetal, organic, and mineral substances, most fourteenth-century alchemists considered only minerals among the valuable ingredients of this alchemical compound *par excellence*. This approach is clearly adopted in some prominent treatises of the ps.-Arnaldian corpus (Calvet 2011), such as the *Rosarius philosophorum*: here the role of mercury is strongly emphasized in accordance with the so-called theory of "mercury alone," already developed in ps.-Geber's *Summa perfectionis* (Newman 1991). The liquid metal, as primary constituent of metals (according to the mercury-sulfur theory), is the prime matter to which they must be reduced: after being purified and

sublimated many times, mercury is divided (through distillation) into the four elements, which are each processed in order to obtain liquid, oily, or earthy products. These products are mixed together and reduced either to a white or to a red powder. After being respectively combined with a small amount of silver or gold (acting as ferments), the two powders can both transmute base metals into silver or gold and heal any disease in the human body.

Comparable operations based on mercury are described in Guillaume Sedacer's *Sedacina* (end 14th c.; it includes a large section on glassmaking; see Barthélémy 2002) and in the *Liber lucis* by the Franciscan John of Rupescissa (Halleux 1981), who thought that apocalypse was about to come. Rupescissa strongly believed that the secrets of alchemy were to be revealed in order to provide the Church and its followers with the gold they would have needed to contrast the Antichrist. Such an intertwinement between alchemy and religion is well attested in fourteenth-century alchemical treatises, such as Petrus Bonus' scholastic defense of alchemy titled *Margarita pretiosa novella* (1330; Crisciani 1976) and ps.-Arnald's writings. Petrus expanded the earlier idea of alchemy as *donum dei*: only God may reveal to alchemists the real knowledge about the transmutation of matter, as He already did to ancient prophets (such as Adam, Moses, David) and poets (Ovid and Virgil), who all allegorically spoke about alchemy. On the other hand, ps.-Arnald's *Tractatus parabolicus* (1350) developed a close comparison between the transformation of mercury and the passion of Christ, in which quotations from the Old Testament were read as hidden alchemical instructions.

Both ps.-Llull and ps.-Arnald clearly emphasized the medical properties of the alchemical elixir, thus contributing to establish a new and long-lasting interplay between alchemy and medicine. The quest for a universal medicine, identified by the abovementioned authors with the elixir, intensified in the fourteenth and fifteenth centuries. Inheriting and expanding Francis Bacon's ideas on the prolongation of life, alchemists and physicians attributed great properties to gold as the perfect metal and started discussing the

medical uses of alchemical gold (Crisciani 2003). Ps.-Llull's *Testamentum* (II.18) and ps.-Arnald's *De vita philosophorum* (X) include similar recipes for the so-called potable gold: the first gives instructions to reduce gold to a dry powder and dilute it in the spirit of a plant called *Lunaria*; the second describes how to make gold as soft as butter and dilute it in aqua vitae. John of Rupescissa emphasized the centrality of aqua vitae, basically a distillate of wine already discovered by medieval doctors. In his influential treatise *De consideratione quintae essentiae omnium rerum*, he identified the "water of life" with the quintessence: by distilling wine several times, he believed to extract its quintessence, i.e., a substance corresponding to the Aristotelian eternal matter of the heaven. Similar procedures were applied to many substances, such as gold and other metals traditionally considered toxic (e.g., mercury, lead), which could be alchemically transformed into powerful medical tinctures. An expanded version of the treatise was later incorporated into the ps.-Llullian corpus under the title of *Liber de secretis naturae seu de quinta essentia*, which emphasized the role of quintessence in the preparation of the philosophers' stone and contributed to identify to a certain extent the two alchemical compounds.

Innovative and Original Aspects

Between the fifteenth and sixteenth centuries, alchemy became widespread in Western Europe, and hundreds of alchemical manuscripts were copied down and started circulating among princes, scholars, and practitioners. Along with the "classical" treatises attributed to medieval alchemists, new alchemical compendia were handed down. For instance, in the second half of the fifteenth century, the *Elucidarius artis transmutationis metallorum* by the Italian alchemist Christophorus Parisiensis still identified the three main goals of alchemy with the preparation of medicines, glassmaking, and metallic transmutation (Crisciani and Pereira 2001). The same author is credited with writing two alchemical works in Italian, *Violetta* and *Sommetta*: indeed, European

vernacular languages started being increasingly used to compose alchemical prose texts and poetry (Pereira 1999; Kahn 2010). Occitan and Catalan translations or adaptations of Latin alchemical texts are already attested in the second half of the fourteenth century, such as the Catalan *Cantinena* that accompanied ps.-Llull's *Testamentum* (Pereira and Spaggiari 1999). Alchemical Middle English collections include, for instance, anonymous verses explaining how to make the elixir (Timmermann 2013) along with the alchemical corpus ascribed to George Ripley (d. ca 1490), heir and interpreter of the ps.-Llullian tradition (Rampling 2010). Jean de la Fontaine's didactic poem *Fontaine des amoureux de science* (1413) combined practical instructions with allegorical elements, while in fifteenth-century Germany, a new genre of alchemical writings was developed, namely, the *Bildgedicht*, well represented by the anonymous poem *Sol und Luna*.

Despite the criticisms expressed by many humanists – such as Petrarch, Erasmus, and Leon Battista Alberti (Matton 1995) – alchemy was well received by the Neoplatonic philosopher Marsilio Ficino (1433–1499), who identified the alchemical elixir or quintessence with the cosmic principle he called *spiritus mundi*. This identification, which presupposed the possibility of extracting the "spirit of the world" through alchemical operations, led to an important reorientation of alchemy (Matton 1993; Newman 2008). Under Ficino's influence, Giovanni Aurelio Augurello (ca. 1456–1524) composed his poem *Chrysopoeia* (1515), written in an elegant classical style (mainly inspired by Virgil's *Georgics*), which quickly became a reference work for Renaissance alchemists and bequeathed an enduring legacy until the end of the seventeenth century (Kahn 2010). Augurello expanded the elixir-*spiritus mundi* equivalence with concepts and practices he probably drew from "classical" alchemical treatises, such as ps.-Geber's *Summa perfectionis* and Petrus Bonus' *Margarita pretiosa novella*. Moreover, he presented alchemy as part of the *prisca sapientia* that had been already revealed by classical authors and proposed alchemical interpretations of many classical mythological accounts (e.g., Jason's quest for the

Golden Fleece). Alchemy was progressively integrated in a new conceptual framework including natural magic, astrology, and Christian cabalistic ideas. Strongly influenced by Pico della Mirandola (1463–1494), the Venetian priest Giovanni Agostino Panteo developed a “cabala of metals” in his two works *Ars transmutationis metallica* (1519) and *Voarchadumia contra alchimiam* (1530; Forshaw 2013). Moreover, Ficino’s ideas were received by the German magician and astrologer Heinrich Cornelius Agrippa von Nettesheim (1486–1535): in his *De occulta philosophia* (1531), he described metals as animated elements, permeated by a celestial spirit that could be extracted and used for transmutation. He is probably the author of the short tract *De arte chimica* – often attribute to Ficino between the sixteenth and seventeenth centuries – where the philosophers’ stone is prepared by treating gold with philosophical mercury, able to release the divine spirit embedded in the precious metal (Matton 2014).

The chemical medicine (also called *chymiatría*, iatrochemistry, or *spagyria*) developed by Theophrastus Bombastus von Hohenheim, commonly known as Paracelsus (1493–1541), caused another dramatic shift of perspective in the history of alchemy. Heir of a long tradition of skepticism against metallic transmutation, he denied that alchemy could transform metals into gold or silver. On the other hand, he strongly emphasized the role of alchemy as a fundamental pillar of his anti-Galenic medical system, which included also astrology and natural philosophy. Precise correspondences between macrocosm and microcosm guided the practice of physicians, who had to learn how to handle a complex set of pharmacological compounds (e.g., *arcana* and *magisteria*). Paracelsus reshaped the traditional mercury-sulfur theory and added salt as the third basic constituent of metals. These *tria prima* are cosmic principles, but they are not unique. Since they give account of the qualities of each mineral (and in general, of all things), each mineral is formed by a particular kind of mercury, sulfur, and salt, which determine its specific features. These principles are contained in the seeds (*semina*) that, after being planted in a matrix

(mainly composed of water), grow up and produce their “mineral fruits” (Hirai 2005). Through alchemical operations (distillation, sublimation, putrefaction), it was possible to isolate/purify the three principles and recombine them in new and powerful medicines. Paracelsus inherited the tradition of alchemical medicines linked to the preparation of distilled quintessence and potable gold, yet substantially expanded it by exploring the properties of a large body of mineral substances: any mineral, even if toxic as such, could be alchemically processed and transformed into a healthy remedy. This attitude contributed to test the properties of new minerals, such as antimony, which entered the laboratory also of those authors who reintegrated *chrysopoeia* in their practice, such as the alchemist Basil Valentine (Principe 2013, pp. 138–153).

Impact and Legacy

Already at the end of the sixteenth century, the earliest Paracelsians began editing and interpreting Paracelsus’s works, few of which were published during his lifetime. The first edition of a large selection of his writings appeared in the 1590s (published by Johann Huser under the title of *Bücher und Schriften*), and Paracelsus’ system soon became a matter of fiery debate among physicians and alchemists (Kahn 2007). The efficacy of the new alchemical pharmacology was largely discussed along with various aspects of Paracelsus’s theory of matter. Petrus Severinus (1540/42–1602), Joseph Du Chesne (1546–1609), Oswald Croll (1560–1608), and Jean Baptiste van Helmont (1579–1644) reassessed the role and nature of the three principles in relation to the *semina* and the four Aristotelian elements (Hirai 2005). This debate on elements and principles interacted with the development of modern atomism and corpuscular theories of matter (Clericuzio 2000), as emerging, for instance, in the works by Andreas Libavius (1555–1616) and Daniel Sennert (1572–1637), professor of medicine at the University of Wittenberg (Newman 2006). Critical of Paracelsus’s magic and many fraudulent and sacrilegious aspects of his doctrines,

Sennert and Libavius had a deep knowledge of medieval alchemy. Libavius' work *Alchemia* (1597; second expanded edition 1606) describes the preparation of hundreds of medicines, by emphasizing the medieval origins of iatrochemistry, deeply rooted in ps.-Arnald's, ps.-Llull's, and John of Rupescissa's alchemical works. With his vigorous prose, Libavius strove to cleanse iatrochemistry of its mystical and obscure elements and to define a new *chymia* founded on Aristotelian philosophy and experimental practice (Moran 2007). A similar effort to ennoble alchemy (and make it appealing to learned humanists) was shared by Michael Meier (1568–1622), who composed the *Atalanta Fugiens*, a book of alchemical emblems, where alchemy was explained through fifty images taken from earlier alchemical authorities and accompanied by pieces of poetry, prose, and music (Principe 2013, pp. 173–178).

Alchemical theories and practices widely circulated in the seventeenth century. European printing presses issued hundreds of alchemical treatises, often grouped in famous collections (e.g., the *Theatrum Chemicum* in six volumes; 1602–1661). At the same time, iatrochemists reinforced the tradition of handbooks (already inaugurated by Libavius), such as Jean Beguin's *Tyrocinium Chymicum* (1612), where *chymia* (called also *alchymia* or *spagyria*) was defined as the art of dividing (*diakrisis*) and combining (*synkrisis*) substances. New professors of *chymiatría* (e.g., Johann Hartmann) were appointed in German universities (Newman 2008): they based their teaching on the abovementioned textbooks and emphasized the central role of laboratory practice, essential for students to learn how to produce the new pharmaceuticals. An even stronger experimental approach guided the work of George Starkey (1628–1665), an American alchemist committed both to producing commercial products and to exploring metallic transmutation. The influence that his experimental procedures had over Boyle's work (Newman and Principe 2002) exemplifies the significant contribution that early sixteenth- and seventeenth-century alchemical theories and practices offered to the foundation of modern academic chemistry.

Alciato, Andrea

Born: Alzate or Milan, 1492

Died: Pavia, 1550

Carmen Palomo Pinel

Facultad de Derecho, Universidad CEU San Pablo, Madrid, Spain

Abstract

Andrea Alciato was a Renaissance jurist who lived both in Italy and France during the first half of the sixteenth century. He approached

the study of law, mainly Roman law, in a new way, bringing into the school of jurisprudence studies such as philology and epigraphy. This new humanistic point of view about law is called *mos gallicus*, as it was widely spread in France. He is also well-known for having created a new literary genre, called “emblematic literature.” An emblem consisted in a short title, a painting, and a short poem with moral content. Alciato's *Emblemata* were highly appreciated and spread along the whole Europe in his time and in the following centuries.

Biography

Andrea Alciato was a jurist, moralist, and humanist writer, a true paradigm of the Renaissance man. He mastered classical languages at his early youth and studied law at Pavia, where he moved in 1507 to receive the teaching of famous jurists such as Jason of the Maino and Filippo Decio. Later on, he moved to Bologna (1511), although he won his doctorate at Ferrara in 1516, shortly after publishing his first legal works in Strasbourg.

Firstly, he worked as a lawyer in Milan but soon moved on into the teaching of law. Moreover, he never gave up his classical studies and even published a comment on Tacitus in 1517.

He is considered to be the founder of the *mos gallicus*, a way of approaching Roman law which consists in applying a historical, philological, and juristic method of analysis to ancient texts, a method that deeply differed from the practical-oriented one of the *mos italicus*. However, his fine juristic sense was always aware of the great value of medieval glossators and commentators' studies, and he never rejected their achievements just because of their lack of philological accuracy. His judgment about his predecessors was always balanced, as he was able to discern the limits of the historical reconstruction of law and the value of an innovative, creative, and useful interpretation of the law, adjusted to his time's need, in the tradition of Bartolo of Sassoferrato. Alciato soon won a highly respected position among the most important European jurists of the time, such as Budé and Zasius.

His increasing prestige got him an invitation to teach as a professor in Avignon, where he remained from 1518 to 1522. In the meantime, his renown put him in acquaintance with Erasmus of Rotterdam and won for him the title of palatine count from Pope Leo X.

In 1522, he returned to Milan, where he was able to concentrate in his studies and gave birth to his translations of the *Anthologia graeca* and of Aristofanes' work. Nevertheless, those were convulsive times because of the war between France and Spain, and in 1529, the very king of France, Francis I, invited him to lecture in Bourges. Then a very fruitful period started, in which he published two very important works: his *De verborum significatione* and the *Commentarii ad rescripta principum*.

A new appointment led him to the Senate of Milan, then again to Pavia, until 1537 and, finally, to Ferrara. Pope Paul III offered him to become a cardinal, but he rejected, although he did accept the appointment as apostolic protonotary. Later on, he was appointed by Francesco Sforza to the Senate of Pavia, the city where he remained until his death. A big monument of him was settled in St. Epiphanius church. Afterward, it was moved to the University of Pavia, where it now can be admired.

Among his most important works, in addition to the already mentioned ones, we can also note his *Rerum patriae, Opusculum, Paradoxa iuris civilis, Dispunctiones, Praetermissa, Annotationes in tres posteriores libros Codicis Iustiniani*, the treatise *De eo quod interest*, his commentary to the title *De verborum obligationibus, Parerga, In Stellam et Longovallium, De singulari certamine seu duelli*, etc.

Despite having obtained his main achievements in the highly technical field of law, Alciato's most popular and widely spread works were, undoubtedly, his *Emblemata*, with which he indeed founded a new literary genre. Alciato had translated some Greek epigrams to Latin, and went on writing his own ones, with a moral content. They were published by Steiner in Augsburg in 1531 for the first time, with the title of

Emblematum Liber. They consisted in a short title followed by a drawing – the *emblem* – showing a symbolic content and, finally, a short poem referred to it. The number of emblems was extended, and in 1550, just 1 year before Alciato's death, the definitive edition of the *Emblemata* was published in Lion by Rouille and Bonhomme, consisting of 211 emblems. This innovative work got a wonderful acceptance in the whole Europe, and during the sixteenth and seventeenth centuries, there were about 150 different editions of the work, made by the best European publishers.

Aldine Press

Shanti Graheli

University of Glasgow, Glasgow, UK

Abstract

The Aldine Press was one of the foremost humanist publishing enterprises in the Renaissance. The firm was founded by Aldus Manutius the Elder in partnership with Andrea Torresano and aimed to publish the canon of classical antiquity. While the partners were soon forced to diversify production, the prestige and cultural cachet of the press were unmatched. The press was supported by popes, kings, and prominent individuals for much of its lifetime. Aldine editions were among the most valued in Christendom, both for their textual accuracy (though this was not always reliable, as scholars soon discovered), for their role in bringing unpublished texts to light, and for their brand value. In its later years, the press declined due to the mismanagement of the last member of the Manuzio family to be involved in the printing world – Aldo Manuzio the Younger.

Heritage and Rupture with Tradition

The Aldine press takes the name from its founder Aldus Manutius, who took up printing in Venice

in 1494 (the best biographic profiles are Infelise 2007; Davies 1995, 2019). Aldus was a grammar teacher for most of his life, until he moved to Venice and set up a printing press. Initially he operated alone in an establishment called *Thermae*, near Sant'Agostino (Fletcher 1988); it was his encounter with the Venetian printer and publisher Andrea Torresano that led to the great success of the Aldine Press. Torresano was an experienced book merchant and a former employee of Nicolas Jenson (Davies 1995, 2019). In 1479 he had purchased Jenson's press and printing materials and set up a business of his own. The encounter with Aldus took place in the early 1490s, and in 1493 Torresano printed the first edition of Aldus' *Institutiones grammaticae*.

We do not know how the early discussions regarding a possible collaboration unfolded, but later documents show how they were finalized. A partnership was formed for the publication of the Greek classics in their original language, a program based on Aldus' own concept. His material contribution was negligible; Aldus owned one-fifth of Torresano's portion of the business. The Venetian patrician Pierfrancesco Barbarigo, a "silent" business partner, contributed the remaining half. It is known from Aldus' own assertions that he was busy for a few years trying to achieve a suitable font of type that was created by the typefounder Francesco Griffo of Bologna. Aldus' awareness of the value of this type is demonstrated by the privilege that he obtained from the Venetian authorities to protect their investment. The text of the privilege, describing the Greek type "of the utmost beauty," prevented others from publishing or importing books printed in Greek (or translated from the Greek) for 20 years (Barker 1974).

The Aldine Press became operative in 1494, though it was in 1495 that it undertook its most significant project, the five-volume Greek Aristotle (1495–1498). The works of Aristotle were obviously not new on the marketplace of print, and indeed Torresano himself had produced several folio volumes in Latin translation. But this was the first attempt to produce the philosopher in the original language. Aldus' effort was really aimed at creating a universal companion to

Aristotle, as he proposed himself to publish the full canon accompanied by its early Greek commentators, printed as separate editions (Sellars 2004). The effort was somewhat thwarted by the difficulty of laying hands on manuscripts for all the texts, as was the case with *Rhetoric* and *Poetics* that were not available to Aldus by 1498 (this was remedied in 1508, when both works were printed). Aldus himself only published some of the Aristotelian commentators, while several other volumes were printed by his heirs in subsequent years. While the accuracy of the Aldine texts has been questioned by modern scholarship, he certainly was more accurate than his heirs. Various editions published after his death were treated with little care – a case in point is the 1525 Galen, published despite a gap in the text amounting to a hundred pages or so (Durling 1961).

In the first 20 years of its activity, the Aldine Press issued more first editions of Greek texts than any other press (Sandys 1903–1908). In this venture, Aldus' humanist network provided tremendous support for the search of manuscripts, the editing of texts, and the proofreading of printed matter. The support of such a network also enhanced the credibility of the Aldine Press as a humanist venture. Scholars at the Studio at Padua were the natural recipients of the Aldine Aristotelian venture, and indeed the changes in the teaching of philosophy at Padua had a direct connection with the publishing program (Sellars 2004). Aldus' friend and collaborator Marcus Musurus was appointed to the new Aristotelian chair in Padua, established with the explicit intention of reforming the teaching of the philosopher. The key to the new trend in Paduan Aristotelianism was to revert to the original sources, without the intermediation of Averroism; Aldus' manifesto for the printing of Aristotle in the original Greek, following the most correct manuscripts, went hand in hand with such ideology.

While the effort was admirable, it soon must have become clear that the Greek volumes were not flying off the shelves, despite their identified Paduan readership. Measures to insulate the press from financial losses became urgent, prompting sales and publishing strategies to be devised. To

the dismay of Aldus' humanist supporters, the Press started to diversify its output by producing the Latin classics and even the modern Italian canon. This line of production was associated with the *enchiridia* or "*libelli portatiles*," the first book series proper, issued in large print runs and hugely successful. The *enchiridia* soon became the flagship editions of the Aldine Press and were purchased for many princely libraries in Europe (Lowry 1979; Graheli 2016). Many of these were even printed on vellum, intended for prominent customers; regular copies were produced on especially thin paper that enhanced their portability (Harris 2019a). For these volumes Aldus commissioned a new font that imitated a cursive hand and allowed for a more compact presentation of the text while retaining a light-weight appearance: Francesco Griffo's italics (McLeod 2015). Similarly to the Greek type, the italics was also patented and protected by a privilege, though it was soon imitated throughout Europe.

Other marketing strategies were also implemented. The Aldine Press was the first to produce formal retail catalogues for its customers, with base prices and a full description of content (Lowry 1998; Graheli 2016; Harris 2019b). The descriptions of the Aristotle set were particularly detailed and indeed remained unaltered throughout their permanence in stock. Three such catalogues are known to have been issued during Aldus' life (1498, 1503, 1513), though it is possible that more may have existed and are now lost; all three are reproduced in various printed studies (Orlando 1975; Dionisotti 1995). The three catalogues, all held in a copy in the MS Grec 3064 in the French National Library, are also freely accessible online on Gallica.fr. The recent study by Martin Davies and Neil Harris reproduces the three early catalogues, with the difference that the 1513 catalogue is given in the lesser known copy from the Municipal Library in Udine (Davies and Harris 2019). This copy is made particularly important by the presence of contemporary integrations that the authors have shown to be by a collaborator of the press (Harris 2019b).

These catalogues evolved over time, alongside the understanding of customers' needs and

requirements. The first catalogue was a single-sheet item printed on one side, materially not too different from the early stock lists produced by the likes of Erhard Ratdolt and Albert Kunne, though this one was clearly addressed to buyers external to the book trade. The second catalogue was set up as an oblong booklet and presented the typologies of volumes available at the time by introducing a separate section at the end, "*Libelli portatiles in formam enchiridii*," for the pocket-size titles. Most importantly, this catalogue presented for the first time the opening address "*Aldus Studiosius*," "*Aldus to the scholars*." The third and final catalogue issued during Aldus' lifetime was printed in his famous italic type and compatible in size and layout with the folio volumes issued by the Press. Indeed, the Udine copy has survived bound together with the Aldine edition of Niccolò Perotti's *Cornucopia* (Harris 2019b). It is quite possible that more catalogues will resurface in similar circumstances, bound at the front or at the rear of other such copies.

The same format presented in the 1513 catalogue was followed for the catalogues issued by the Press for the next 20 years or so, after Aldus' death in 1515. Two undated lists survive from the 1520s, one dated to around 1520 and the second to around 1526 (Harris 2019b); both were typeset following the earlier catalogue as a model, retaining the structure and the order of the items. A third, from the first half of the 1530s, is almost certain to have existed and is documented in a handwritten copy (Fletcher 2011). These later catalogues continued to present themselves with Aldus' address to the scholars, and indeed even the 1563 catalogue issued by Paolo Manuzio, Aldus' son, retained the heading "*ALDVS STVDIOSIS*." Aldus continued to be the banner of the Aldine marketing strategy until its end and to be included in the Aldine imprints in various forms after his death. Both Paolo and Antonio Manuzio, sons of Aldus, fashioned themselves as such ("*Aldi filius*," "*in aedibus Manutianis*," etc.). Paolo's son, Aldo Jr, went as far as adopting the effigy of his grandfather and namesake as the firm's new brand mark. In the last decades of the sixteenth century, under the leadership of Aldo Manuzio the Younger, the press introduced the

innovation of stock catalogues published regularly as part of its publications. Such lists were inserted on any blank space available at the end of the printing operations and thus can usually be found either at the end of the text proper or at the end of the preliminary matter (the last gathering to be printed in an early modern edition). The practice was to become widespread in Europe by the end of the sixteenth and the start of the seventeenth century as a way to communicate available stock to customers.

The Aldine Press strived to preserve the same aura of scholarly prestige after the death of its founder. Initially the sons of Aldus were too young to be involved, and a period of some 12 years followed where the Torresano were entirely in charge of the business. Andrea Torresano engaged with the day-to-day management of the press from Aldus' death in 1515; from 1517 he receded to a less active involvement, and the direction of the press was taken on by his youngest son, Gian Francesco Torresano (Cataldi Palau 1998). Still a teenager at the time of Aldus' death, Gian Francesco probably learnt much by living in close contact with him and often referred to Aldus in the most affectionate tones and in the hope of following in his footsteps. He was proficient in the Greek language and he continued to publish the Aristotelian commentators and other planned Greek texts in significant numbers (Cataldi Palau 1998). Earlier editions that had sold out were also reprinted, sometimes with significant textual improvements that were stated in the prefaces. In addition, Gian Francesco preserved and often improved Aldus' navigational tools for the use of texts and made further contributions to the development of the critical apparatus by developing and enhancing the lists of alternative *lectiones* (Cataldi Palau 1998).

Through the dedications that bear his signature, Gian Francesco appears to have been well connected within the Venetian Patritiate and committed to securing patronage for the Aldine Press. The firm continued to seek the support of diplomats and eminent figures, following previously established practices. The studies by Cataldi Palau and H. George Fletcher show that it was Gian Francesco, not Aldus, who had been friends

with the French Treasurer of Milan, Jean Grolier, one of the key patrons of the firm (Cataldi Palau 1998; Fletcher 2015). The relationship with Grolier shaped much of the French circulation of Aldine editions, especially within the court circles; in later years he was even involved with the practical arrangements for the sales of books in Paris.

While Gian Francesco Torresano directed the Aldine Press since 1517, his father Andrea remained involved with the business and presumably continued to oversee the overall management until his death in 1528. At this point, with the three sons of Aldus coming of age, the delicate equilibrium that had held the two families together collapsed. A phase of about 12 years followed that saw various attempts at restoring agreement between the two parties, with sporadic efforts at joint publication as well as solo editorial activities on both sides. The printing shop ceased all activities between 1529–1533 and 1537–1539, following furious arguments essentially about the right to use Aldus' name, his types, and his legacy.

By the end of this period, the collaboration between the Manuzio and the Torresano had ended. As a result of the dispute, the sons of Aldus and their uncles, Gian Francesco and Federico Torresano, parted their ways. The Torresano brothers printed various new editions (both alone and together), though Gian Francesco engaged almost exclusively in the activity of bookseller and agent. As mentioned above, it was through his intermediation that Aldine editions were sold in France, where he represented both the Torresano and the Manuzio families (Cataldi Palau 1998). His son Bernardino was active as a printer in Paris between 1554 and 1570, with a printing shop in the Rue Saint-Jacques at the sign of the dolphin and anchor. His imprints were signed "in Aldina Bibliotheca," underlining the intended continuity with the work of the Aldine Press.

Paolo Manuzio was the one among the sons of Aldus who continued to uphold the family name through the business of printing (his brother Antonio printed only a few editions in Bologna). After the end of the dispute with his Torresano uncles, the Aldine Press issued some 200 editions

in Venice under the denomination: “the heirs of Aldus Manutius,” as well as some in Paolo’s name alone. During Paolo’s leadership, the press was associated with two external entities: the Accademia Veneziana and the State of the Church. The Accademia Veneziana, founded by the Venetian Patrician Federico Badoer, was a scholarly association devoted explicitly to a universal publishing program (Bolzoni 1995; Graheli 2013). Paolo Manuzio was specifically recruited as the main printer for this venture, undoubtedly thanks to the long-lived prestige of the press. A program of about 600 titles had been proposed by the society in the first instance, promising an extensive effort to make available texts that were by then hard to come by (Rose 1969; Bolzoni 1995; Graheli 2013). The planned titles were for the most part in Latin, intended for an international audience, though generally with an eye on the ideal education for members of the Venetian Patriate. Aristotelian texts and commentaries were prominent among the philosophical texts, though they were offered in Latin translation and not in the original Greek. Only some 20 editions were printed by Paolo Manuzio and other collaborators for the Accademia Veneziana (Renouard 1834; Graheli 2013). Despite being born under good auspices, the Accademia ended abruptly in 1561 and in circumstances that remain unclear. It would seem that Federico Badoer had over-extended financially, as suggested by surviving letters of exchange; in his ambitious plans, he had possibly exceeded his position and attracted the wrath of the Venetian Republic (Graheli 2018).

The Aldine Press seemingly was not involved in Badoer’s malpractices, and it continued to operate as it had done previous to this collaboration. The timing of Paolo’s move to Rome in 1561 may suggest that he was eager to change his surroundings, though certainly the events had not damaged his reputation, as he was invited by Pope Pius IV to direct the Stamperia del Popolo Romano (Barberi 1942; Fletcher 1998). This was a role of great prestige and responsibility that entailed the publication of texts approved by the Council of Trent. Such editions required the utmost accuracy and attention to detail, and it is not accidental that

the Papacy should wish to have them associated with the great venture of the Aldine Press. A contract spelled out the agreement of what was to become “the first privileged Vatican press” (Sachet 2013). Paolo continued to be involved with the Aldine Press in Venice, now managed by his son Aldo the Younger, as demonstrated by the regular correspondence between Rome and Venice (Pastorello 1957, 1960). The Roman venture ultimately proved just as frustrating as the partnership with the Accademia Veneziana. While various important editions were published (namely, the Tridentine catechism and breviary), production was slowed down by the involvement of prominent prelates and received uneven support after the untimely death of Paolo’s patron, Pope Pius IV, in 1565. Paolo himself left Rome for Venice in 1570, returning to the Eternal City in 1573. He died there in 1574.

During Paolo’s absence in the 1560s, and after his death in 1574, his son Aldo the Younger continued to manage the Aldine Press in Venice. Business was run with the support of Paolo himself and long-term friends of the firm such as Marc-Antoine Muret through the regular exchange of letters, many of which contained proofs of works under the press. The venture proceeded initially under the famous printer’s device of the dolphin and anchor, though in later years the brand was redesigned to portray the head of Aldus the Elder. Despite attempts to follow in the founder’s steps, the press gradually declined, to the extent that in its final years at the end of the sixteenth century, it had mainly receded to the sale of remainder titles. Since 1576, Aldo had struck an agreement with Niccolò Manassi for the management and running of the Aldine bookshop (Nuovo 2018). When Aldo left Venice to take up a chair of rhetoric in Bologna, then in Pisa, and finally in Rome, Manassi remained in sole control of the business. As it turned out at Aldo’s death in 1597, his debts amounted to a staggering 3000 ducats. Manassi, soon married to Aldo’s widow Francesca Giunti, tried unsuccessfully to find a solution to financial ruin, first by attempting to sell Aldo’s famous library and then by involving the Venetian Republic in the management of the debt. Despite his attempts, the Aldine Press ended

in bankruptcy and with little of the prestige it had enjoyed during its early years (Nuovo 2018).

Impact and Legacy

Already during Aldus' lifetime, Aldine editions achieved a status of collectible items. Today they remain some of the most desirable printed books from the Renaissance, to the extent that many patrimonial libraries place these items in their rare books section, with no relation whatsoever to their actual rarity (most Aldine editions survive extremely well, although even here discoveries of undocumented editions can still happen). This practice testifies to the importance of Aldine editions in the canon of Western culture. Among the most resilient editions by the Press were the monumental Greek edition of Aristotle, already mentioned; the numerous editions of Cicero produced especially under Paolo Manuzio; and the famous enchiridia. The citations in early modern inventories, often identifying Aldine editions under the name "Aldus," are suggestive of the continuous connection to the charismatic founder in establishing the market value of these books. While the press declined significantly in quality and prestige in its later years, the importance of its early output remained untarnished. Many of the editiones principes established by the Aldine Press were used for a long time as the chief reference to several Greek classical authors.

Aldrovandi, Ulisse

Born: 11th September 1522, Bologna

Died: 4th May 1605, Bologna

William M. Barton

Ludwig Boltzmann Institut für Neulateinische Studien, Innsbruck, Österreich

Abstract

Ulisse Aldrovandi was an Italian polymath with particular interests in natural history. In his own time Aldrovandi enjoyed wide recognition for his activity as a collector of natural curiosities and for his extensive library. In 1561, he became the first professor of natural history at the University of Bologna. It is for his work in this field, beginning with the publication of the encyclopedic and beautifully illustrated *Ornithologiae* in 1599, that he is best known today.

Biography

Ulisse Aldrovandi was born into a noble family. His father, Teseo Aldrovandi, served the senate of Bologna as a secretary, while his mother, Veronica Marescalchi, was a relative of Pope Gregory XIII. An episode early in his life seems to reveal

Aldrovandi's inquisitive nature even at a young age: At 12 he left home and his family "without money and with a bold spirit" to satisfy his desire to see the city of Rome (Frati 1907). Upon returning to Bologna soon after, Aldrovandi began studying mathematics with Annibale della Nave, one of the city's foremost scholars in the field. Mathematics would be the first in a long list of studies to which Aldrovandi dedicated himself throughout his career. It led to his employment as a bookkeeper to a group of merchants in Brescia. By 1538, however, Aldrovandi was back in Bologna. Keen to learn more of the world, he went again to Rome and from there travelled to Spain, following the pilgrimage to Santiago de Compostela.

Once again at home, Aldrovandi now began to study law and by 1542 was working as a notary in Bologna. On the point of qualifying to practice law, however, Aldrovandi had a change of direction and around 1546 he went to Padua to follow courses on philosophy, mathematics, and medicine (Montalenti 1960). This path would bring him into conflict with the Church, presumably on account of Padua's reputation as a centre of Averroism in Italy (Castellani 1981), and Aldrovandi was accused of heresy in 1549. In September of that year, he travelled to Rome to exculpate himself and was pardoned following the election of Pope Julius III (Ottaviani 2013).

Aldrovandi's stay in Rome would prove formative for his later career. Once free of suspicion, Aldrovandi came into company with Guillaume Rondelet, then working as a physician in the city, with whom he developed his interest in anatomy and natural history. Returning to Bologna, he studied medicine and philosophy at the university where he graduated in 1553 (Frati 1907). In this context he met Luca Ghini, with whom he advanced his knowledge of botany and organized extensive herborizing trips to the surrounding countryside. One noteworthy example of these excursions took place in 1554, when Aldrovandi travelled to Monte Baldo on the shores of Lake Garda in the company of several prominent botanists of his day including Luigi Anguillara, Luigi Alpagio, and Francesco Calzolari. By now, Aldrovandi was teaching at the university of Bologna. He first gave courses on logic, then

philosophy, and by 1556 he was lecturing on simples (medicinal herbs). Aldrovandi was instrumental in effecting an important step forwards in this field at Bologna when, in 1568, a botanical garden was established in the city at his insistence (Montalenti 1960).

Aldrovandi became professor of natural history at Bologna in 1561. Alongside his work at the university, Aldrovandi also fulfilled several public functions, including his role as *protomedico* (a public health official) for Bologna's College of Physicians. His work in this position brought him into conflict with the city's apothecaries in a dispute over the composition of the popular cure-all "theriac". After a drawn-out quarrel, during which Aldrovandi was removed from his public post, the case was eventually decided in Aldrovandi's favor by Pope Gregory XIII, and he was restored to honor in 1577 (Andreoli 1961; Olmi 1977).

An avid collector of books and natural historical objects, Aldrovandi's museum and library achieved Europe-wide fame within his own lifetime and, thanks to his decision to leave the collections to the city and University of Bologna, their importance continued to be recognized into the centuries after his death (Tugnoli Pattaro 1988; Bacchi 2005; Duroselle-Melish and Lines 2015). Aldrovandi began his efforts to publish the enormous amount of encyclopedic material he had collected throughout his career only later in life. The project began in 1594 when Aldrovandi made a contract with Venetian editor Francesco Franceschi, but the time-consuming nature of his endeavor to make a meticulous and richly illustrated inventory of the natural world meant that Aldrovandi saw only a small part of his work see print before his death in 1605. The volumes produced in Aldrovandi's lifetime were followed by the posthumous publication (1605–1688) of his remaining studies. These works, however, adhered less strictly to Aldrovandi's exacting standards (Aldrovandi 1929; Montalenti 1960).

Alemanno, Yohanan ben Isaac

Born: c. 1435, North Central Italy

Died: After 1506

Andrew Gluck
New York, NY, USA

Abstract

Yohanan Alemanno was an early Jewish Renaissance thinker engaging in multiple disciplines such as philosophy and kabbalah and affected by varied traditions. He was relatively neglected, given his talents and possible influence, but has lately been discovered more and more by researchers. Many of his writings have still not been sufficiently explored and his views never fully investigated or subjected to logical analysis.

Biography

Alemanno (Allemanno), Yohanan (Jochanan) ben Isaac (c. 1435–after 1506) is an Italian Jewish philosopher, kabbalist, biblical exegete, social and political critic, and an early ecumenical participant. Many believe he was born somewhat earlier than 1435. His place of birth was somewhere in North Central Italy. Some (such as Moshe Idel) believe he might have lived till as late as the 1520s in Israel, but we don't know when and where he died. The name reveals his Ashkenazic origins, and his father's family seems to have come from France, but he may have been descended from Sephardim on his mother's side. He was heir to the entirety of the medieval and Renaissance Jewish tradition. Indeed, the range of his scholarly interests is astounding. Although interest in him has been increasing at a rapid

pace, most of his writings are still in manuscript form and unavailable to most readers. Much of his life remains a mystery as well, but he left deep traces in Jewish Renaissance thought and actively involved himself with Giovanni Pico della Mirandola, the well-known Christian Hebraist and Kabbalist. Alemanno was well versed in the ancient philosophical traditions and the now well-known philosophical literature emerging from the Islamic world. He was also influenced by lesser-known Islamic thinkers such as Abu Bakr ibn Tufayl (a philosopher and mystic) as well as Christian medieval philosophical writings. These extremely wide-ranging interests create some difficulties in pigeonholing him into a specific category and may account for his relative neglect.

Umberto Cassuto's article in *Encyclopedia Judaica* from 1971 lists four works: *Heshek Shelomo*, *Einei ha-Edah*, *Hai ha Olamim*, and *Likkutim*. B.C. Novak, in 1982, supplemented that list with three others: *Shir ha Ma'a lot li-Shlomo*, a supercommentary to Moses of Narbonne's commentary on Abu Bakr ibn Tufayl's *Hayy ibn Yaqzan* and an untitled Kabbalistic work on alchemy, astrology, and magic. Since both *Heshek Shelomo* and *Shir ha Ma'a lot li-Shlomo* deal with King Solomon or the *Song of Songs* (formerly attributed to him), Novak seems to have considered them to be one work. Cassuto, who at other times stressed Alemanno's relationship to the Florentine school of Ficino and Pico della Mirandola, played down that relationship in the encyclopedia article, only mentioning that della Mirandola "wished to become his student in Hebrew literature."

That question regarding the extent of bi-directional influence between Alemanno and some contemporary Christian scholarship has been a source of contention, but most recent research acknowledges it to at least a limited extent. The degree to which Pico was influenced by him and when they first came into contact is not really known. A more apposite question, perhaps, is the extent to which Alemanno utilized that relationship to refine his own opinions and beliefs rather than simply to reinforce them. It is well known that Jewish and Christian scholars were working with very similar sources and therefore

that identity in source material may seem a more parsimonious explanation for similarities than explicit influence from polemically opposed religious persuasions. Alemanno apparently obtained his humanistic interests in rhetoric from Judah ben Yehiel Messer Leon, with whom he studied. It is not fully known from whence he obtained his knowledge of Kabbalah. Alemanno and many of his contemporary Christian scholars were well versed in and influenced by Kabbalah. Indeed, Alemanno seems to take that esoteric tradition as almost certain knowledge. Yet he seems to have rejected its theurgic aspects, and Moshe Idel went so far as to say he changed the very essence of Kabbalah. This required Alemanno at times to work around it in a similar manner to the way religious, philosophical, or esoteric thinkers work around the Bible. One example is Alemanno's acceptance of the superiority and purity of the Jewish soul in contrast to that of Gentiles. But he also stresses the root of that purity and superiority in the quality of kindness, as contrasted with the root of the souls of the other nations in judgment or severity: thus, ethicizing the priestly and pagan concept of purity. Other strong beliefs of his stemming from the Kabbalah are metempsychosis and the inherent relationship between sin and impurity. It seems that for Alemanno, redemption is achieved through the mechanism of rebirth of souls within the Jewish people. This is also metaphysically connected to the unification of God in the *Sefirot*. The action of the soul on the body is likened to the action of God in the *Sefirot*. Quite likely, there is a strong pantheistic element in his thinking.

A. Melamed has written on Alemanno's inherited prejudice against Blacks as symbols of bestiality, cruelty, and slavishness, thanking his student, Michael Reuveni, for pointing this out to him in its full intensity. Reuveni wrote his doctoral dissertation on this part of the *Hai ha Olamim*. Perhaps more interesting than Alemanno's inherited prejudices, however, is the underlying political and social thought to be found in his description of the (Black) despot. The story lends itself to a more hidden interpretation though this is far from certain. The tyrant is indeed described as a Black man, but what seems

more original is his description as being large, strong, sexual, and angry. These are pejorative descriptions that could well have been taken from medieval philosophical writers such as Maimonides; but Alemanno is functioning in a Renaissance environment in which political power is more highly respected among intellectuals (such as Machiavelli). Perhaps a large stature and animalistic qualities are actually keys to effective leadership? In this case, the more normative qualities of moral goodness seem to adhere to those who are the victims of the tyrant. Biblical allusions that are rather confusing when fully analyzed might raise questions regarding who is really virtuous and who is vicious. Clearly the Black tyrant is vicious, but those Whites who propel him to power by their own weakness and destitute nature (and are supposedly virtuous) are described in similar terms to those who supported David against Saul. This seems strange. Are those supporters of the tyrant who resemble the supporters of King David virtuous, weak, or both? This raises profound questions regarding the ambiguous nature of political virtue that we cannot definitively attribute to Alemanno; but his mode of description surely raises the possibility of a nuanced notion of politics, something characteristic of his great contemporary: Isaac Abrabanel. While there was surely a connection between those two contemporary thinkers in other areas as well, the degree of influence is disputed.

In 1976, Arthur M. Lesley translated some of the *Heshek Shelomo* as part of his doctoral dissertation and made some of Alemanno's work available to the general public for the first time. This work shows Alemanno's utter acceptance of kabbalistic categories alongside astute philosophical expertise. One of the subjects dealt with is love, a rather common Renaissance theme. Alemanno shows at least a superficial acquaintance with classical literature on the subject but perhaps filtered through medieval translations or commentaries. He insists that passionate love (*hesheq*) is the highest level of love, apparently departing drastically from Maimonides and the Jewish medieval philosophical tradition. He also seems to misinterpret Aristotle's love of the useful by equating it with a father's love for his offspring,

whereas Aristotle in the *Nicomachean Ethics* is confounded by the apparently irrational, unjust, and excessive love of parents for their children and conjectures (among other explanations) that they love their children as a *part* of themselves. What seems to emerge from this discussion of Alemanno is the perceived need to justify passion, something that had previously been dealt with by Crescas and Albo, and which would also be the subject of his younger contemporary (and son of Isaac Abrabanel) Leone Ebreo in his well-known *Dialoghi d'Amore*. Perhaps the importance of Hayy ibn Yaqzan for Alemanno lies in the fact that the love between Hayy and the antelope that nurtured him was a decisive factor in his single-handed construction of a valid religious/philosophical worldview. This also coheres with the Renaissance fixation on a-rational passions. But Alemanno's elevation of passion shows the most similarity to Leone Ebreo than to the other thinkers that have been mentioned.

Moshe Idel has been perhaps the most innovative and incisive of all contemporary commentators on Alemanno. Idel, perhaps in a groundbreaking manner, appreciated the unique combination of kabbalistic and philosophical knowledge in this great thinker and in the Italian Renaissance generally. Previously, the Jewish thinkers of the Italian Renaissance had been somewhat underappreciated among those interested in Jewish philosophy and mysticism. Idel was willing to admit strong magical (but not theurgic) tendencies in Alemanno as well as profound philosophical ones and analyzed the essential difference between magic and theurgy. He pointed out Alemanno's indebtedness to ibn Latif and Abraham Abulafia, as well as to other better-known Kabbalists. He also pointed out some of Alemanno's more radical opinions, such as that Moses ordered the production of the Golden Calf.

Idel's student, Brian Ogren, has ventured even further in the study of Alemanno as regards specific topics and the deep analysis of specific texts. One of the topics that he deals with is Alemanno's revolutionary distinction between the words of God and the thoughts of God. This is pregnant with creative and useful possibilities though too often contaminated by a facile acceptance of Kabbalistic traditions that may not be particularly helpful or conducive to

religious/philosophical progress. Nevertheless, the basic concept is a useful counterfoil to prior naïve readings of religious texts that clearly defiled their literal meanings in an attempt to make them more acceptable. The deep distinction between thoughts and words allows for literal accuracy in the reading of texts and a deeper investigation into the purposes of the language used, as in rhetorical or persuasive uses of speech. Another important view, commented upon by Ogren, is Alemanno's insistence that the biblical *Tohu* is matter and the *Bohu* is form. This belief might possibly have come directly or indirectly from ibn Gabirol, who refigured Aristotle's hylomorphic metaphysics in a similar fashion.

Fabrizio Lelli, aside from translating some of the *Hai ha Olamim* (perhaps Alemanno's greatest work), has provided us with an entirely new facet of Alemanno's thought that was perhaps muted previously: his great interest in the Portuguese discoveries and explorations and indeed in the wider non-Jewish world. This was a part of a much more general Jewish interest in Messianic redemption, following the expulsion from Spain, forced conversions in Portugal, and other cataclysmic events. But Alemanno's interests seem to go well beyond normal "Jewish" ones and include not only legends about the lost 10 tribes but also about the kingdom of Prester John, a mythical Christian kingdom of Asia or perhaps Africa.

In conclusion, Alemanno emerges as an incredibly curious, knowledgeable, open-minded, and creative thinker. He was a true son of the Renaissance aside from being a faithful adherent of and a fruitful contributor to Jewish tradition. There is no doubt that he was an original thinker. That does not mean, however, that much of his thinking (as is true of all humans) was not unoriginal. As is the fate of most if not all polymaths, he needed to rely upon others and showed himself to be gullible at times. But even within the category of the unoriginal, it is worthwhile to distinguish between mere tacit acceptance of communal prejudices and a more active championing of theories or explanations favored by or at odds with traditional sources. Undoubtedly, all can be found in this thinker, but only the latter is of any great interest insofar as we are interested in him as unique or exceptional or what Karl Jaspers called the "existential will" of the

author. It seems that he may have addressed himself to a diverse audience and he had very definite ideas regarding how to interpret traditional material, but as is the case with almost all pre-modern thinkers, he could not necessarily express all of his beliefs. Since so much of his writings have never really been explored, they are a gold mine for future students with the linguistic skills, intellectual historical knowledge, and philosophical reasoning that would allow them to separate the precious metal from the dross.

Alfonsine Tables

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

The Alfonsine Tables were astronomical tables designed to anticipate the positions of planets, lunar phases, setting and rising times of the Sun, eclipses, heavenly conjunctions, and calendrical dates. They come in two different textual traditions, the Castilian Canons (1272 ca.) and the Parisian Tables (1320 ca.). The first printed Latin edition dates 1483. From that moment, Latin Alfonsine Tables rapidly superseded every other competing tabulary system for anticipating the expected planetary positions, so that the entire astronomy of the fourteenth, fifteenth, and the first half of the sixteenth century may be labelled as “Alfonsine Astronomy.” Nonetheless, starting with Regiomontanus’ *Tabulae Directionum Projectionumque* (1467, first printed in 1485), passing through Erasmus Reinold’s Copernican *Tabulae Prutenicae* (1551), and ending with Kepler’s *Tabulae Rudolphinae* (1627), the history of the legacy of the Alfonsine Tables in the Renaissance is largely a story of their slow but progressive dismissal.

Innovative and Original Aspects

The Alfonsine Tables were astronomical tables designed to anticipate the positions of planets, lunar phases, setting and rising times of the Sun, eclipses, and heavenly conjunctions. Moreover, they were useful for chronological and calendrical computations, often with astrological import. Relevant dates of both Muslim and Christian Julian

calendars could be calculated in advance thanks to their predictive numerical projections, there based on the geocentric Ptolemaic system. Even if their degree of precision was very inaccurate by any modern standard, for more than two centuries, the tables remained in consultation as the best astronomical reference charts available.

“What particularly distinguishes the Alfonsine tables is an advanced precessional theory (which includes a periodically varying term called “trepidation”) and an ingenious sliding sexagesimal scheme that allows the mean motion tables to be used with an arbitrary set of radices” (Gingerich 2011, 506). More specifically, the tables “introduced a complicated motion of the equinoxes, combining a steady motion around the zodiac in forty-nine thousand years with an oscillation of ± 9 degrees every seven thousand years” (McCluskey 2011).

Two “first” versions of them are extant: one with reading rules but no numerical tables and the other one with numerical tables but, at first, no reading rules. (1) The *Alfonsine Canons* are explanatory instructions written in vernacular Castilian around 1272 ca. by two scholars; Isaac ben Sid and Judah ben Moses haCohen, under the patronage of King Alfonso X “the Wise.” They survive in just one manuscript (Chabás and Goldstein 2003) and the tables to which the instructions originally referred to are lost. These updated the anteceding *Toledan Tables*, whose computations were based on their turn on the correction that the Arabic astronomer al-Zarqālī made to the Ptolemaic *Handy Tables*. (2) The *Tables of Paris*, dated 1320 ca., are numerical charts with Arabic numerals and Latin headings, originally with no explanatory rules, but soon supplemented by accompanying instructions provided by many astronomers (Jean de Murs, Jean de Lignières and notably John of Saxony). They seems to be unrelated to the Alfonsine Canons but independently based on different revisions, perhaps on those of Ibn al-Battani.

Historians debated at length on the relations between the two and their originality. What is certain is that Latin Alfonsine Tables rapidly superseded every other competing tabulary system for anticipating the expected planetary

positions, so that the entire astronomy of the fourteenth, fifteenth, and the first half of the sixteenth century may be labelled as “Alfonsine Astronomy” (Pouille 2005). Their completion conventionally corresponds with the inception of geometrical astronomy in the European Universities curricula. Also exploratory expeditions benefitted from the reference to Alfonsine charts for their orientation needs and navigational purposes.

Impact and Legacy

The invention of the movable type printing press offered then the opportunity to give wide diffusion also to astronomical ephemerides, almanacs, and calendars in the newly constituted European book market. Among these publications, Alfonsine Tables found their long-due way to print too. It should be reminded, however, that “users, scribes and bookbinders brought together varied groupings of these tables and canons so that, before the printing of the *editio princeps* in 1483 (roughly the Parisian version), it is impossible to define a set of tables as *the* canonical ‘Alfonsine Tables’” (Kremer 2007, 283), so that a “corpus” is what the Alfonsine standard rather defined. The prints of the various subsequent editions of the Alfonsine Tables marked also the beginning of the descending phase of their reception, since their remaining legacy in the Renaissance is largely a story of their slow but progressive dismissal.

Regiomontanus’ *Ephemerides*, whose first edition appeared in the same year of the aforementioned *princeps* (but circulated before in manuscript form) computed the expected planetary positions up to the year 1506, with minor adjustments to the Alfonsine previsions. In 1467, while in Hungary and with Martin Bylica’s assistance, he had already completed his *Tabulae Directionum Profectionumque*, which exhibited the longitudes of the celestial bodies in relation to the apparent daily rotation of the heavens. There Regiomontanus provided “tables for calculating the house boundaries, with accompanying directions for use. [...] He supplied all tables that

were necessary for casting horoscopes, not including those of the planetary positions, and taught how to use these tables with a number of examples given in the commentary. He also gave instructions for testing and expanding his tables” (Zinner 1990, 92).

In fact, Regiomontanus’ tabulary work was taken up and extended first by Jacob Pflaum and Johannes Stoeffler up to the year 1531, and later, by Stoeffler only, up to 1551, with the addition of supplementary forecasts of impending catastrophes and disasters.

In 1503, Alfonso de Córdoba Hispalensis, a natural scientist, astronomer, and physician at the service of Cardinal Borgia in Rome, published a set of *Tabule Astronomicæ* dedicated to Queen Isabella of Spain. Alfonso chose the date of Queen Isabella’s accession to the throne of Castile – the year 1474 – as new reference starting-point for computing planetary positions (Chabas 2004). The length of the tropical year indicated in these astronomical tables was the same that Copernicus later assumed in writing his *Commentariolus* (Rosen 1976, 172–174), while Luigi Lilio and the Gregorian reformers rather preferred to adopt the old length of the tropical year indicated by the Alfonsine Tables for their calendrical revision (Casanovas 1983).

Often, along those decades, the Alfonsine Tables were repeatedly simplified as “resolved tables,” as they were called, in order to reduce the number of calculations and the amount of computation needed to make a proper use of them. With this purpose, Johannes Schöner published his *Tabulae astronomicæ, quas vulgo, quia omni difficultate et obscuritate carent resolutas vocant* (shortly, *Tabulae resolutæ*) in 1536. Wheel paper charts with rotating concentric discs, called “volvelles,” were often published within astronomical text serving as pop-up computational facilitators for the reader, as notably in Peter Apian’s *Astronomicum Caesarium* (1540).

Copernicus did much practice on the Alfonsine Tables, while he was a student at the University of Cracow; however, at his time that charts were already used in parallel with those made by Regiomontanus. The copy of his personal version of the Latin Alfonsine Tables, in their second

printed edition (Venice 1485), was bound together with one of the first printed edition of Regiomontanus’ *Tabulae Directionum* (Augsburg, 1490); there the two tabulary systems were followed by some blank pages left for calculations, comparisons (Rosen 1976, 167–174), and perhaps for intended corrections. In fact, later in *De Revolutionibus* (1543), Copernicus provided new (partial) planetary tables based on his own heliocentric cosmology. However, the astronomical theory upon which their values were calculated was not so relevant for the practical purposes for which they were mainly consulted by his contemporaries, so that at first much difference was not really noted in the use of his tables over the previous ones.

Later Erasmus Reinold, a Copernican member of the Melanchton’s circle, subsequently composed the *Tabulae Prutenicae* or Prussian Tables (1551), dedicated to Albert I Duke of Prussia and based on Copernicus’ planetary theories. Reference to these tables, as reference to Copernicus’ ones, did not require any commitment to heliocentrism by their adopters (Savoie 1997). Although just slightly superior in terms of accuracy, *Tabulae Prutenicae* gradually superseded the Alfonsine Tables, especially in German speaking countries, even if their acceptance was everywhere slow and disputed.

As signs of different attitudes towards new tabulary systems for planetary astronomy, it can be mentioned, on the one hand, the *Hypotyposes* (1578), later vindicated by Caspar Peucer as a work of his own, where dissatisfaction for Alfonsine data is plain, and, on the other hand, the *Tabulae Gregorianae* (1580) by Giuseppe Moletti, still relying with confidence on Alfonsine settings. Analogously, while few years after *De Revolutionibus* Gemma Frisius in his *De Radio* (1545) recognized the superior predictive capacity of Copernicus’ tabulary emendations, at the end of the century, the mathematician Duncan Liddled was still teaching at Helmstedt both the Alfonsine and the Copernican/Prussian tabulary systems in parallel (1594/95). And in two works that appeared in the same year, *Animadversiones ad ephemerides* and *Breve discorso intorno agli errori dei calculi astronomici* (1580), Benedetto

Altavilla, an astrologist from Vicenza, criticized the reliability of all the astronomical tables and consequently of the ephemerides that were drawn from them. Despite he disregarded the pretension of previsions and forecasts by the way of astronomical tables, he admitted a higher accuracy of the Copernican charts over the Alfonsine ones (Omodeo 2014).

In the second half of the sixteenth century, new updates and revisions did not cease to be sorted out: Johannes Stadius and Giovanni Antonio Magini published, respectively, the *Tabulae Bergenses* (1560) and *Tabulae secundorum mobilium coelestium* (1585), with further numerical improvements.

In 1622, Longomontanus published new tables within his *Astronomia Danica*, called Danish tables, based on the geoheliocentric model of his master Tycho Brahe.

Finally, Johannes Kepler made use of Brahe's tabulary observations as well, but he radically implemented them in his *Tabulae Rudolphinae* (1627) as results of his newly introduced elliptically planetary orbits and peculiar logarithmic methods. In their respect, the Alfonsine Tables turned out to be 30 times less precise on average observations, so that in the short term they were no longer compared and definitively became an obsolete reference tool for modern astronomers.

University of Jyväskylä/Academy of Finland,
Jyväskylä, Finland

Abstract

A major theologian from the early fourteenth-century Iran, al-Ījī is one of the last representatives of the classical Ash‘arite theological tradition. His summa *al-Mawāqif* and his Ash‘arite creed have been crucial in Sunnī teaching and commentary down to our day.

Alternate Names

Qāḍī Abū al-Faḍl ‘Abd al-Raḥmān ibn Rukn al-Dīn Aḥmad ibn ‘Abd al-Jaffār ibn Aḥmad al-Bakrī al-Muṭarrizī al-Shabānkārī al-Shīrāzī.

Biography

Born in 1281 or shortly thereafter in the town of Īj near Shīrāz, al-Ījī flourished during the troubled end-times of the Īlkhānid dynasty. He served the

regime in influential jurisprudential positions but, as the political tide changed, was ultimately imprisoned and executed at his hometown in 1355.

Al-Ījī received his theological education in Shīrāz under a second-generation pupil of the Ash‘arite scholar ‘Abdallāh ibn ‘Umar al-Bayḍāwī. In jurisprudence, he followed the Shāfi‘ite school. As a prolific writer, he produced widely read works in theology, jurisprudence, Qur’anic exegesis, ethics, rhetoric, linguistics, and historiography. His most important theological work is the summa *al-Mawāqif fī ‘ilm al-kalām*, followed by the much shorter *Jawāhir al-kalām*, and the popular creed *al-‘Aqā’id al-‘aḍudīya* that he wrote toward the end of his career. His ethical work *al-Risāla al-shāhīya fī ‘ilm al-akhlāq* follows the tradition of Naṣīr al-Dīn al-Ṭūsī’s *Akhlāq-i nāṣirī*.

In his theological magnum opus, al-Ījī builds on the model, adopted from his lineage to al-Bayḍāwī, which goes back to Fakhr al-Dīn al-Rāzī’s and Sayf al-Dīn al-Āmidī’s earlier summae. By the same token, al-Ījī’s work has many of the features common to the mature theological writing of his time: it builds largely on the wealth of accumulated material but does not shy away from completing an unsatisfactory treatment of the disputed questions or collecting together and rearranging the received discussion in a more systematic fashion. In particular, he tries to incorporate the points of critique made at al-Bayḍāwī’s work by the Māturīdite theologian Shams al-Dīn al-Samarqandī. Following the Rāzīan tradition, he has a high opinion of the supreme value of systematic theological inquiry and structures his work along the lines of a philosophical summa that deals with all the most important fields of knowledge of God and creation.

Despite his debt to the tradition, al-Ījī comes across as a thinker with considerable systematic ambitions. He aims at defending the Ash‘arite doctrine against its critics and in so doing renders the doctrine more precise and complete. An exemplary case in point is his defense of such traditional doctrines as atomism or occasionalism and the inclusion of an extensive discussion and refutation of the Avicennian counterarguments that

had by and large been accepted by al-Rāzī and al-Bayḍāwī. He also engages in an extensive critical discussion of astronomy, here again guided by the overarching Ash‘arite doctrine of a Creator whose omnipotence is not to be compromised by any necessities in the created world.

Al-Ījī’s most important follower was Sa’d al-Dīn al-Taftāzānī, who adopted a reserved stance to the teacher’s doctrine, possibly due to his Māturīdite leanings. More important for the subsequent fate of al-Ījī’s theological magnum opus was the commentary by al-Sayyid al-Sharīf al-Jurjānī. For subsequent generations until the modern times, the *Mawāqif*, like the much more concise creed, remained an influential and much-commented textbook. Indeed, in many ways, it can be seen as the last ambitious summa of the golden era of Ash‘arite theology.

Abstract

A famous Sufi scholar and poet of the fifteenth century, Jāmī's most important philosophical contributions are his commentaries on Ibn 'Arabī.

Alternate Name

'Abd al-Raḥmān Nūr al-Dīn ibn Niẓām al-Dīn Aḥmad Dashtī Jāmī

Biography

A famous Sufi scholar and poet, 'Abd al-Raḥmān Jāmī was born to a notable family in the Khurāsānī village of Kharjerd in 1414. After early education in his hometown of Jām, he moved to Herat and later on to Samarqand to pursue his studies in the Islamic as well as some of the rational sciences. From early on, Jāmī was noted as an exceptionally gifted but arrogant student. At some point in his 30s, Jāmī was initiated into the Naqshbandī Sufi order by the *shaykh* Sa'd al-Dīn Kāshgharī. Facilitated by the intimate relations between the Naqshbandīs and the Timurid

court, Jāmī was promoted to the status of a semi-official representative of the rulers. He maintained a close connection to political power throughout his career, but this did not hinder him from acquiring wide renown as a scholar. Jāmī died in 1492 as one of the most famous authors of the Persian-speaking world.

Today, Jāmī's fame rests mainly on his voluminous poetic inheritance. Although his poems contain plenty of philosophical ideas, from the point of view of philosophy, more important are his prose works. Many of these are devoted to the practice and teaching of Sufism, such as the series of mystical meditations titled *Lawāyeh*, the famous hagiography *Nafahāt al-uns min ḥaḍarāt al-quḍs* (based for a great part on a Persian translation of Abū 'Abd al-Raḥmān al-Sulamī's *Ṭabaqāt al-sūfiyya*), or the treatises on *dhikr* and the question of the unity of existence, a prominent theme in the school of Ibn 'Arabī. The latter's influence is clear also in Jāmī's prolific work as a commentator; he wrote commentaries on the Andalusian's famous *Fuṣūṣ al-ḥikam* as well as its epitome, the *Naqd al-nuṣūṣ*, and on a great amount of Sufi poetry, including works by Ibn al-Fāriḍ, Fakhr al-Dīn 'Irāqī, Jalāl al-Dīn Rūmī, Amīr Khosrow, as well as his own. Jāmī also wrote a number of treatises in a more traditional theological vein, including the famous *al-Durra al-fākhira fī taḥqīq al-madhāhib*, an interesting comparison of Sufism, *kalām*, and philosophy on certain doctrinal questions. Reflecting his activity as a poet, Jāmī authored several works on poetics. He also wrote on music and grammar and compiled an anthology of his own correspondence.

In his poetry, Jāmī was a neoclassical conservative, and his veneration has varied according to literary trends. In his philosophically oriented works, he is a learned follower of Ibn 'Arabī's school who shows thorough familiarity with the most important commentators of the master's works, from Mu'ayyid al-Dīn al-Jandī to Dāwūd Qaysarī. As becomes clear from the *Durra al-fākhira*, Jāmī knew theology and philosophy, referring at length to Sa'd al-Dīn al-Taftāzānī, al-Sayyid al-Sharīf al-Jurjānī, and Naṣīr al-Dīn al-Ṭūsī. The most extensive example of Jāmī's own thought is his commentary on Ibn 'Arabī's

epitome of the *Fuṣūṣ al-ḥikam*. The picture it gives is not of a decidedly original thinker; rather, Jāmī stands firmly in the tradition of philosophical commentaries on the master's works, a tradition which he perceived as being largely unanimous, with differences between the commentators concerning exclusively details of minor importance. In many ways, Jāmī can be considered as the last great representative of this tradition. He played a crucial role in the dissemination of Ibn 'Arabī's thought in Persia, Central Asia, and the Indian subcontinent. This was despite the fact that his strong Sunnism was not always well received in the Ṣafavid dynasty that seized power in Iran soon after his death.

Al-Jurjānī as-Sayyid ash-Sharīf

Born: 1339/1340, Tājū near Astarābādh/
Southeast Iran
Died: 1413, Shīrāz

Jari Kaukua

Department of Social Sciences and Philosophy,
University of Jyväskylä/Academy of Finland,
Jyväskylä, Finland

Abstract

One of the most celebrated theologians and jurists in the fourteenth-century Iran, al-Jurjānī had a major influence on subsequent Iranian philosophy through his commentaries and teaching activity.

Alternate Names

Full name [Zayn al-Dīn Abū al-Ḥasan 'Alī ibn Muḥammad ibn 'Alī al-Ḥusaynī](#); [al-Jurjānī](#); the title of al-Sayyid al-Sharīf is due to al-Jurjānī's alleged descent from a tenth-century Zaydī prince.

Biography

Born in 1339/1340 in Tājū near Astarābādh in Southeast Iran, al-Jurjānī studied in Herat, Kirmān, Egypt, and Asia Minor before settling to

teach in Shīrāz in the 1370s. After Timur's conquest of the city, he was called to the latter's court in Samarqand. There he met with the older colleague Sa'd al-Dīn al-Taftāzānī, which resulted in a famous scholarly rivalry out of which al-Jurjānī is alleged to have come out as the victor – perhaps somewhat unwillingly, for he seems to have held a genuine respect for al-Taftāzānī. After Timur's death, al-Jurjānī returned to Shīrāz where he died in 1413.

Already as a student, al-Jurjānī was famed for his brilliance, and he grew to become a major authority in a number of fields of knowledge. His initial education seems to have been Mu'tazilite, but through his later affiliations, he veered toward the more prominent Ash'arite view, albeit not by a strict commitment for he continued to comment and teach both Mu'tazilite and Shī'ite texts. He is also said to have been involved in Sufism, in particular the study of works from the school of Ibn 'Arabī.

Al-Jurjānī wrote on grammar, logic, jurisprudence, Qur'ānic exegesis, theology, and astronomy. His writing consists mostly of brief summary works and commentaries and seems to have been largely motivated by his activity as a teacher. Despite his influence, al-Jurjānī is commonly considered as belonging to the beginning of the era of Islamic theology in which the composition of original theological summae is largely given up in favor of commentaries and super-commentaries. Indeed, one of al-Jurjānī's most important theological works is the commentary he wrote on 'Aḍud al-Dīn al-Ījī's *Mawāqif*. He also commented on texts by theologians and philosophers such as Avicenna, Shihāb al-Dīn al-Suhrawardī, 'Abdallāh ibn 'Umar al-Bayḍāwī, Naṣīr al-Dīn al-Ṭūsī, and al-Taftāzānī and composed a widely read book of definitions simply titled *al-Ta'rīfāt*.

In his commentary on al-Ījī's theological summa, al-Jurjānī makes extensive use of philosophy and the rational sciences. This is not an entirely novel feature in the later Ash'arite theological tradition; indeed, the impact of philosophy is decisive already in al-Ījī as well as al-Jurjānī's senior colleague al-Taftāzānī, but he seems to have taken the tendency a step further, which is

also highlighted by the fact that within two generations, we witness an upsurge of philosophical activity in Shīrāz that can be traced back directly to al-Jurjānī and his students. Through his commentaries, al-Jurjānī also played an important role in the transmission of philosophy in the teaching done in the theological seminaries (sing. *madrasa*), for texts like al-Ījī's *Mawāqif* were often studied, indeed up to our own time, with the accompaniment of his commentary.

Despite his philosophical refinement, al-Jurjānī was a staunch defender of al-Ījī's conception of theology as parallel to but independent of philosophy. Like philosophy, theology studies the entire creation, but unlike philosophy, it does this under the revealed assumption of a unique omnipotent and omniscient Creator. In particular, the basic principles of theology are independent of the sort of proofs of God's existence that the philosophers had presented and that some earlier theologians had perceived as equally formative for theology. However, al-Jurjānī's commitment to the natural sciences occasionally causes him to depart from al-Ījī's strict Ash'arism, a case in point being the question of whether perceived astronomical regularities are due to real causal connections or merely to a contingent custom ('*āda*) in God's free agency.

Al-Jurjānī was a very influential author, which is attested by the number of surviving manuscripts of many of his works. He was an important influence on the Shīrāzī philosophy of the late fifteenth and early sixteenth century and thereby on the entire later development of philosophy in Iran. Two students of his, Qawām al-Dīn al-Kurbālī and Sharaf al-Dīn Ḥasan Shah Baqqāl, were the teachers of the two rival protagonists in the philosophical scene of the city, respectively, Ṣadr al-Dīn al-Dashtakī and Jalāl al-Dīn al-Dawānī.

Allegory in Renaissance Literature

Nicolò Cristante

Department of Philosophy and Cultural Heritage, Ca’ Foscari University of Venice, Venice, Italy

Abstract

The allegory is not only a rhetorical figure; it is an exegetic, literary, and artistic concept. Grounded in the ancient Greek and Latin traditions, where it is considered as a sustained metaphor, it is developed as a methodology of interpretation in the Patristics and Scholastic Philosophy, becoming an essential notion during the Italian Humanism and the Renaissance.

Heritage and Rupture with the Tradition

The allegory is a rhetorical figure, which is often associated with a metaphor or a simile. By it, the meaning of a proposition, a paragraph, or an entire essay, be it religious, literary, or art does not depend on its logical, semantic, or ordinary grammatical content, but from other interpretations which rest on contextual, historical, or ethical evaluations. It is, essentially, a mode of encoding the ordinary language (Fletcher 2012, pp. 2–3).

Taking cue from thoughts expressed by Aristotle in the “Rhetoric,” the notion of allegory is traced originally within the Latin tradition and particularly in Cicero’s “De Oratore” and in Quintilian. Amongst these authors it is effectively a metaphor which is sustained. It doesn’t in fact end as a single expression within the text (a word or a proposition), but it holds through several paragraphs if not across the entire body of work. There are many ways in which the allegory is presented by Latins: the comparison, the enigma, the riddle. Furthermore, an allegory can morph from something ironical to something which is obscure and of difficult comprehension (Innes 2003, pp. 19–20).

The allegory during the Renaissance derives its roots in the interpretative practice of the Sacred Writings by Saint Paul. The use of the allegory by Saint Paul is *ante litteram* as it comes before the allegory was codified in a literary and artistic figure. Paul, who is influenced by Platonism, behaves as if the text has two interpretations: one is literal or natural and the other is philosophical or conceptual, meant in this case as divine. In this, the allegory assumes a duality of significance: what is written can signify something completely different from its meaning (Tambling 2009, pp. 19–22).

Tracing from Paul’s allegory and from that of classical Patristics and Scholastic Philosophy – particularly the considerations of Hugh of Saint Victor and Thomas Aquinas – the most stable codification of the allegory happens with Italian Humanism in authors such as Dante, Boccaccio, and Petrarca and will be the foundation of the concept of allegory throughout the entire Renaissance. Of significance is Dante’s approach, which defines the end of the religious sphere hegemony of the use of the allegory and lays the ground for its literary development (Brittan 2003, p. 9).

Dante explains his notion of allegory mainly in two works: the *Convivio* and his famous epistle, of uncertain attribution, to Cangrande della Scala (Ascoli 2010, p. 129). Starting from the epistle, one can deduce a proper doctrine of allegory, although still very close to the Patristic exegetic approach; Dante outlines a quadripartition of meaning. The first meaning is the literal one: this is the foundation on which the other meanings will be developed and built upon. The second meaning is the general allegory and itself is divided in three ways. The first mode is the allegory in its proper meaning. This is represented by a punctual and attentive reading of the text, which leads to a more general and abstract meaning than the one denoted by the literal approach. The primary function of this mode is to transcend the worldly semantic field into the fideistic one. The second approach is called “moral.” As inferred by the name, this approach translates its literal meaning into the comprehension of a teaching for the ethical life. The third mode is called “anagogic.” This is the mode of transcendence which understands significance in a manner which parts from a tangible experience and elevates it to a divine perspective, passing from the level of human comprehension to a salvific dimension. At the same time, especially in the *Convivio*, Dante turns his considerations toward a more modern approach, focused on the intentionality of the author and the textual letter (Ascoli 2010, p. 135). In this direction, Dante defines the difference between the theological and poetical allegory, claiming for the second the capability of expressing the truth within beauty through a narrative which is not necessarily real.

Of relevance within the development of the allegory in Britain is the work of Edmund Spenser. In his epic poem, the *Faerie Queene*, he builds on different allegorical levels which are referred, on the one hand, in a philosophical sense to the human mind and, on the other, to the political and social analysis of Elizabethan England. The heir to Chaucer, Spenser develops and evolves declinations of the allegory: in particular the personification (Tambling 2009, pp. 55–61). The value and significance of the allegory within his work is expressed by Spenser himself in a letter to Walter Raleigh (Murrin 2010, p. 175).

During Renaissance but even in general, the allegory is not a composing and interpretative figure exclusively used in religious exegesis and literature. It envelopes art in its entirety: emblematic are, for example, the works of Botticelli, Titian, and Carracci.

Almosnino, Moshe (Moises) ben Baruch

Born: 1510 or 1515, Salonica

Died: 1580, Istanbul

K. E. Fleming

Department of History, New York University,
New York, NY, USA

Abstract

A rabbi, political leader, diplomat, physician, scientist, mathematician, philosopher, and biblical exegete, Moses ben Baruch Almosnino

was one of the most important Jewish leaders in the post-expulsion period and was the central intellectual figure in sixteenth-century Jewish Salonica. Well versed in rabbinic literature, science, and philosophy, Almosnino was also a prolific writer. All around, he was an exemplary “chacham kolel” (lit., “general erudite,” or “well-rounded scholar”) and a great Jewish Renaissance man.

Biography

The Almosnino family originated in Aragon and was well known in Spain already before the expulsions. Sources refer to an Abraham Almosnino, a physician and grandfather of Almosnino’s mother, who was burned at the stake by the Inquisition at some point during the fifteenth century. Almosnino’s other maternal great grandfather, Abraham Conombrial, was also burned at the same *auto-da-fé*. This suggests that members of the family were probably forced to convert to Christianity in the wake of the 1391 pogroms and returned to Judaism thereafter – for which they clearly paid dearly. Another Almosnino, Isaac, is known to have translated Aristotle’s ethics. The translation is no longer available today and is often (mis)attributed to Moshe Almosnino.

The Almosninos likely arrived in Salonica shortly after the expulsion from Spain in 1492, part of the great wave of Jewish migrant to the city, which was rapidly becoming a Jewish haven. Conquered from the Venetian Empire in the second half of the fifteenth century, the *sanjak* (district) of Salonica was part of the Ottoman *eyelet* (province) of Rumeli, which encompassed most of the Balkans and the capital of which was Edirne (Adrianople). Jewish migration to the city, which was somewhat depopulated after the Ottoman conquest, transformed its demographics, with Jews becoming one of its most important communities. As is well known, the Ottomans encouraged Jewish migration to the city: first of Jewish refugees and later of conversos fleeing the Spanish Inquisition. In 1519, soon after Almosnino’s birth, Jews made up about 54 % of

the city’s inhabitants, with more than 15,000. The city’s textile industry was the basis of Jewish economic life. In 1537, an imperial decree made Salonican Jews the main suppliers of uniforms to the Ottoman army, which further strengthened their status in the city. The community was socially and culturally diverse and intellectually vibrant. Being born into a Jewish community that was in effect a local majority shaped Almosnino’s later political thought.

Having received a “classical” rabbinic education from Salonica’s great rabbis, Almosnino began his career as a *marbitz torah* (teacher) and a rabbi in two of the city’s many congregations. His first appointment began in 1553 in the Neveh Shalom congregation, and from 1560 until his death, he led the Livyat Hen congregations. Throughout the period, he was a prominent communal leader in the city as a whole.

Almosnino rose to political prominence in the course of the economic crisis that plagued Salonica’s Jewish community after 1545. That year, fires destroyed life and property and brought disaster to the textile industry. At the same time, global changes (shortages in raw materials, growing competition with English and Italian merchants) caused further economic decline. During the early 1560s, things further worsened because of changes in Ottoman policy, which revoked privileges the community had hitherto enjoyed and which forced it to pay higher taxes. Almosnino, already a leader in the city, was a member of a three-man delegation sent on behalf of the community to Constantinople to please with Sultan Selim II for the reinstatement of lost privileges; he spent 18 months in the Ottoman capital. The delegation met with the sultan five times, without success. The two other members of the delegation – Rabbi Yaacov Ben Nahmias and Rabbi Moshe Baruch – died while in Constantinople. Almosnino remained in the capital and ultimately, after much maneuvering, was able to meet the sultan once more, in 1568, and regained the privileges the community had lost. The success of the mission not only revived Jewish economic life in the city but also ushered in an era of centralized communal life, organized under rabbinic leaderships – as now, the diplomats were the

rabbis. Almosnino enjoyed a high level of status and prestige in the city from this moment until his death.

Another significant outcome of Almosnino's 18 months in Constantinople was a unique travelogue/Ottoman history, written in Spanish: the *Cronica de los Reyes Otomanos*, a detailed description of the city. Almosnino, who was among many other things also a physician, even dedicated a large section to the city's public health and sanitation. Almosnino described his mission to the capital in this way: "When the Great Sultan Suleiman passed through the city [Salonica] he... have many privileges to [its Jews], which disappeared during the great fire in 1545 and thereafter are not respected by the local governor, who imposes even more taxes and levies upon us. This has become too much to bear and for this our noble republic [*nuestra noble republica de Salonique*] chose me to come here to the city."

"Republica," or republic, a term Almosnino uses with some frequency, probably refers to the fact that he was representing the entire community, not just his own congregation. But one can also read the term as a signal of the great autonomy that Salonica's Jews enjoyed at the time, a condition that in Almosnino's mind was translated into "republic." The text, written in Ladino while in Constantinople, was transliterated and translated into "proper" Spanish and published in Madrid in 1638, by a non-Jewish press (an indication of its import), as *Extremos y Grandezas de Constantinopla*. The rest of Almosnino's non-rabbinic works were published by Jewish publishing houses, most in Salonica.

Most of his work was rabbinic, mostly homiletic (midrash) exegetic and commentary (rather than law); he also wrote several commentaries on biblical and Talmudic texts (most notably Pirkei Avot). Steeped in the then-recent new age of print, he also published all of his sermons.

As a Renaissance man, Almosnino was also engaged in philosophy and education – which is probably the main reason for his focus on ethics and science. In this regard, he is part of a cohort of Mediterranean rabbis of the time, among them are Italian Abraham ben Mordechai Farissol (1455–1525) and Joseph Solomon Delmedigo

(1591–1655) of Crete. Like these men, Almosnino drew on a wide variety of Jewish and non-Jewish sources, in Greek, Latin, Arabic, and other languages. His other most famous non-rabbinic book is the *Regimiento de la Vida*, a moral philosophy of conduct, good will, education of the young, and other ethical and moral issues, written at the behest of Don Yosef Nasi. The book was also published in Hebrew as *Hanhagat ha-Hayyim* and can be easily compared to the "guides to life" genre of Early Modern Europe. In 1564 Almosnino also wrote a shorter book *Dreams, Their Origin and True Nature* (*Tratado de los suenyos*), in which he discusses the interpretation of dreams; it was later appended to the *Regimiento*.

Like many other Mediterranean Renaissance rabbis, Almosnino also wrote extensively on geography and astronomy.

Thus Almosnino was at once a typical Renaissance man and a Salonican Jew – and functioned fully as both. A key diplomat on behalf of Salonica's Jewish community, he helped usher in a new era of political power for the city's Jews, even as he maintained an exemplary and wide-ranging, intellectual life.

Al-Nasafi

Born: First quarter of the thirteenth century (?), Nasaf

Died: 1310, Baghdad

Jari Kaukua

Department of Social Sciences and Philosophy,
University of Jyväskylä/Academy of Finland,
Jyväskylä, Finland

Abstract

A Māturīdite theologian and jurist who flourished in the turn of the thirteenth century, al-Nasafī is best known for his jurisprudential textbooks and a creed that became subject to a number of commentaries by subsequent generations of theologians.

Alternate Name

Ḥafīẓ al-Dīn Abū al-Barakāt ‘Abdallāh ibn Aḥmad ibn Maḥmūd al-Nasafī

Biography

Born in the city of Nasaf (the present-day Qarshi, or the Persian Nakhshab, in southern Uzbekistan), al-Nasafī was a famous jurist and theologian who was active during the latter half of the thirteenth century. Apart from systematic treatises in jurisprudence (*fiqh*) and theology (*kalām*), he is also known to have written a volume of Qur’ānic exegesis (*tafsīr*). Al-Nasafī made the major part of his teaching career in Kirmān but came to Baghdad toward the end of his life and died there in 1310.

In theology, al-Nasafī is commonly characterized as a Māturīdite. He is best known as the author of a creed titled *al-‘Umda fī al-‘aqā’id li ahl al-sunna* and a commentary on the same creed titled *al-I‘timād fī al-i‘tiqād*. Both of these works

bear a strong influence of Abū al-Mu‘īn al-Nasafī’s (d. 1114) *Tabṣira al-adilla*. As most Māturīdite theologians, al-Nasafī belonged to the Ḥanafite school of jurisprudence. His jurisprudential masterpiece is said to be the *Kitāb al-manār fī uṣūl al-fiqh*, which he appended with his own commentary titled *Kashf al-asrār*. Other famous jurisprudential works are an extremely concise treatise titled *Kanz al-daqa’iq*, a compendium of rulings that seems to have been directly based on his teaching activity in Kirmān and a book titled *al-Wāfi*, which developed from a commentary on Burhān al-Dīn al-Marghinānī’s (d. 1197) celebrated work *Hidāya* and to which al-Nasafī later appended a commentary titled *al-Kāfi*, also originating from lecture notes. Apart from these original compositions, al-Nasafī wrote commentaries on jurisprudential and theological works, including texts by Najm al-Dīn Abū Ḥafṣ al-Nasafī (d. 1142) and Nāṣir al-Dīn al-Samarqandī. His commentary on the Qur’ān is known as *Madārik al-tanzīl wa ḥaqā’iq al-ta’wīl*.

Although not a strikingly original thinker, al-Nasafī remains a considerable authority in jurisprudence. His jurisprudential works as well as his creed have been the subject of commentaries by a number of jurists and theologians at least down to the eighteenth century, and the *Kanz al-daqa’iq* is known to have been used as a textbook in al-Azhar in the nineteenth century.

Abstract

Alsted was a foremost encyclopedist of the early seventeenth century. He provided both a complete presentation of all the subjects of philosophy (of which encyclopedia consisted) and a method to learn them. This method was an original synthesis of the dialectic of Petrus Ramus, the combinatorial art of memory of Raimond Lull and Giordano Bruno, and the method of presentation of philosophical disciplines of Bartholomäus Keckermann. Alsted's encyclopedism was intended as a remedy to the postlapsarian condition of man and was functional to the pedagogical reform pursued at the Academy of Herborn; this was, in turn, an essential part of the Calvinist state reform of the county of Nassau-Dillenburg. In theology, the importance of Alsted consists of having introduced millenarianism in the Reformed Europe, though his early, optimistic views on the imminent end of the world would change to pessimistic as a consequence of the Thirty Years' War.

Biography

Alsted was born in 1588 in Ballersbach, in the county of Nassau-Dillenburg. After having studied from 1599 at the Herborn Paedagogium, in

1602 he enrolled at the Herborn Academy, which was founded by Johann VI of Nassau-Dillenburg as part of a general reform of the state on a Calvinist basis, for which Ramus' logic served as pedagogical foundation (Menk 1981; Hotson 2000a, 15–24). In Herborn, Alsted studied under Johannes Piscator (who introduced Ramism in the Academy) and Mathias Martinius, another “semi-Ramist” (Hotson 2000a, 15, b, 17, 157). In 1606, he moved to University of Marburg, where he studied under Rudolph Goclenius the Elder and Gregor Schönfeld, by whom he was introduced to mnemotechnics (Hotson 2000a, 56–59), while in 1607, he moved to Basle to study under Amandus Polanus (a Philippo-Ramist). In 1609, he became a teacher at the Herborn Paedagogium, and in 1610, after a call from Martinius to the Academy of Bremen, he could become extraordinary professor of philosophy at the Academy of Herborn, while a call from the University of Frankfurt in 1615 allowed him to become ordinary professor. In 1619, he was delegate of Johann VII of Nassau at the Synod of Dordrecht and could then assume the third chair of theology, while in 1626, after the death of Piscator, he took the first chair. In these years he published his *Systema mnemonicum* (1610a), *Panacea philosophica* (1610b), and *Cursus philosophici encyclopaedia* (1620) and was teacher of Jan Amos Comenius (1611–1613). When the prosperity of Herborn was undermined by the events of the Thirty Years' War, in 1629 he accepted the offer of the Prince of Transylvania Gábor Bethlen of a professorship at the Academy of Alba Julia (Hungarian: Gyulafehérvár, Latin: Apulum). In Transylvania, Alsted had to establish the educational program of the local Calvinist ruling class (Keul 2009, 167–186). He died in Alba Julia in 1638, after having published his *Encyclopaedia septem tomis distincta* in 1630. (Hotson 2000a, 11–13).

Heritage and Rupture with the Tradition

The main aim of Alsted was to provide a presentation of all learning in philosophy, i.e., an

encyclopedia (Vasoli 2005, 21–29). This aim was theological in nature, since it served as remedy to the postlapsarian condition and to provide men with a complete knowledge (Hotson 2000a, 66–73). Moreover, it was functional to the reform of knowledge pursued in Herborn and would influence Comenius and Samuel Hartlib (Hotson 2011; Čížek 2012). For this aim, Alsted developed first a method of teaching and learning, which consists of memorization itself (Alsted 1609, 1610a). This method includes both the dialectic of Ramus (as a systematic ordering of notions) and the visual techniques of Bruno and Lull (Hotson 2000a, 39–46; Rossi 2006, 55–60, 97–138; Ong 2005, 163–165). Alsted's encyclopedic project is outlined in the *Panacea philosophica*, in which the unification of knowledge is made possible, on the one hand, by the discipline of *ars magna* (appropriated from Lull), which explains the notions common to all sciences and precedes ontology (Savini 2009); on the other hand, knowledge is made possible by *canonica*, which presents the general *praecognita* of philosophy and explicates the method of exposition of particular disciplines. This is inspired by Keckermann's logic and consists of *lexica*, *praecognita*, *systemata*, and *gymnasia*. *Lexica* and *praecognita* define the concepts and the nature of a discipline, *systemata* explicate its contents, and *gymnasia* are the exercise of the discipline itself (Hotson 2000a, 31–32). This method underpins the *Cursus philosophici encyclopaedia*, where Alsted follows a Ramist explanation of the contents of philosophy, providing general definitions and divisions by dichotomies (Hotson 2007, 149–273; Burton 2011, 53). In the *Cursus*, however, *ars magna* disappears (Savini 2009), as the whole encyclopedia is based on *archelogia* (concerning principles), *technologia* (on the properties, order and division of disciplines), *hexilogia* (on mental habits), and *canonica* (described also in Alsted 1612). Philosophical disciplines are divided, in the *Cursus*, into theoretical (on necessary things, including pneumatics, mathematics, and cosmology), practical (on contingent things, i.e., the subject of ethics and politics), and

poetic (concerning second notions, as rhetoric and mnemonics) (Vasoli 1975; Hotson 2000a, 70–71). This partition of philosophy is kept in his 1630 *Encyclopaedia*, which presents also a new combinatorial art, based on Lull's and Bruno's mnemotechnics (though deprived of their magical, i.e., summoning, components (Yates 2001)) and on the knowledge of *praecognita*, which makes possible the learning of the entire encyclopedia (Hotson 2000a, 163–181).

In theology, Alsted maintained Trinitarian positions. His arguments in favor of Trinity, such as that reality follows threefold structures, would be used by Leibniz against the Socinians (Antognazza and Hotson 1999; Hotson 2000b, 66–69). Moreover, along with Joseph Mede he was the founder of Reformed Millenarianism (Hotson 2000b, 1–30); in his *Methodus ss. theologiae* (1611) and in the *Cursus*, he provides a calculation of the end of the millennium (i.e., the time of the triumph of Christ) and of final judgment for 1694. This position was probably determined by the influence of the Hermetic tradition, envisaging a near regeneration of man. With the dramatic events of the Thirty Years' War, however, Alsted would foresee for this date only the beginning of the millennium (Alsted 1624, 1627; Hotson 2000b, 20–30, 94–120).

Al-Taftazānī

Born: 1322, Taftāzān, Khurāsān

Died: 1390, Samarqand

Jari Kaukua

Department of Social Sciences and Philosophy,
University of Jyväskylä/Academy of Finland,
Jyväskylä, Finland

Abstract

A famous fourteenth-century theologian and jurist, al-Taftāzānī is one of the last representatives of the high tide of Ash'arite philosophical theology.

Full Name

Full name Sa'd al-Dīn Mas'ūd ibn 'Umar ibn 'Abd Allāh; subsequently also quoted simply as al-'Allāma.

Biography

A theologian and jurist of considerable renown, al-Taftāzānī was born in 1322 in the village of Taftāzān in Khurāsān. Our knowledge of his education is scant. He is said to have been a student of al-Ījī but this is unlikely, al-Taftāzānī's open admiration of the older colleague notwithstanding. Similarly, he was probably not a student of Qutb al-Dīn al-Rāzī either, although he may well have benefited from the latter's philosophical erudition at a more mature stage of his career. At the apex of his career, al-Taftāzānī was attached to courts of the Kart dynasty and the Golden Horde and, after Timur's ascent to

power, was favorably received in his court at Samarqand. However, the veneration dwindled due to a scholarly rivalry against the much younger al-Jurjānī. Indeed, al-Taftāzānī is said to have been hastened toward his end in 1390 by a public defeat to the junior colleague in an exegetical debate.

In jurisprudence, al-Taftāzānī commented on sources from both Ḥanafite and Shāfi'ite schools. In theology, he mainly endorses the Ash'arite doctrine although in some question he leans toward Māturīdism. Apart from theology and law, he also wrote on logic (notably the popular epitome *Tahdhīb al-manṭiq wa al-kalām*), grammar, rhetoric, and Qur'ānic exegesis. His most substantial theological work is the manual *al-Maqāṣid* as well as his own commentary to it that bears the title *Maqāṣid al-maqāṣid*. He also wrote a commentary on Najm al-Dīn al-Nasafi's Māturīdite creed, which was widely used in teaching and later became the subject of several supercommentaries. Also noteworthy are his Persian commentary on the Qur'ān and a polemical treatise on Ibn 'Arabī's *Fuṣūṣ al-ḥikam*.

Al-Taftāzānī's theology latches on to the philosophically influenced tradition that leads by way of al-Ījī back to Fakhr al-Dīn al-Rāzī. In *al-Maqāṣid* and his own commentary, he describes his project in terms familiar from Avicennian philosophy; parallel in purpose and structure to theoretical philosophy, theology (*kalām*) differs from it by being practiced within a religious community and being informed by a number of revealed premises. Al-Taftāzānī also describes the structure of the science of theology in terms of the Platonic scheme of origination and return (*al-mabda' wa al-ma'ād*), following thereby the outlines of the philosophical curriculum. Moreover, the relation between theology and jurisprudence is described as analogous to that between theoretical and practical philosophy. Yet despite these similarities between the two ventures, al-Taftāzānī insists that in the end, theology is independent of philosophy. The same principles, albeit with some differences, are evident also in al-Taftāzānī's commentary on al-Nasafi's creed, which comes across as a strongly rationalistic interpretation of the central principles of

Islam. Although al-Taftāzānī was widely read by subsequent generations of scholars, it is an interesting fact that in light of the manuscript tradition, the particular combination of philosophical logic and *kalām* presented in *Tahdhīb al-manṭiq wa al-kalām* seems not to have been unanimously accepted; though the two parts were copied profusely, they seem to have led largely separate lives.

His vacillation between Ash‘arite and Māturīdite doctrine notwithstanding, al-Taftāzānī can be characterized as belonging to the mainstream of anti-Mu‘tazilite Sunnism. This stance is clearly reflected, for instance, in his strong critique of the doctrine of the creation of the Qur’ān or the denial of God’s omnipotence and omniscience in favor of human freedom. Together with al-Ījī, al-Taftāzānī is a representative of the most mature point of the comprehensive theological summa tradition; subsequent centuries devoted a considerably greater effort to commenting on the achievements of earlier generations.

Alumbrados

Jean Andrews

University of Nottingham, Nottingham, UK

Abstract

The term *alumbrados* was applied by the Inquisition or Holy Office in Spain to denote a group of devout people who developed a new form of devotional practice in the province of Guadalajara, to the west of Madrid, at the beginning of the sixteenth century. The name *alumbrado* comes from the verb *alumbrar*, to light up. The implication is that those who consider themselves *alumbrado* are lit up from within by their sense of spiritual intimacy with God. It was first invoked in an Edict of Faith proclaimed in Toledo on 23 September 1525 in response to the identification by the Holy Office of heresy among the Guadalajara worshippers, though they themselves would neither have used nor recognized the term *alumbrado*. The Edict of Faith listed the heretical practices associated with the so-called *alumbrados* and called for evidence and denunciations. The word, and the related term *alumbradismo*, would subsequently be used for almost two centuries within Roman Catholicism in Spain to describe groups of people suspected of engaging in a wide variety of heretical activities. Most of these had very little in common with the Guadalajara movement which can, with justification, be considered to be part of the gathering momentum towards reformation of Roman Catholic practices that crystallized in the one-time Augustinian, Martin Luther’s public declaration of his 95 *Theses* in 1517.

Impact and Legacy

From about 1512, in Guadalajara province in Spain, worshippers who became known as the *alumbrados* began to come together informally to develop new devotional practices, much of this in response to the mood for reform latent in the Catholic Church in the early sixteenth century. Most of the participants were *conversos* or New Christians, that is, those who had converted from Judaism prior to or in the wake of the Catholic Kings' edict of 1492 ordering Jews to leave Spain or convert to Catholicism. One of the reasons they may have resorted to establishing their own manner of intense devotional practice is that there were strict limits on the number of New Christians accepted into the major religious orders. Statutes were issued by the Spanish-founded Hieronymites in 1486, the Dominicans in 1496 and 1531, and the Franciscans in 1525 limiting numbers. A century later, the most significant Spanish-founded order, the Jesuits, under General Claudio Aguaviva, enacted a similar statute. In the Guadalajara area, those of a devout inclination who were New Christians but unable or unwilling to join conventional religious orders found themselves drawn to informal prayer groups called conventicles which were being set up in the early years of the new century. The approach of these conventicles was inspired by the growing interest in Erasmianism in Spain in the early sixteenth century, with its emphasis on the autonomy of the human subject; the direct study of the Bible as a text, unmediated by the devotional literature and books of sermons encouraged by the Catholic Church; and a form of meditation known amongst these worshippers as *dejamiento*, letting oneself go in contemplation and thus falling into the arms of God. This prayer method was very close to and partially based on the Franciscan practice of *recogimiento*, a more structured form of mental prayer which involved identifying appropriate times and places on which to meditate in silence on a particular aspect of Christian faith. *Dejamiento* was more adaptable and its adherents, the *dejados*, believed that one could abandon

oneself to the love of God anywhere and in the midst of any degree of activity. The *dejados* believed that the primary relationship of the contemplative was directly with God, not Jesus Christ, and that study of the Bible was the primary means of enlightenment. They had little time for involvement in good works as a means towards salvation in tandem with repentance. In a very Protestant and reformist sense, they saw much of this as distracting. To them, holy images, for example, used universally in Catholicism as devotional aids, were mere pieces of wood, unworthy of attention. They had a strong preference for mental or silent prayer and were unwilling to take part in formal church rituals. Their objective was to concentrate, in the purest possible way, on coming ever closer to God by means of *dejamiento* and autonomous study.

Isabel de la Cruz, a Franciscan tertiary in the towns of Pastrana and Cifuentes, a *beata* or middle or lower class laywoman devoted to living independently but as if she were a professed religious, is considered to be the leader of the movement. Pedro Ruiz de Alcaraz, an accountant to various noble households in Guadalajara, a married man with several children, and María de Cazalla, originally from Andalusia but married to a rich merchant from Guadalajara town, who had influential friends amongst the local aristocracy and at the nearby humanist-influenced university of Alcalá de Henares, were her two most noteworthy collaborators. All three were *conversos* or New Christians; all three had close ties to the Franciscans, an order then undergoing substantial reform, and whose mystical practices – those of the Friars Minor – were already seen as suspect by the Holy Office, and Cazalla moved in university circles, where in the 1520s the works of Erasmus, and for a limited period, those of Luther, were in free circulation, first in Latin, then in the vernacular. In the eyes of the Holy Office and those who would denounce them, their *converso* heritage left them open to the accusation of being Judaizers or crypto-Jews and their concentration on communion with God the Father and on reading the Bible, to accusations of Protestant heresy.

Indeed, the *dejados* proselytized freely only between 1512 and 1519. Two years after the posting of Luther's theses, the first denunciations were made to the Holy Office.

The movement was very much oriented towards the spirituality of lay people and women in particular, though there was also a significant number of friars and ordained priests among them. At its peak, the *dejados*' influence spread over an area encompassing contacts in Valladolid, the university city of Alcalá de Henares, and the estate of the Admiral of Castile, in Medina de Río seco. The vast majority of the *dejados* were New Christians and they represented a valid but, in their time, much distrusted and denigrated *converso* tradition of nonheretical Christian contemplation and practice within mainstream Spanish Catholicism. A series of trials took place over the next 20 years and the leaders of the movement were imprisoned and punished, though not severely. The Holy Office became much more interested in countering Lutheranism from the late 1520s onward. Throughout the sixteenth century, it frequently used the label *alumbrado* to attack those it suspected of Protestant tendencies, including some of the most luminous names in the history of the Spanish Catholic Church, such as Teresa of Avila, John of Avila, and Ignatius Loyola.

Two sets of trials took place in southwestern and southern Spain later in the century, in the province of Extremadura (Llerena) in the 1570s and in Seville in the 1620s. These trials targeted groups of mystics who professed to emulate, without much of the intellectual underpinning, the abandonment to God style of meditation espoused by Isabel de la Cruz and her disciples. Whereas the early *dejados* in general upheld the highest standards of propriety and earnestness in their meditational practice, going so far in their heyday as to condemn what they saw as the vulgar exhibitionism of some Franciscan *recogidos* all too willing to be witnessed in histrionic trance states, many of the *alumbrados* of Llerena were reportedly just as publicly demonstrative as the exhibitionist Franciscans. Most of those indicted were

either uneducated *beatas* or poorly-educated and doctrinally suspect priests who appeared to exercise minute control over how the women lived and displayed their acts of meditation, often presented as visionary transports, in public. Though the Edict of Faith issued in Llerena in 1574 listed a similar series of practices to those mentioned in the Toledo edict of 1525, there was a much greater focus on aspects of social behavior. However, in this instance, understanding of the degree of malpractice, especially sexual misconduct or episodes of demonic possession, engaged in by the *alumbrados* of Extremadura is entirely dependent on the trial transcripts and a significant proportion of the evidence for the 1579 trials was obtained through the use of torture.

The *auto da fe* which followed the trials of 1579 in Llerena saw nine men (priests) and ten women (*beatas*), tried and punished. The most severe female punishment was 400 lashes while several of the priests were sentenced to 4–6 years of service in the galleys. That these punishments were much harsher than those handed down in Toledo suggests a more aggressive approach to suspect popular mysticism on the part of the Holy Office. It also indicates the wholly malign influence of the Dominican Fray Alonso de la Fuente, a conspiracy theorist who not only orchestrated the first of the Llerena trials in 1575 but also went on to accuse the saintly preacher Fray Luis de Granada and the entire Jesuit order of *alumbradismo* and heresy in a letter written in 1576 to the Portuguese authorities. Though Fray Alonso was essentially discredited by the time of his death in 1592, the identification of *alumbradismo* with demonic possession and sexual misconduct had become entrenched. The 1623 Edict of Faith in Seville added fifteen new articles to those listed in Llerena in 1574, broadening the definition of *alumbradismo* so that it encompassed everything from atheism, witchcraft, and blasphemy to bigamy. An accusation of *alumbradismo* could thereby be made in relation to almost any conceivable social or religious transgression. In Seville, there was a new emphasis on the

eradication of imposture, that is, false mystics purporting to have visions of the persons of God or the saints, usually in public or in front of witnesses. The number of *beatas* and indeed enclosed nuns claiming visions of the divine grew exponentially under the reign of the devout Philip III (1599–1621) and the time had come to exercise some form of control. By 1623, the Holy Office was no longer concerned with fighting Protestantism, as it had been in 1525 in Guadalupe but in governing the religious and social conduct of Catholics in a nation which was by then almost wholly orthodox in terms of dogma and religious observance.

Accusations of *alumbradismo* would surface over the rest of the seventeenth century and beyond but by then the relationship between the errors denounced to the Holy Office and the ideals of Isabel de la Cruz and her followers in Guadalupe was nonexistent, and *alumbradismo* was a vague catch-all term for any form of deviation from the norm.

Amiroutzes, George

Born: ca. 1400, Trebizond

Died: After 1470, Constantinople

Sergei Mariev

Institute of Byzantine Studies, Byzantine Art History and Modern Greek Philology, Ludwig-Maximilian University of Munich, Munich, Germany

Abstract

George Amiroutzes was a Byzantine philosopher, theologian, and writer. During his lifetime he was considered the intellectual equal of Georgios Gemistos (Plethon) and Georgios (Gennadios) Scholarios. A native of Trebizond, he attended the Council of Ferrara/Florence in 1438/1439, where he supported the Unionist views. He led a diplomatic mission to Genoa in 1447 and held the title of *protovestiarios* and possibly of *megas logothetes*. After the fall of Trebizond in 1461, he was taken captive to Constantinople and, later, Adrianople but was soon invited by Mehmed II to stay at his court, where he continued his scholarly activity. His philosophical views can be reconstructed mainly on the basis of a short text preserved in cod. Plut. 87.17 in the Biblioteca Laurenziana in Florence and 15 philosophical treatises in Cod.96-37 (ff. 1r-90r) in the Archivo y Biblioteca Capitulares (Toledo). The short text in the Florentine manuscript refutes the view that Aristotle believed in a single common intellect for all men. The treatises preserved in the Toledo manuscript most probably reflect his activity as a teacher and do not constitute a comprehensive whole. One of the major themes running through them is the

attempt to refute Platonic philosophy. Most importantly, these treatises reveal the profound influence of Thomas Aquinas on A.

Biography

Amiroutzes' name, which is variously spelled in the sources (Ameroukes, Ameroutzes, Amiroukios), is a diminutive of the Turkish "emir." In the rubrics of his own writings, as well as in the writings of his contemporaries, he is frequently called "The Philosopher," which attests to the respect he enjoyed, probably in his native Trebizond but not in the competitive atmosphere of the Byzantine capital (Monfasani 2011). A. is known as a philosopher and theologian. He was born in Trebizond ca. 1400 to a wealthy and noble family and died in Constantinople after 1470. He possessed several vineyards in Trebizond (Beldiceanu and Beldiceanu-Steinherr 1981). Amiroutzes is first documented as an advisor to the Byzantine delegation to the Council of Ferrara-Florence, where he was a fervent supporter of the Union of the Churches (*ad indicem* in Laurent 1971). His pro-unionist stance is evidenced especially by his written statement on the subject of the *filioque* which he provided on 30 of May, 1439 (text in Jugie 1937). After his return to Trebizond, he supposedly repudiated his earlier views and gradually became an anti-Unionist (Karpov 2007). The main evidence adduced in support of this thesis is a letter to a certain Demetrios, Duke of Nauplion (text in Mohler 1920; Jugie 1939), but this letter has since been shown to be a forgery, fabricated most probably by George Koressios (Gill 1958). Nevertheless, the hypothesis concerning A.'s gradual drift toward anti-Unionist views after his return to Trebizond can also be substantiated from the fact that John Eugenikos (b. after 1394 d. after 1454/1455) sent him an epitaph of his brother, Mark of Ephesus (1394–1445), a staunch anti-Unionist, as well as from the fact that Amiroutzes was most probably a scribe of Cod. par. gr. 428 containing the *Mémoires* of Sylvester Syropoulos (Gamillscheg 1986), a supporter of

Mark of Ephesus. Between mid-April and the end of June 1447 (not between 1447 and 1449, see Karpov 1986, 1984), Amiroutzes was an envoy of John IV Komnenos of Trebizond (1429–1460) to Genoa, where he negotiated the marriage between one of the sons of John IV and a daughter of Lodovico di Campofregoso (Karpov 2007). This mission is mentioned in a letter of Georgios Scholarios to John IV (Scholarios IV, 453–454). Subsequently (ca. 1458–1461), he rose to the highest dignities of *protovestiaros* and perhaps *meas logothetes* at the court of John's successor David I Komnenos (1458–1461). In Turkish sources, he is known as *protovestiaros*, whereas he is called *logotheta* in the rubric of his *Dialogus de fide*. Trebizond fell into Turkish hands in August 1461. Amiroutzes was later accused of having treacherously incited David to surrender the city to the Ottomans (Bekker 1849; Lambros 1902). He may have even been related to Mahmoud Pasha (1451–1481), who led the attack on Trebizond, though this connection is disputed. There are only two sources that explicitly make depict A. a relative of Mahmoud Pasha. The *Ekthesis Chronike* (p. 26, 17–20) says that their mothers were daughters of Iagari (Trapp et al. 1976). The *Historia Politica* (p. 38, 2–3) says that A. was a nephew of Iagari, but without mentioning Mahmoud. After the surrender of Trebizond, Amiroutzes was sent as a hostage to Constantinople and later Adrianople, which provides some circumstantial evidence against the assumption of his kinship with Mahmoud Pasha. There is also a letter dated 11 December 1461 which A. sent to Bessarion telling of the surrender of Trebizond, which concludes with a plea for money to ransom his son Basil (text in Lampros 1914). A.'s fame as a philosopher must have reached Mehmed II a year or two after the surrender of Trebizond. A. was invited to stay at his court, where he continued his scholarly activity, discussing with the sultan about the Christian faith and preparing a map of the world based on Ptolemy. The literary fruit of these discussions is his *Dialogus de fide* which had been previously known only from a Latin translation. The Greek original has been recently discovered by

Monfasani in Cod. 96-37 in Toledo but remains unpublished. A short geographical work with the title *De his quae geographiae adesse debent*, based on Ptolemy, is another product of this period. It was translated into Latin by an unknown scholar and published by Johannes Werner (Vernerus) at Nuremberg in 1514. The only mention of A. by contemporary historians is found in Kritoboulos (Reinsch 1983), while the passage dedicated to A. in Laonikos Chalkokondyles' *Histories* (vol. II, p. 249, 3–24) is a later interpolation (Darkó 1922–1927, ed., vol. I, pp. xi–xii).

It is the view of modern scholarship (Frangedaki 1984; Argyriou and Lagarrigue 1987) that A.'s rather negative reputation in later sources is probably due to the hostility of the Constantinopolitan Patriarchate, on account of the fact that after A.'s death, his son Alexander/Skender Bey, in his capacity as Mehmed II's chief treasurer, confiscated church property. A.'s infamy is based on several charges. Besides the role he supposedly played during the siege of Trebizond and his alleged conversion to Islam, there is his alleged abuse of confidence which resulted in the execution of David Komnenos together with his three sons and his nephew in 1463 (Chalkokondyles, vol. II, p. 249, 3–24). To this should be added the accusation of bigamy. According to the *Ekthesis chronike* (p. 27, 15–28, 6), the daughter of Demetrios Asan, the widow of the last Duke of Athens, was brought to Adrianople. From the moment A. saw her, he decided that she should become his wife. His first wife was still alive and loudly objected to the divorce, so the Patriarch Ioasaph I refused to annul their marriage. A. resorted to the Turks and as a result both the patriarch and the *megas ekklesiarches* were severely mistreated: the former's beard was shaved and the latter's nose slit, after which the patriarch was deposed and A. succeeded in his romantic plans.

Although A. must have enjoyed significant fame as a philosopher, it is not known where he studied philosophy and if and where he taught. The widespread thesis that he had studied under John Argyropoulos (ca. 1393/1394–1487) was shown by Monfasani (2011) to be a mere

assumption of modern scholarship that finds no support in the extant sources. Given that A. was born ca. 1400, he must have belonged to the same generation of Aristotelian scholars as John Argyropoulos and Georgios Scholarios. It is possible that like them, he could have studied in Constantinople under John Chortasmenos (ca. 1370– before 1439) and Joseph Bryennios (ca. 1350–1430).

Our knowledge of his philosophical views derives chiefly from two texts, i.e., a short text (a single folio) in the fifteenth-century philosophical miscellany in Cod.Plut. 87.17 in the Biblioteca Laurenziana (Florence) and 15 short philosophical treatises identified by Monfasani in Cod. 96-37(ff. 1r-90r) in the Archivo y Biblioteca Capitulares (Toledo) and published in Monfasani (2011). The philosophical views expressed in these texts can be supplemented from some passages in his *Dialogus de fide*. The text in the Florence manuscript refutes the view that Aristotle believed in a single common intellect for all men. Macé and Van Deun (2009) are of the opinion that in this text, A. is refuting Averroes. Monfasani (2011) pointed out that A. could have just as easily been refuting the Greek commentators Alexander and Themistios. The 15 philosophical treatises in the Toledo manuscript cover a range of subjects and do not constitute a comprehensive or systematic work. The kind of geographical, semantic, and etymological information contained in them led Monfasani (2011) to the conclusion that they most probably reflect A.'s activities as a teacher. They could reflect basic themes in his teaching in Trebizond as early as 1430s and 1440s but might also be plausibly dated as late as A.'s stay in Constantinople in the 1460s. The first treatise is doxographical. A consistent theme running through the entire collection is anti-Platonism. Monfasani identified a procession of being and the First Cause as a major subject of the collection (I, II, IV, V, VI, VIII, IX, XIII, and IVX). Another is psychology (III, XI, and XII). Of the remaining three tractates, VII contains a critique of Plotinus' understanding of time; X is an analysis of happiness, and XV is a refutation of the theory of indivisible lines and magnitudes. More

importantly, the treatises reveal Thomistic influences. For instance, the argument in X, 18, 3, is based on the notion of *primum in aliquo genere*. XI and XII draw on Aquinas' doctrine of the unicity of the substantial form. In III, 8, 1, where A. argues that if the world were not eternal it would now not exist, Monfasani (2011) has discerned correspondences with Thomas Aquinas' famous third argument for the existence of God. In XIII, 7, 1–2, A. argues that the First Cause and not matter is ultimately responsible for the individuation of creatures, a view that has a striking parallel in the *Summa contra gentiles* II cc. 39–45, where Aquinas demonstrates that it is the First Cause and not matter that is responsible for the *distinctio rerum*. Monfasani (2011) also discovered parallels between V, 1, 9–11, and XIV, 2, 7–9, and Avicenna's doctrine of emanation, namely, that the First Intelligence necessarily produces the Second Intelligence, which in turn produces the Third Intelligence with the process continuing to the Tenth Intelligence. This doctrine is formulated in almost identical terms in the *Dialogus de fide* (f. 116v/23v), where A. makes explicit reference to a certain Apoales, which most probably conceals Abu 'Ali, the name Avicenna in its complete form Abū Alī al-Husain ibn Abdullā hībn Sīnā. If A. knew anything of Avicenna's doctrine, he must garnered this knowledge from Aquinas (SCG II c. 42), since Avicenna's works were not available in Greek.

Toulouse, Toulouse, France

Abstract

Jacques Amyot (Melun, October 30, 1513 – Auxerre, February 6, 1593), bishop of Auxerre from 1570, former tutor of Charles IX and Henry III, is one of the greatest translators of Greek Renaissance French (Blignières, 1968 [1852]) and after. If he thus provides especially the translation of *Les vies parallèles des hommes illustres* (1559) and that of *Les oeuvres morales et meslées* (1572) of the writer and Greek thinker Plutarch of Chaeronea (ca 45–ca 125), its activity of second author raises the question of its status as “philosopher.”

Biography

Jacques Amyot (Melun, October 30, 1513 – Auxerre, February 6, 1593), bishop of Auxerre from 1570, former tutor of Charles IX and Henry III, is one of the greatest translators of Greek Renaissance French (Blignières, 1968 [1852]) and after. If he thus provides especially the translation of *Les vies parallèles des hommes illustres* (1559) and that of *Les oeuvres morales et meslées* (1572) of the writer and Greek thinker Plutarch of Chaeronea (ca 45–ca 125), its activity of second author raises the question of its status as “philosopher.”

The working philologist he realizes from previous editions and manuscripts is especially visible in his annotations between 1565 and 1572 on its Greek copy of *Moralia*. It involves the superposition of two languages but also two cultures, Amyot wishing to popularize in French the Greek and Roman stories, and more broadly, the ancient *paideia*. So, while standing as close as possible to the “intent” of Plutarch on many thematic and corpus of him, he happens to introduce on them, deliberately or not, changes. Thus, he readily adds at the beginning or end of the texts details on lacks of the text he found, sometimes explicits enunciation of the situation, highlights the kind (“en forme de devis,” “déclamation”). Especially in the translation itself, some concepts are affected slides. To take some examples, the text “De la fatale destinée” of the *Oeuvres morales et meslées* moral reveals the difficulties that may arise in the spirit of the sixteenth century a world of intelligibility system derived from neo-Platonism, what seems to fit, in several stories of *Les vies*, a stronger presence shots of “chance,” few conform to the providentialism of the author first (Guerrier and Tourmon 2006). Moreover, in the animal texts of the *Oeuvres morales et meslées*, we read in the French greater presence of “prudence” attributed to animals, the term translated from both “*phronesis*” that “*Synesis*” of the original (Guerrier 2012a, 121–136).

This is even more important than the works of Amyot, republished several times, influence number of scholars, including Montaigne, making his praise in chapter II.4 of the *Essais*, informing his own book with Amyot’s work, taking among others in the *Apologie de Raimond Sebon* (II.12) the long meditation on time of “Que signifioit ce mot Ei,” in which man is immersed in contrast to God who is permanent (Pouilloux in Guerrier 2008, 293–308), and the rehabilitation of the animal which after him continue the Libertines and materialist philosophers (Guerrier 2007). However, it is noted that since 1581, then in the seventeenth century, Plutarch’s *Moralia* will be read in the “contrefaçons” (in the words of Aulotte 1965) obtained through the Protestant S. Goulart, versions of Amyot provided of index, punctuated by headlines, and including

summaries for each text, summary that guide the direction of the latter toward a forced Christianization, completing a move that had initiated the Fathers of the Church (Morlet in Guerrier and Payen 2005, 115–138).

In short, the role of “vector” or “runner” translator, of ancient “moral philosophy” as many of its doctrines (Platonism, Stoicism, Epicureanism), gives Amyot a special place in Renaissance philosophy, putting highlight how *imitatio* and mobilized scientist gestures can contribute to a story of ideas specifically humanist.

Anabaptism

Christopher Martinuzzi¹ and Emese Bálint²

¹History Department, DePaul University, Chicago, IL, USA

²Department of History and Civilization, European University Institute, Florence, Italy

Abstract

The term Anabaptism refers to the Christian movement that emerged in sixteenth-century Europe as a consequence of, and in parallel to, the Reformation. Originally, the name was used by the opponents of the movement because it disapproved of infant baptism and practiced baptism on believing adults. The German term “*Wiedertäufer*” was later changed to “*Täufer*” (Baptist), while in the English language scholarship, the term “Anabaptist” was kept because “Baptist” refers to an entirely different entity.

Heritage and Rupture with the Tradition

Despite strong persecution by both Catholics and Protestants, the Anabaptist movement spread across sixteenth-century Europe. From Switzerland to Germany, the Netherlands, Italy, Moravia, Poland, Hungary, Transylvania, and Britain, it finally reached North America in the

late seventeenth century. Apart from denying infant baptism, Anabaptism has often been associated with an apolitical attitude toward society that in most cases resolved in a refusal to swear oaths, in taking part in any form of public authority, and to bear arms.

Though most historians now agree with J.M. Stayer's polygenesis idea (Stayer 2002), e.g., multiple geographical points of origin of the movement, the debate over where and when the movement actually began is still an open one. The first adult "rebaptism" occurred in Zurich on January 21, 1525, when Conrad Grebel baptized George Blaurock, who in turn baptized other members of the Swiss Brethren (Estep et al. 1976). This event is considered to be the true starting point of the movement by the scholarship supporting the monogenesis theory (Bender 1950), only taking into account the practice of adult baptism and not considering the previous theological debate over the sacrament, rejecting those who did not adhere to the non-violent statements of the Swiss Brethren (such as the followers of Thomas Müntzer or the Münsterites).

The tendency in literature is to separate the early Saxon Reformation from the first Anabaptist movements in Switzerland and Austria. Recent studies (Balint and Martinuzzi 2017) have shown how the first Swiss and German Anabaptists had been influenced by the early Saxon reformers Andreas Bodenstein von Karlstadt and Müntzer in matters of authority, baptism and communalism, as well as on other more theological doctrines. Grebel's 1524 correspondence with Müntzer and Karlstadt shows clear evidence of this (Harder 1985; Matheson 1994). Müntzer's spiritualism influenced many German Anabaptists, such as Hans Denck, Hans Hut, and Melchior Rinck, who all created their own shades of Anabaptism. Even more so than Müntzer, the teachings of Karlstadt would not only influence members of the Swiss Brethren, such as Felix Mantz and Andreas Castelberg, but also the thought of Melchior Hoffman, and the apocalyptic leaders of the Münsterites, Jan Matthijs and Jan Beukels of Leiden. A profound change was brought about by

these figures, threatening the power of the secular rulers – traditional customs, laws, and practices – in the name of a higher authority.

Although it was seen, from the outside, as an aggregate movement, from the inside it never managed to unite in one single cohesive group. Bitter internal conflicts led to insurmountable divisions within the movement. These differences are related to political and eschatological matters. The first attempt to create doctrinal unity was with Michael Sattler's *Schleitheim Confession* (1527).

Innovative and Original Aspects

The community of goods was one of the few uniting elements: it was a project dear to the Swiss Brethren that would define it as *Liebeskommunismus* (sharing and caring); Müntzer had promoted the idea that *omnia sunt communia*; the Hutterites in Moravia promoted the restoration of the community of goods (The Hutterite Brethren 1987) while the Dutch Mennonites expressly rejected such radical interpretation of the Christian message. Other forms of Anabaptism included more spiritualist, apocalyptic, and even anti-Trinitarian views, as was the case of those that gathered at the Council of Venice of 1550.

Impact and Legacy

From 1539 Menno Simons, a former priest, became the leader of the Melchiorite remnants in the Habsburg Netherlands. Menno preached in favor of non-violence and separatism and created one of the most widespread forms of Anabaptism found today, the Mennonites. Under the leadership of Jakob Hutter, a hat maker from Tyrol, a new sect was coined (1533) that practiced the community of goods. Still keeping the original organizational form, the Hutterites are active today in North America. In the same way, the Amish trace their existence back to 1693, when Jakob Ammann revived the Swiss Anabaptist apolitical and separatist movement.

Anatomical Theater

► [Anatomy Theater](#)

Anatomy Theater

Cynthia Klestinec

Miami University-Ohio, Oxford, OH, USA

Abstract

Temporary and permanent anatomy theaters were used to provide public anatomy demonstrations for the academic community and, later, for a wider audience. They did not initially enhance the visual study of anatomy but rather cultivated the study of anatomy as a part of natural philosophy. Not only did they encourage interest in anatomy, they were related, as rituals, to communal expressions of sacrifice, redemption, and punishment. Variations in their use and significance depend partly on geographical location.

Synonyms

[Anatomical theater](#); [Dissection](#).

Heritage and Rupture with the Tradition

Although anatomical theaters have served as an emblem for the importance of seeing and observing nature during the so-called scientific revolution, they were initially used, like the lecture hall, for the presentation of knowledge, much of which was text-based, and for disputation (Carlino 1999). In its earliest instantiation, the anatomical theater presented anatomy “as a branch of natural philosophy” as Vesalius (following Galen) put it in *De humani corporis fabrica* (1543) (Klestinec 2011). In Padua, into the “glittering cradle” of the anatomical theater (built between 1594 and 1595), the famous anatomist, Fabricius of

Aquapendente, organized his study of anatomy around Galenic and Aristotelian categories of *historia*, *actio*, and *usus (utilitas)* and, inside the theater, presented an account of anatomical forms and functions that culminated in a teleological claim about final causes (Cunningham 1997; Siraishi 2004).

Innovative and Original Aspects

Spaces, however, tend to be heterogenous, and this was definitely true of the anatomical theater. The didactic function of the theater, for example, conflicted with its designation as a potentially theatrical space. Frequently stipulated in the statutes, the seating arrangement placed professors, administrators, and statesmen near the anatomist and the corpse rather than the students, who were sent to the upper tiers of the theater. Perhaps this was why, in Padua, students sometimes complained about their professor, Fabricius' public demonstrations, and admitted to a strong preference for private anatomies, especially those held by Paolo Galeotto and by Fabricius' successor, Giulio Casseri. In these private anatomical lessons, students acquired a more comprehensive understanding of human anatomy – for example, how the bones, or muscles, or vascular structures worked as a system – and sometimes had the chance to participate in the process of dissection. So different from the public anatomy demonstration, these experiences engaged the senses of sight and touch (as well as sound and smell) and suggest an origin for the kind of visual scrutiny that has come to be associated with the study of nature in fields such as botany and natural history during the so-called scientific revolution (Findlen 2006; Mandressi 2003).

Although the statutes for the annual anatomy demonstrations are fairly consistent across Italy – designating one to two corpses a year and requiring that the bodies be both ignoble (criminal) and foreign – local settings shaped the particular features of the experiences and practices inside the anatomical theater (e.g. Semenzato 1994). Public demonstrations of anatomy took place in January and February, cold months that slowed the process of decay in corpses and coincided with the break

between semesters. This was also the time of carnival, a celebration of excess that preceded Lent, a period of deprivation. Although the tradition of public anatomies in Padua developed as formal events and is better characterized as a contrast to carnival, public anatomies in Bologna overlapped considerably with the ritualized festivities of the carnival. By the seventeenth century, as Giovanna Ferrari has explained, spectators dressed in costumes began to appear in the anatomical theater (Ferrari 1987). As carnival rituals and anatomies began to overlap, the boundary between academic and local communities became newly porous. By contrast, in Padua, students complained when local men came to the theater; and, in one instance, they explained that the presence of “gaping craftsmen and vulgar men” had contaminated the theater and their ability to contemplate its “fruits” (Klestinec 2011).

Both the ritualized public demonstration of anatomy and the theater itself have played a key role in debates about punishment and the historical transformations of state power (and rise of absolutism). Influenced by Foucault's work on punishment, Jonathan Sawday has characterized the anatomist's complicity in the expansion of state power, describing the anatomist's dissection of the body as a continuation of the work of the executioner (Sawday 1995). In contrast, Katharine Park has characterized the cultural anxiety around dissection and the work of the anatomist as a result of upended burial (Park 1994, 2006). Developing the role of ritual, Andrea Carlino has drawn attention to the authorities and religious *confortatori* who sought to mediate the salvation of the criminal, up to the last moments of his life, thereby showing how public anatomies could inspire thoughts of sacrifice (the body) as well as redemption (the soul) (Carlino 1999). These cultural dimensions subtend the study of anatomy and its presentation inside the anatomical theater.

Impact and Legacy

The relationship between public anatomy demonstrations and private dissections changed over time. In the seventeenth century, the two

formats overlap, and the anatomical theater held demonstrations that emphasized not only the natural philosophical study of anatomy but also technical skill (*peritia*) associated with dissection, vivisection, and surgery (McVaugh 2006; Klestinec 2011). Eventually, the anatomical theater incorporated the display and discussion of anatomical pathologies (Cunningham 2010).

Anatomy, Renaissance

Frances M. Gage

Buffalo State – The State University of New York,
Buffalo, NY, USA

Abstract

Between the thirteenth and sixteenth centuries, the members of medical, lay, religious, university and artistic communities, often with various degrees of collaboration, observed the interior and exterior of human and animal bodies, utilizing a wide variety of practices. Between the fourteenth and sixteenth centuries when anatomy succeeded in establishing itself as a vital realm of medical training, the field maintained close ties to disparate philosophical traditions, from a foundation in Aristotelian inquiries into first principles in the earlier period, to increasing attention in the fifteenth and sixteenth to questions of form and function inspired by Galen. By the mid-to-late sixteenth century anatomists increasingly associated their field with natural philosophy and the study of natural phenomena and natural principles.

Heritage and Rupture with the Tradition

Scholars formerly construed Renaissance anatomy as a matter of public (and less often private) dissections undertaken by learned physicians and surgeons within universities, principally on the Italian peninsula, where the field saw its most important advances. Although important anatomical developments occurred within this context, most notably in the period leading up to, including and immediately following Andreas Vesalius, this narrow construal of anatomy resulted from the erroneous assumption that the Catholic Church prohibited dissection (Carlino 1999; Mandressi 2003; Park 1994, 2006). It was long assumed that motivating the substantial religious and civic oversight of the location, mode, and number of dissections advanced a judicial agenda in which executed criminals, whose bodies remained a

primary source for university anatomists, were punished into the afterlife (Mandressi 2003; Park 1994, 2006).

It is now generally acknowledged, however, that the practices associated with Renaissance anatomy were considerably more varied than this picture suggested. Dissection was not prohibited by the Church, although attitudes toward it remained ambivalent at best and many anatomists openly acknowledged that it would provoke feelings of repugnance in all but the most resolute of individuals (Park 1994, 2006; Ferrari 1996; Carlino 1999; Mandressi 2003). The opening of the body during autopsy and embalming considerably predated university dissections, actually originating within lay and religious contexts (Park 1994, 2006). Already in the twelfth century, cadavers were cut open as part of funeral rites; autopsies and embalming were carried out by members of male and female religious orders, sometimes in consultation with physicians (Park 1994, 2006). The early fourteenth century witnessed an increase in documented autopsies, particularly those associated with individuals of saintly conduct, though lay men and women likewise requested autopsies of family members in the hopes of preventing hereditary illnesses and conditions (Park 2006). The early fourteenth century likewise saw the emergence of university dissections. The anatomist Mondino de' Liuzzi, author of what was to become a widely utilized and heavily Galenic textbook, his *Anatomia* of 1316, alluded to dissection. Spurred in part by medical humanism and the discovery and publication of ancient texts, particularly those of Galen (such as his *De usu partium*), dissections increased both within and especially outside university contexts up through the sixteenth century (Park 1994; French 1999; Mandressi 2003). For the relative scarcity of suitable cadavers, university dissections remained numerically inferior by far to private dissections undertaken for the sake of research or autopsies requested at the behest of private citizens or religious authorities (Park 1994). In the later period, vivisection was also revived on the model of the ancients for the sake of understanding the specific functions of parts (Cunningham 1997; French 1999; Shotwell 2013).

The formal conventions that university dissections followed would see significant modifications in the Vesalian era. In the fifteenth century, university lecturers sat in a raised pulpit, reading from an authoritative anatomical text such as Mondino or Galen. Below the lecturer and next to a cadaver laid out on a table, a demonstrator pointed out the relevant features in response to the textual passages, while a dissector, typically a surgeon or barber-surgeon, cut open the body (Carlino 1999; Cunningham 2010). This tripartite practice reflected the relative nobility of and distinct professions involved. The lecturer, a physician of theoretical medicine, was regarded as the most noble; he concerned himself with Aristotelian first principles (Ferrari 1996; French 1999; Cook 2006). The surgeon, whose expertise related to particular bodies, occupied a lesser rank. A radical shift occurred when Vesalius dispensed with the barbers and demonstrators, carrying out all three roles of lecturer, demonstrator, and dissector. Vesalius regarded direct observation and handling of the body as crucial. In this regard, Vesalius hewed to Galenic principles and methods, which remained the foundation of his practice, despite his criticism of Galen's particular errors (Cunningham 1997; Mandressi 2003; Park 2006).

Hospitals or civic authorities typically supplied cadavers for university dissections, though they might also be acquired, as Vesalius attested, through grave-robbing or other illicit means. Several considerations motivated the preference for bodies of condemned criminals: those subject to hanging remained more completely intact and presumably free of diseases that might alter the morphology of organs. Furthermore anatomists risked few challenges from family members of individuals hailing from distant locations or belonging to lowly social groups (Carlino 1999; Park 1994, 2006; Mandressi 2003).

University faculties in anatomy undertook their annual dissections (typically of one or two cadavers) during carnival season, thereby reaffirming the spectacular nature of these events (Cunningham 2010; Klestinec 2011). The crowd might number in the hundreds at these events and they frequently drew not only students and the

curious but also prominent members of a community (Carlino 1999; Cunningham 2010). The early sixteenth century saw the conception of the first anatomical theater by Alessandro Benedetti, and soon thereafter temporary and subsequently permanent anatomy theaters were built, reinforcing the theatrical, ritualistic nature of the public university dissection (Ferrari 1996; French 1999; Park 2006; Cunningham 2010; Klestinec 2011). These settings were not conducive to easy observation nor did they tend to further research, but they reinforced students' memories of authoritative texts and existing anatomical knowledge (Carlino 1999; Cunningham 2010; Klestinec 2011; Laurenza 2012). Public dissections likewise underscored anatomy's ties to philosophy; they focused on broad questions pertaining to the structure, design, and purpose of parts of the body, upholding Galenic teleology, and they presented dissection as a *memento mori* (French 1999; Klestinec 2011; Siraisi 1997). The sixteenth century witnessed an increase in public dissections in which bodies were prepared beforehand and parts presented for display (Klestinec 2011). Private dissections are widely attested, though less-well documented and inherently more difficult to reconstruct. Their small size promised students more direct access to touching and observing the body and thus more opportunity for the acquisition of manual expertise and the making of new discoveries (Klestinec 2011). By the end of the sixteenth, anatomists increasingly approached their subject as natural philosophers seeking to understand natural phenomena for their own sake (Cook 2006; Klestinec 2011). Over the course of three centuries, academic anatomists succeeded in establishing their field as a fundamental arm of medical education (Park 2006).

Renaissance artists likewise distinguished themselves for their contributions to anatomy, not only in the realm of illustration but also in their discovery of the structure and functioning of the body. Already in the early Renaissance artists demonstrated a more advanced understanding of the bone structure and musculature than their medical counterparts. By the end of the fifteenth century, Leonardo da Vinci and Michelangelo Buonarroti undertook anatomical research of

their own, each later intending to produce a treatise on anatomy, though their plans were never realized (Laurenza 2012). Each also collaborated with well-known university anatomists. In spite of these considerable exchanges, Renaissance anatomists and artist-anatomists generally agreed that the latter concentrated upon what they termed "surface anatomy," ignoring the minutiae that might interest medical professionals (Laurenza 2012). Nevertheless physicians, anatomists, and artists shared many similar philosophical interests, particularly in a canonical or normative body, in questions of corporeal structure, order, symmetry, proportion, and beauty (Mandressi 2003; Klestinec 2011). Both groups were united in their investigations into form's relation to function and the use and movement of body parts (Mandressi 2003).

Andreas Tiraquellus

► [Tiraqueau, André](#)

Angelikoudes, Callistos

Born/Died: Melenikon 14th Century

Michail Mantzanas
Ecclesiastical Academy of Athens, Athens,
Greece

Abstract

Holy Father and saint, author of numerous unconventional works. However, there is little information about his life, apart from the fact that he practiced the monastic life at a monastery in Meleniko and wrote his works during the second half of the fourteenth century. Callistos was primarily concerned with Thomas Aquinas' scholastic philosophy and theology, which he tried to oppose.

Biography

Callistos lived and flourished near Meleniko in Eastern Macedonia, during the second half of the fourteenth century. Living in a period when Hesychasm was glorious in the Byzantine

Empire, he himself was so deeply influenced by it that he was considered one of the most important representatives of the Hesychast mysticism. Being a supporter of Hesychasm, he was favored by the Serbian despot John Oungliesa (†1371). As mentioned in a sigillum – an official decree of Patriarch Philotheos Kokkinos (1300–1374) – Callistos was a monk at 1371, and he was highly appreciated by religious and political figures of his time.

Innovative and Original Aspects

Callistos is the author of a vast amount of works on neptic theology, which includes 30 chapters and has not yet been published, except for a small excerpt, attributed to him, which was published in *Patrologia Graeca's* volume 147. Neptic theology is a religious movement focused on ascetic experience, which flourished during the thirteenth and fourteenth century in Mount Athos and its spiritual practice relied on endless (uninterrupted) praying and spiritual work, sincere repentance, and internal purification. Callistos' treatise *Trianta Logoi isihastikis parakliseos* is, most probably, the second part of another work which bears the title called *Isihastiki Agogi* but has not survived in its entirety. Callistos Angelikoudes' literary skills are evident mainly in his polemical writing *Peri tis outo kaloumenis siggrafis Thoma tou Akinatou kata Ellinon*, which criticizes on the basis of rather weak arguments of Thomas Aquinas' *Summa contra Gentiles*, which was translated in Greek by Demetrios Cydones. Although, Alain de Libera thought of Angelikoudes arguments' as sound and convincing. Aquinas' *Summa contra Gentiles*, which reflected the efflorescence of Latin Aristotelian Christianity, enjoyed broad circulation in the Byzantine world thanks to Demetrios Cydones' translation. The importance of philosophical realism on the development of Christian theology was doubted in this controversial work of Callistos Angelikoudes. Namely, the general outline of the conflict between Hesychasts and Byzantine Thomists was reflected in Angelikoudes work. Demetrios Cydones and the Byzantine Thomists

were Callistos' targets. Callistos refuted Aquinas' philosophical realism arguing that, from a moral point of view, theological truth is based on consciousness, rather than on intellect and epistemology. According to Callistos, human intelligence can perceive, besides God, humanity in its totality.

Impact and Legacy

Callistos sought not only to highlight the early dispute between intellectualism, giving prominence to rational thought, and mysticism which promoted experience and religion but also to dissociate the Eastern Orthodox tradition from the Western scholastic one. He dealt with issues related to spiritual experience and the theory of the divine, as well as the individual experience of the divine through the divine eros, spiritual and inner prayer, and divine radiance. Callistos held that beatitude (theoptia) is not a theoretical point of view, as suggested by Thomas Aquinas; on the contrary, it is the vivid experience of the uncreated light. Moreover, according to Callistos, it is not possible for human intelligence to conceive of the divine essence through an analogical relationship with it. In his short treatise *Peri isihastikis trivis*, he praises spiritual prayer, its spiritual illumination, and elaborates on the conditions which allow the Hesychast to be united with God. In his *Eklogi apo ton agion Pateron Peri prosefhis kai prososis*, he suggests that the heart should be shielded with caution, rigor, and vigilance, in order to avoid the traps of evil lurking throughout its struggle to reach its destination, that is, eternal life. Callistos also emphasizes the inherent autonomy of religious experience as opposed to scholastic intellectualism and challenges the scholastic method of seeking the divine truth by reflection and syllogisms.

Angels and Demons in the Renaissance

Mattia Geretto

Ca'Foscari University of Venice, Venice, Italy

Abstract

Angels and demons belong to the Renaissance period in many ways: from philosophy to theology, from medicine to cosmology, to art and literature, these figures appeared regularly enough to make them an essential element of this age. While Protestant theology abolished the cult of the angels and reshaped the entire angelological vision of Pseudo-Dionysius, on the Catholic side, prayers, festivals, and meditations dedicated to angels gradually increased. As for the philosophical reflection on angels/demons, there were two different lines of thought. On the one hand, there was a strong continuity with the angelology/demonology of medieval Scholasticism, made up of all those thinkers who expounded and commented on the thought of the great masters of the past, adding in some cases their own positions (see above all the case of Suarez). On the other hand, decidedly new perspectives emerged with the development of hermetic, magical, and cabalistic thought, thanks also to the immense work of the translation of the classics on Hermeticism and Neoplatonism undertaken

by Marsilio Ficino. This second line of thought (with philosophers such as Pico, Reuchlin, Trithemius, Agrippa, Campanella, Bruno – to name just a few) went beyond the simple description or theoretical treatment of angelological issues. On the basis of magical-cabalistic knowledge, the magician-philosopher claimed that interaction with these beings was possible. Such claims have always been seen with great suspicion by the Church, both Catholic and Protestant. Renaissance art and literature in turn incorporated and reinterpreted these beings, sometimes in an original way.

Heritage and Terminological Clarifications

Angels and demons were an integral aspect of the Renaissance worldview. Although the de-animations of the heavens slowly emerged in the Middle Ages, in the cosmological vision that prevailed before heliocentrism took hold, angels were still often depicted as intelligent beings that governed the celestial spheres, which in turn were thought to produce ineffable harmony through reciprocal movement. The words addressed by Lorenzo to Jessica in Shakespeare's *The Merchant of Venice* sum up poetically this vision: "Sit, Jessica. Look how the floor of heaven/ Is thick inlaid with patens of bright gold. / There's not the smallest orb which thou beholdest / But in his motion like an angel sings, / Still quiring to the young-eyed cherubins; / Such harmony is in immortal souls, / But whilst this muddy vesture of decay / Doth grossly close it in, we cannot hear it" (V.1).

In the context of a philosophical interpretation linked to the Biblical-Christian concept of creation and on the basis of the authority of the Church Fathers and great doctors of Scholasticism, the Renaissance also acknowledged angels and demons as representing beings of another nature compared to humans, positioned between God and humans in the Great Chain of Being. Similarly, in general the Renaissance conception was that angels and demons opposed each other

invisibly, since, they were thought to be the legions of celestial forces faithful to God and on the other hand were a group of beings determined to destroy and kill, deliberately opposing God.

From cosmology to poetic literature, to art and from theology and philosophy to the practice of magic, these special, rational creatures, different from humans, regularly appear in a precise role that clearly reveals an aspect that is essential to the philosophical and theological sentiment of that period. It could be said that the Renaissance was the last period in which, in philosophy, prior to the advent of the scientific revolution, the Enlightenment, and the relentless process of secularization, angels and demons enjoyed peacefully the right of citizenship, having their natural place without division in a hierarchical view of the cosmos.

Rather complex is the fact that between these two forces, some authors (albeit rarely) mention entities that take no sides but are neutral, carefully referred to as "spirits" or "genii." Such beings vaguely recall those angels that according to Dante (*Inf.*, 3, 37–42) were neutral and then condemned to remain in the vestibule of hell. Again, for instance, in *The Tempest* the character of Ariel is introduced simply as "an airy spirit," and perhaps Shakespeare intentionally created an aura of ambiguity around him.

Thus, angels and demons, as a result of the abovementioned doctrine of creation, cannot but be considered together. Nevertheless, in this case it will be more practical to deal with them in two, separate sections: without wishing to clearly separate the two fields or the authors dealt with therein, the expression "angelology" for angels and "demonology" for demons will be adopted. However, it should be remembered that, technically speaking, angelology, the discipline concerning the nature of angels, also includes the study of demons that are considered *fallen angels* (see the expression *Angelus malus*, *idest Diabolus* in St. Thomas Aquinas). Indeed, the main treatises on angelology in the sixteenth and early seventeenth centuries frequently included a section devoted to damned angels (see the prime examples of the treatises by Suarez [1856](#) and Pétau [1868](#)). Conversely, the term "daemon" technically

includes all kinds of *spirits*, even “good demons.” For instance, in Marsilio Ficino the terms “bonus daemon” and “angelus” are considered synonyms. However, in the Christian European tradition, the name “demon” gradually became associated with an evil, fallen angel (“cacodaemon”).

The Renaissance inherited and reinterpreted an “angelological” and “demonological” tradition that was deeply rooted in the philosophical-theological, Greek and Roman, patristic and scholastic traditions, in Talmudic-rabbinic literature, in the Cabbala, and in the Gnostic and magical-theurgical traditions in late antiquity. Thus, it is a vast, complex subject, of which only a few basic indications are provided here, taking into consideration three key fields in both the “angelological” and “demonological” sections: (1) Philosophy and Theology, (2) Impact and Legacy (with specific reference to devotion and demonic magic), and (3) History of Art and Literature.

Angelology

Philosophy and Theology

In order to assess the extent of continuity or interruption between angelological treatises written by the great doctors in the Middle Ages and Renaissance thought, the type of philosophical work and literary genre should be first kept in mind. In this way, it is clear that the greatest degree of continuity with the past may be identified in the authors who methodologically followed in the footsteps of the scholastic tradition, such as all the foremost expounders and commentators of St. Thomas Aquinas (Cajetan, Banez, Molina, Alvarez, Pesantius, John of St. Thomas, and others). The Jesuit priest Francisco Suarez is also included in the scholastic tradition with his *De Angelis* (1620), which provides an extensive summary of angelology (and demonology) skillfully steering a middle course between the positions of Aquinas and Duns Scotus, upholding one or the other alternatively, or else in some cases providing his own original contributions: see, for example, his position on the relationship between the angels with bodies and

space; on the theory of angelic knowledge, or else concerning events in the period of time that is impossible to determine through human parameters, which goes from the first moment of the creation of angels, to their elevation, trial, and downfall for some angels; or on the preservation of their relationship with God for others. Again, following Jesuit scholastic tradition but with some original traits, within angelology there is an important development with *De Angelis* (1644) by Denis Pétau (Petavius), whose treatise stands out compared to past studies, adopting a clear, historical approach and specific sensitivity to the position of the Church Fathers.

However, it is a different matter with reference to the production of the most important humanists of the fifteenth and sixteenth centuries, as this often means making an overall appraisal of their *Weltanschauung* and taking into consideration the disruptive Protestant Reformation. In general, it can be said that humanism, as can be seen in such authors as Marsilio Ficino and Giovanni Pico della Mirandola, is less interested in the intricate scholastic issues on the nature of angels and considers the angel as being able to better enhance human potential and hence the dignity of humans. For example, Marsilio Ficino interprets the human soul as a *copula mundi*, the link between the higher degrees of reality (God and angels) and the lower degrees (quality and body). In *Oratio De Hominis Dignitate* (1486), Pico della Mirandola speaks of Seraphim, Cherubim, and Thrones as “the bond which unites the highest minds, the Palladian order which presides over contemplative philosophy.” Nevertheless, in his famous *Oratio*, Pico also says that because of the special privilege of free will accorded to humans by God, nothing may stop them from elevating themselves to perfection, to rival the dignity and glory of the angels themselves.

What has been said so far in no way diminishes the attention paid by great humanists like Ficino and Pico to previous important scholars. For example, Ficino clearly acknowledges the importance of *De Hierarchia Coelestis* by Pseudo-Dionysius the Areopagite in such works as *De christiana religione*, *De Raptu Pauli* and *Theologia Platonica*. Other writings equally

bearing copious scholarly reference to the Church Fathers and scholastic doctors on the subject of angels are such texts as *Theses Nongentae* by Pico (e.g., see some of the theses drawn from Thomas Aquinas, Henry of Ghent, and Egidius Romanus; in the “Conclusiones paradoxae numero XVII secundum propriam opinionem,” see thesis 8, which aims to reconcile Aquinas and Duns Scotus on the question “If angels could yearn simply to be equal to God”).

A further new concept introduced by some humanistic Renaissance considerations is a sort of “step ahead” in the potential *relation* with angels, made possible for some through magic and the Cabbala, whose texts are interpreted by Pico and Reuchlin in the light of Christian dogmas. Pico discusses the heavens in the section of his *Heptaplus* (1489), entitled “De mundo angelico et invisibili.” A contemporary of Pico, the German humanist Johannes Reuchlin in *De Arte Cabalistica* (1517), argues that the Cabalist is equipped to understand the intricate conversation of angels. He also claims that he is a friend of theirs and thanks to this friendship is sometimes able to perform those wonderful deeds that people call miracles through his knowledge of the correct form of divine names (Book I, *sub fine*).

The Cabbalistic-Christian tradition would pave the way to a form of mystical-theosophical angelology, and one of the greatest exponents of this was Jakob Böhme. In works like *Morgenröte im Aufgang* (1612) or *De tribus principiis* (1619), Böhme believed that the mysteries of God and creation may be understood by humans in the chapters dedicated to angels in which he also speaks of fallen angels. The final outcome of this elevation is the glorification of humans above the hosts of angels themselves. This “superiority” may also be found in the mystical works of Johannes Scheffler, better known under the pseudonym of Angelus Silesius, whose most famous work written in verse, *Cherubinischer Wandersmann* (1657), contains echoes of themes found in Rhine-Flemish mysticism. As regards treatises, from a strictly terminological point of view, in the German area between the sixteenth and seventeenth centuries, the term “angelography” became widespread. For

example, see the work by Otto Casmann, *Angelographia* (1597).

Impact and Legacy: Devotion and Religious Piety

In addition to strictly academic systematic treatises, in the late scholastic period flourished a wealth of treatises that were less erudite and more mainstream, written for pastoral purposes to provide spiritual guidance and worship, especially as regards the guardian angel. See, for example, the *Llibre dels Angels* (1392) by the Franciscan Catalan writer, Francesc Eiximenis. Even more clearly in the popular pastoral tradition were the successful sermons, *Prediche volgari* (1427), held in the main square of Siena by the Franciscan friar, St. Bernardino, which contain numerous references to angels. One notable aspect of this preacher is his conception of human nature as being superior to the nine choirs of angels and the incorporation of Origen’s idea that humans substitute fallen angels.

As regards the spirit of the Counter-Reformation, according to the founder of the Society of Jesus, Ignatius Loyola, angels are objects of contemplation and reflection in his *Exercitia Spiritualia* (1548) (see, e.g., the Second Week, First Day, First Contemplation [§§ 106–108], or else the *Rules of Discernment of the Spirit* [§ 328ff.]). Designed to uplift the soul is also the dramatic and “spectacular” *Meditations on Hell* (First Week, Meditation V [§§ 65ff.]). Likewise, during the spiritually revitalized and dynamic period of post-Tridentine Catholicism, with the specific intent to provide meditation and uplift the soul is the reference to angels in the mystical works by St. John of the Cross (*Dark Night of the Soul*, *Living Flame of Love*, *Spiritual Canticle A*, *Spiritual Canticle B*, and *Ascent of Mount Carmel*). In the works’ powerful theological lyricism, it is interesting to note that although the angels are depicted as belonging to a higher level of reality, they are also considered wholly at the service of humans, as a model and end to which the soul could be lifted through prayer, toward complete self-transcendence.

However, as regards Protestantism, in general the cult of angels was not permitted, together with

the worship of saints and the Virgin Mary. Indeed, it was considered a sort of offense against God's sole majesty. Luther on this point was adamant and even more so Calvin, and the whole body of teaching regarding the existence and the role of angels in creation was summarized in a few, essential points. Consequently, hitherto highly esteemed works such as *On the Celestial Hierarchy* by Pseudo-Dionysius became less and less relevant: Calvin without hesitation speaks of "idle talk," considering this type of erudition superficial speculations that are best set aside, without claiming to wish to know what the scriptures did not allow us to know (*Institution de la religion chrétien*, I, 14, 4). Angels make no appearance in Calvin's first French catechism (*Instruction et confession de foy dont on use en l'église de Genève* – 1537), although Satan, the devil, and hell are mentioned in the work (see Part IV, second and sixth question). Nevertheless, such general reticence to discuss angelology did not prevent systematic works from being established in Protestant circles, such as *De operibus Dei* (1591) by Girolamo Zanchi (Zanchius), or works containing specific reference to guardian angels, such as the short work by Johannes Rivius, *De familiari cuiusque genio, seu praesidio Angelico libellus* (1537), or *De angelis angelicoque hominum praesidio* (1595) by Johannes Stuckius. Moreover, Martin Luther in the final part of *Der kleine Katechismus* (1529) inserted a prayer with specific reference to the guardian angel ("[...] Dein heiliger Engel sei mit mir/das der böse Feind keine Macht an mir finde. Amen" – see "Wie ein Hausvater sein Gesinde lehren soll, morgens und abends sich zu segnen").

The Catholic Reformation also supported a brief doctrinal approach in relation to the issue of the existence and role of angels, as evident in the short paragraphs in the *Catechismus Romanus* (1566): the spiritual world and angels were created by God from nothing; all the angels, including those which later became apostates, were granted God's grace and good will (see Pars I, Art. I, "Creantur Angeli et quales"). With this assertion the *Catechismus Romanus*, apart from adopting St. Augustine's thought (*De Civitate Dei*, XII, 9), reconfirmed the precepts of the

Constitutio "Firmiter" of the Fourth Council of the Lateran (1215), subsequently adding only a brief mention of the subject of science and the power of angels (grounded in fundamental scriptural reference). The abovementioned "Art. I" concludes by asserting the banishment of sinner angels from the sublime realm and being "cast into the darkest prison of the earth, where they are eternally punished for their pride" (Ibidem). In the section where the cult of saints is legitimized (Pars III, Primum Praeceptum Decalogi, "*Cultus Sanctorum huic praecepto non repugnat*"), also confirmed is the legitimacy of worshipping the angelic spirits "whose work God uses to support not only his Church but the whole universe." Furthermore, their role as guardians is also mentioned. The precious service of guardian angels is briefly discussed at the beginning of the conclusion of the work (see Pars IV, Pater Noster Qui Es In Caelis, "*Orationis Dominicae proemium*"). The last part also contains a brief description of Satan and the attack of demons (Pars IV, Sexta Petitio).

The Catholic Church during the liturgical year authorized special feasts dedicated to guardian angels and to the three archangels, Michael, Gabriel, and Raphael. Still on the subject of Catholicism, in the sixteenth century, litanies to St. Michael and to guardian angels became common. Such forms of popular devotion were often frowned upon by the Catholic Church, to the point of provoking open condemnation of those forms of devotion that used names or invocations that had not been expressly approved by the Church.

History of Art and Literature

Angelic iconography in the Western Christian tradition emerged with increasingly precise characteristics from the fourth century AD onward: white robes, nimbus, halo, and wings. Subsequently, the *sphaira*/globe (usually in the left hand) and the rod/staff/lance/sword (usually in the right hand) were added, and other features gradually appeared, such as ribbons, crowns, *clavi*/stoles, *pallium*, multicolored wings, sumptuous apparel, or armor. All this to express as precisely as possible the dignity and authority of the different angelic orders. The success of Pseudo-Dionysius the Areopagite's work on

angelic hierarchy promoted the dissemination of further symbols to define this, such as the throne, balance, and chain. In the second half of the fourteenth century, Guariento di Arpo bequeathed a rich and complex synthesis of angelic iconography in Padua, ruled by the Carraresi family at that time. Thus, once again the Renaissance came into a rich, cultural, and artistic heritage that was reinterpreted, extended, and to a certain degree revolutionized. The angels appear as fundamental figures in the depiction of characteristic evangelical themes: *The Annunciation* (to cite only a few of these famous examples, see Leonardo da Vinci (c. 1474–1475), Uffizi Gallery; Botticelli (1489–1490), *Cestello Annunciation*, Uffizi Gallery; Raphael (1502–1504), *Oddi Altarpiece*, Vatican Pinacoteca); *The Nativity* (Ghirlandaio (second half of the fifteenth century), Vatican Pinacoteca); *Christ in the Garden of Gethsemane* (Veronese (1570), Milan, Brera Pinacoteca); and *Resurrection of Christ and Women at the Tomb* (Beato Angelico (1438–1443), Florence, Museum of San Marco). Other typical themes are that of the guardian angel, symbolically represented through episodes from the *Book of Tobit*, which narrates the story of Tobias on a journey accompanied by the archangel Raphael (see, e.g., Piero del Pollaiuolo (1465–1470), Turin, Sabauda Gallery, and Girolamo Savoldo (c. 1527), Rome, Borghese Gallery).

Francesco Botticini (c. 1470) and Domenico di Michelino (c. 1460–1470) with two famous paintings exhibited in Florence, at the Uffizi Gallery and the Accademia Gallery, respectively, approach the theme through an alternative account, in which Tobias is accompanied by the archangels Michael, Raphael, and Gabriel, depicted with features that make them instantly recognizable: Michael is dressed as a soldier and Raphael holds a jar of ointment and Gabriel a lily. The Virgin Mary and the *Book of Revelations* are other preeminent subjects that inspired Renaissance artists who focused on angelic themes. *The Virgin of the Rocks* by Leonardo (1483–1486 – Louvre Museum) reveals the persistence of apocryphal or esoteric literature: in the rich, complex symbolism of the painting (that is probably drawn from the gospels on the infancy of

Jesus), there is much speculation about the identity of the angel. While some scholars believe the figure represents Gabriel, others speculate that the angel depicted by Leonardo is Uriel (an angel whose worship was severely prohibited in two councils, in Rome in 745 and in Aachen in 789). The *Book of Revelations*, whose basic theme is the Last Judgement, inspired the numerous references to angels in the Sistine Chapel by Michelangelo (1533–1541), where it is possible to observe some remarkable innovations. Indeed, Michelangelo's angels are completely humanized, almost enhancing an underlying unity that has been achieved between humans and angels: their wings have disappeared as well as all typical features associated with their vestments (however, it should be noted that the depiction of angels in the early centuries of Christianity was already wingless).

Another significant feature in Renaissance art is the gradual dissemination of the depiction of angels as little boys: cherubs and cupids, possibly the most famous examples being the cherubs in the *Sistine Madonna* by Raphael (c. 1513 – Dresden, Gemäldegalerie Alte Meister) or the *Musician Angel* by Rosso Fiorentino (1521 – Uffizi Gallery). In the *Ecstasy of Saint Teresa* by Bernini (c. 1645), the young angel is no longer distinguishable from the Cupid of antiquity: the nascent Baroque bursts out vigorously in an undefined nimbus of eroticism and mystical passion.

In literature, *Jerusalem Delivered* by Torquato Tasso deserves a special note, a prime example of the epic-chivalric genre, where events on Earth of the First Crusade are inseparable from a contextual war waged between the invisible forces of heaven and hell. The beginning of the poem features a description of the archangel Gabriel, sent by God to Godfrey to tell him he has been elected as Captain of the Crusaders: “[...] il Re del mondo,/ chiama a sé dagli angelici splendori/ Gabriel, che ne’ primi era secondo./ È tra Dio questi e l’anime migliori/ interprete fedel, nunzio giocondo:/giù i decreti del Ciel porta, ed al Cielo/ riporta de’ mortali i preghi e’l zelo” (Book 1.11). (“The gentle Gabriel called he from the rest / ‘Twixt God and souls of men that righteous been / Ambassador is he, forever blest /The just

commands of heaven's Eternal King / 'Twixt skies and earth, he up and down doth bring"). The archangel Michael also makes an appearance in the poem: "(...) il qual ne l'armi/di lucido adamante arde e lampeggia" (Book 9.58), "(...) in harness strong/Of never yielding diamonds armed sure") and is called the "*duce de' guerrieri alati*" (the head of the winged warriors – Book 9.60). In the poem, the conception of the planets governed by God through the angels is briefly reiterated (Book 9.61). Michael later reappears to celebrate the final victory in a vision that only Godfrey perceives, in which he is briefly allowed to see in the sky the hosts of angel armies fighting alongside the crusaders (Book 18.92–97).

Demonology

Philosophy and Theology

It is worth considering the treatises on demons during the Renaissance again according to the type of publication. In the scholastic-type treatises (such as *De angelis* by Suarez), as mentioned above, there were specific sections on demons. Here the sources are usually limited to traditional classical philosophy, especially Plato and Aristotle, together with the Church Fathers, great doctors of the Middle Ages, and discussion of the aforementioned main commentaries on St. Thomas Aquinas. The issues focused on the precise moment when angels fell, on the sin that caused their fall, on the way demons may inhabit a body, and on how these bodies are different from those of humans. In addition to discussions regarding exorcism, there are also frequent questions on the ranking and distinction between demons.

However, in order to find works with copious references to demons or that deal exclusively with this topic, we need to shift from official academic environments to a variety of different esoteric disciplines and works on magic. The main sources of literature on demons in late antiquity and during the Middle Ages were translated into Latin by Marsilio Ficino, thereby extending their dissemination throughout intellectual circles during the Renaissance: some of the most famous examples

are *De abstinencia* by Porphyry, *De mysteriis* by Iamblichus, and *De sacrificio et magia* by Proclus, together with *De daemonibus* by Pseudo-Psellus. These are often clandestine works that were censored or viewed with great suspicion by the Church, both Catholic and Protestant. Indeed, the works often bordered on sorcery, despite the enormous efforts made by the great Renaissance theorists of magic (from Pico to Trithemius, from Paracelsus, Agrippa, Bruno to Campanella – but the list of names could be extended to include other more or less renowned Hermeticists such as Plethon, Lazzarelli, Zorzi, Della Porta, Lefèvre d'Étaple, Bovelles, Champier, and Postel), to draw a clear line between natural, orthodox magic and the diabolical, deplorable magic that they condemned.

Among the most influential works by Trithemius are *De Septem Secundeis* (1545) and especially *Steganographia* (written around 1499, but only published posthumously in 1606), a work that would influence his own pupil, Agrippa von Nettesheim. Agrippa is especially well known for his three books, *De occulta Philosophia* (1533), a work that also includes numerous and precise references to demons, especially in the third book that is dedicated to ritual magic. Many of the references to demons in works on magic by Bruno (*De magia mathematica*, *De rerum principiis*, *De magia naturali*) were drawn from Trithemius and Agrippa. Campanella's theological works also include a study on the nature of angels that remained unpublished during his lifetime (*De supernaturalibus creaturis*).

In Girolamo Cardano, for example, *De secretis* (1562), demons are an integral part of the original fusion of magic and medicine. Cardano's original position is also characterized by his criticism directed against the third book of Agrippa's work on the possibility of interacting with demons.

A successful and influential work that contributed to the spread of demonology during the Renaissance is *De Praestigiis daemonum* (1563) by Agrippa's disciple, Johann Weyer (Wierus), which contained an appendix entitled *Pseudomonarchia daemonum*, also distributed separately. The *Pseudomonarchia daemonum*,

which is likely to have been based on various works on magic and the Cabbala similar to those described by Trithemius in his *Antipalus maleficiorum* (1605, posthumous – see below), contains numerous names of demons with their respective ranks, alleged prerogatives, or powers. Weyer was also one of the first authors to write against the abuses that took place during witchcraft trials, together with other opponents, such as Friedrich von Spee. On the other hand, arguing against Weyer's staunch defense of women accused of witchcraft was Jean Bodin, in his *De la Démonomanie des sorciers* (1580).

In addition to the short, doctrinal texts to be found in various catechisms, another important literary source on demons was the manuals on witchcraft. Among the most important examples of this genre were *Formicarius* (1475) by the Dominican friar, Johannes Nieder, the immensely popular *Malleus Maleficarum* (1487) by the Dominican friars, Jacob Sprenger and Heinrich Kramer, and *De lamiis et pythonicis mulieribus* (1489) by Ulrich Molitor. The Milanese theologian, Francesco Maria Guaccio, is the author of another well-known manual that was considered highly authoritative, his *Compendium Maleficarum* (1608).

Undoubtedly influenced by the sensation caused by a famous witchcraft trial in his kingdom in the early 1590s, James VI Stuart, king of Scotland (subsequently James I, king of England), published a work in 1597 entitled *Daemonologie, In Forme of a Dialogue*, which was a sort of brief academic dissertation severely condemning necromancy and sorcery, which greatly influenced the whole culture of his time. In addition to philosophical and theological considerations, all these manuals and the work of King James itself include important accounts concerning trials, confessions, and judicial case history, with the precise aim of supporting and endorsing the theoretical arguments.

Impact and Legacy: Demonic Magic

As regards demonic magic or necromancy, the darkest and most perverse aspects of magic emerge, in which the occultist summons the infernal powers through specific rituals for his/her own

gain. Among the more influential and interesting accounts for the study of the tradition of magic and necromancy are what may be considered the most important and prominent bibliographical resources in the Renaissance, namely, a catalogue of books cited in the second chapter of *Antipalus maleficiorum* by Trithemius, books which he generally heavily criticized. About 100 works are listed, often anonymous or falsely attributed, and to date are largely unpublished or not clearly identified. Most of these books share the same genre called “grimoire.” In these texts true or imagined names of angels/demons are associated with the stars, seasons, days, and hours so as to offer accurate instructions for rituals. The most important message that emerges from such works is in fact the possibility of a real interaction between humans and demonic powers. Some examples of the books cited in Trithemius' list are *Claviculae Salomonis*, *Liber Officiorum*, *Picatrix*, *Liber Hermetis*, *Sepher Razielis*, *Secretum Alberti* (that Trithemius asserts was falsely attributed to Albertus Magnus), and many more.

In England it is worth mentioning the case of John Dee, who wrote down in his diary for years his conversations conducted with “angels,” aided by his “scryers” (assistant mediums). Dee also used seals that had been created thanks to revelations of the spirits with whom he was in contact and an obsidian mirror (of Aztec origin). These objects are currently housed in the British Museum.

Again in England, Robert Fludd (1574–1637) pursued a medical variation of angelology already perceived in some of Cardano's works. His entire work on medicine, *Integrum Morborum Mysterium: Sive Medicinae Catholicae Tomi Primi Tractatus Secundus* (1631), is based on the words in *Revelations* 7:1 – verses that were also the subject of 1 of the 15 famous woodcuts by Albrecht Dürer (*Apocalypsis cum Figuris*, 1498). Fludd includes the names of the demons that preside over the four cardinal points and winds that carry all sorts of diseases, as well as the names of the good angels who oppose them: in the east the archangel Michael opposes the demon Samael; the archangel Gabriel, who presides

over the north, against the demon Mahazael; Uriel in the south opposes Azael; and finally Raphael, in the west, stands up against the demon Azazel. These “geographical” power dynamics (that are not always accurately reflected in the illustrations) are considered the source of diseases and potential healing.

History of Art and Literature

Like the angels, demons also regularly appear in artworks depicting Biblical scenes. Such is the case, for example, of passages taken from the *Book of Isaiah* or from the *Book of Revelations* depicting *The Fall of Lucifer* and *The Fall of the Rebel Angels* (for instance, see Hieronymus Bosch (c. 1514) (Rotterdam, Museum Boijmans Van Beuningen) and Pieter Bruegel the Elder (1562) (Brussels, Royal Museum of Fine Arts)) (Fig. 1). Another typical theme is *The Three Temptations of Christ* (e.g., the frescoes by Botticelli (1480–1482) – Sistine Chapel). Unlike the angels, however, it is unusual for demons to be depicted as the principal figures of the artwork, as they are considered subordinate to the divine subjects (Christ, the Virgin Mary, the victorious angels, or saints). In the painting entitled *The Guardian Angel* (1615) by Domenichino

(Naples, Capodimonte Museum), the devil is crouching in the corner (bottom right-hand corner for the viewer of the artwork, on the left of the subject in the foreground) sporting a faun-like sneer. The animal features, claws, long, pointed ears, horns, and tail, are more or less recurrent features. When wings are actually portrayed, monochromatic and extremely dark, they are frequently in the shape of bats’ wings. Matteo da Lecce (1574), in *The Dispute over the Body of Moses*, dispenses with them altogether (although his angels are magnificently adorned with them) but highlights the tail and horns as horrific elements. Again in the Sistine Chapel, in the *Last Judgement*, Michelangelo depicts the demons wrapped around their prey (the souls of the damned) in dark shades that recall the earth, almost fusing with it. Hieronymus Bosch in *The Haywain Triptych* (c. 1516 – Madrid, Museo del Prado) and Pieter Bruegel the Elder, in the aforementioned *The Fall of the Rebel Angels*, are characterized by the fantastic explosion of the grotesque, created with elements taken from the world of animals, insects, reptiles, fish, and mollusks or from the plant world. The figures of these hybrid demons are arguably unique in the history of the visual arts.

Angels and Demons in the Renaissance,

Fig. 1 Pieter Bruegel the Elder. *The Fall of the Rebel Angels* (1562 – detail). (Brussels, Royal Museum of Fine Arts of Belgium. © RMFAB, Brussels)

There are various eminent examples of demons that appear in Renaissance literature. In *La vita* by Benvenuto Cellini (§ LXIVff.), the artist provides a vivid account of a Sicilian necromancer summoning demons near the Colosseum in Rome, in which the artist himself wished to participate. Famous and often amusing passages including devils may also be found in *Gargantua et Pantagruel* by Rabelais (see III, 14; III, 22–23; IV, 45–47).

There are numerous references to demons in Shakespeare's diabolical and gory *Macbeth*, from witches to fallen angels, to hell: "[Malcolm] Angels are bright still though the brightest fell"; "[Macduff] Not in the legions/ Of horrid hell can come a devil more damned/ In evils to top Macbeth" (*Mac.*, IV.III). However, it was only in the second half of the seventeenth century with Milton's *Paradise Lost* that a strong interest in these infernal beings was displayed.

Animals in the Renaissance

Cecilia Muratori

University of Warwick, Coventry, UK

Abstract

Philosophical discussions of animal nature are ubiquitous in Renaissance literature. Some of them are incidental, as Renaissance philosophers tended to approach the topic of defining animal nature as a pendant to the definition of human nature. Further, in historiographical terms, the rich variety of Renaissance discourses on animals has been overshadowed by the debate on Descartes' controversial theory that animals are senseless machines. Yet, there was a decisive rise in interest in the study of animal nature well before the mid-seventeenth century, due to two closely connected factors. First, scientific advancements in zoology and anatomy, and the beginnings of comparative anatomy, drew attention to the physical similarities between humans and (certain) animals, raising the question of whether their souls might resemble each other, too. Furthermore, the reception of ancient sources on animals, which circulated widely in the period – especially Aristotle, Pliny, Porphyry and Plutarch – reanimated the longstanding debate on whether and to what extent animals possess rationality.

Heritage and Rupture with the Tradition

“Who will not wonder at this chameleon of ours? [...] Who, then, will not admire the human being?” (Pico della Mirandola 2013, 123 and 133, translation slightly modified). The chameleon of Giovanni Pico della Mirandola (1463–1494) is probably the most famous Renaissance animal (see Höfele and Laqué 2011, 7–9; Busi 2007, 25–26). Yet, it is not a real animal, but rather a metaphor for the human condition. Like the skin of the chameleon, humanity is described by Pico as a blank canvas, with the potential to assume any characteristic, becoming bestial by tending towards the sensual life of animals, or elevating itself to rational life, or even to the intellectual life of angels. In thus functioning as a metaphor, however, Pico's chameleon suitably reflects the status of Renaissance animals, too: animals are ubiquitous in Renaissance philosophies, yet it is rare to find discussions of their nature explicitly foregrounded. As in the case of Pico, animality is often considered by Renaissance philosophers in terms of comparison with humanity, by way of stressing what animals lack and humans instead possess (see Muratori 2013a, 9–26). The most common approach was to consider the soul of animals as a life devoid of rationality: the life of animals was viewed as a life of passions, and the animal stood generically for the unruly tendency of certain kinds of behavior.

This approach had a long tradition, rooted equally in Aristotelian psychology – according to which animals are capable of imagination but not of thought (see for instance *De anima* 434a) – and in the Platonic representation of passions as unruly animals (as in the famous metaphor of the charioteer in *Phaedrus* 246ab). While real chameleons may change color, but not escape their animal condition, the marvellous human chameleon is presented as the only creature capable of choosing whether to live like an animal, a human, or even to rise to a higher, angelic level. Animals thus symbolize the animality within humans: those aspects of human life that are dependent on the activities of the body, and on instincts.

Traditionally, animals had been deployed since the Middle Ages as the representation and

incarnation of human behavior, and especially of virtues and vices: a human being could be described as being as sly as a fox, for instance, or as chaste as a dove. Medieval bestiaries used fictional animals to convey a moral and religious teaching. In such texts, the animal becomes an empty container, filled with symbolic meaning. This symbolic interpretation of animal nature persisted throughout the Renaissance, too, not least in art (Cohen 2008). At the same time, however, interest in animals as subjects of philosophical inquiry and of scientific investigation clearly intensified in the period. As a result, animals started to be viewed as more than just symbols for patterns of human behavior.

A common historiographical narrative has it that only from the mid-seventeenth century did philosophers and scientists become deeply engaged with questions regarding animal nature, as a reaction to the radical claim by René Descartes (1596–1650) that animals are akin to senseless machines, incapable not only of reasoning but also of feeling (on Descartes' theory: Gontier 2010; Spallanzani 2011; Wild 2006). The theory of the “bête machine” gave rise to a polarized debate between supporters and opponents of the view that animals and humans are qualitatively different, and do not share even the life of passions (Marcialis 1982; Muratori 2015). The prominent afterlife of Descartes' view has overshadowed the richness of earlier debates on animal nature. Pre-Cartesian, Renaissance writings on animals have thus remained understudied. This is also due to the fact that Renaissance reflections on animals are disseminated in a great variety of texts, and that they are often marginal to philosophical discussions of human nature as with Pico's famous chameleon.

Recent scholarship, however, has begun to reveal the extent to which animals were the focus of sustained philosophical enquiry (Adamson and Edwards 2018; Muratori 2013a; Dohm and Muratori 2013). Two major, linked developments were key in this respect: the renewed reception of ancient philosophical sources that discuss animal nature, especially Aristotle (Beullens et al. 1999; Perfetti 2000), Porphyry (Muratori 2014, Muratori 2019a), and

Plutarch (Pade 2013); and the critical assessment of such sources enabled by advances in the fields of anatomy, and zoology. It was during the Renaissance that the foundation of comparative anatomy was laid: by considering bodily similarities and differences between humans and animals, comparative anatomy offered philosophers new perspectives on the question of human uniqueness. In the emergent discussions of animals, the ancient legacy crucially coincided with new natural-philosophical approaches. The result was a lively, multifaceted debate that sought to determine differences and similarities between animals and humans, combining the study of animal and human bodies with a revision of ancient theories on animal and human psychology.

Innovative and Original Aspects

The publication of several major works on anatomy testifies to a new approach to the observation and analytical study of animal bodies in the sixteenth century (Pomata 2011; Enenkel and Smith 2014). Animals had been dissected since antiquity. Notably, the Greek physician Galen (130–210 AD) performed vivisection, especially on pigs, in order to gain information that could not be obtained from the vivisection of humans. This implied the assumption that at least on a purely physical level there existed a strong similarity between humans and certain animals, since discoveries made on animal bodies could be transferred, to a certain extent, to the understanding of the human body. As the study of anatomy offered further insight into the details of the physical similarities of humans and animals, the question arose regarding the interrelation of bodies and souls: if the bodies are similar, will the souls inhabiting those bodies also resemble each other?

In 1543, Andreas Vesalius (1514–1564) published *Humanis corporis fabrica*, a groundbreaking presentation of human anatomy. Reflecting on the structure of the human brain, Vesalius stated that he hardly noticed any differences in dissecting the human brain as opposed to the brains of other animals, such as apes, dogs, horses or sheep (Arbel 2017). With regard

to animal anatomy, it was through the study of ornithology in particular that the first images of anatomical comparison between animals and the human body were produced. In his *L'histoire de la nature des oyseaux* (1555), Pierre Belon du Mans published two tables in which the skeletons of humans and of birds were placed side-by-side to allow for a direct comparison of the bones and their proportions. In Italy, the Bolognese naturalist Ulisse Aldrovandi (1522–1605) followed a similar path with his *Ornithologiae, hoc est de avibus historiae libri XII* (1599–1603), a comprehensive work which includes not only anatomical descriptions of birds but also stories about animal behavior and sections on the uses of animals, including for medical purposes. Aldrovandi thus combines his own study and observation of animals with information drawn from classical sources, especially Pliny's *Natural History*, and Aristotle's works on animals. The border between direct observation and the transmission of reported information remained permeable: Aldrovandi notably also authored a history of monsters (*Monstrorum historia*, published 1642), presenting wondrous cases of creatures at the border of animal and human nature. Aldrovandi thus treated the differentiation of humans from animals from the perspective of popular tradition at the same time as that of anatomy. Such a combined approach would eventually be discredited by modern science as we understand it today, but it was common in the Renaissance, when scientists and philosophers strove to create a comprehensive view of nature.

A similar approach was developed by an older contemporary of Aldrovandi, the Swiss naturalist Conrad Gessner (1516–1565). His *Historiae animalium* (1551–1558) became one of the most influential zoological encyclopaedias of the Renaissance, providing for each animal an overview of the known data on physical structure and behavior, as well as its discussion in literary, historical, and religious sources; illustrations of several of the animals are included throughout the book, and became a highlight of the publication. The first book of Gessner's *Historiae* (*De quadrupedibus viviparis*) opens with a section from the preface by Theodore Gaza to his

translation of Aristotle's zoological works: under the title *De animalibus*, this influential edition was published for the first time in 1476. In the preface, Gaza had repeated Galen's opinion that Aristotle was the first anatomist (Aristotle 1476, a6v). But, as Gaza points out, Aristotle's deep interest in the animal world did not imply a disregard of metaphysical topics. Indeed, Aristotle was not only the principal point of reference and comparison for Renaissance zoology but also the main authority for the view that the human soul is radically different from the soul of animals, due to its capacity for rational thought. According to Aristotle's *On the Soul*, the animal soul is capable of sensation, and in most cases of imagination, but not of rational thought (Sorabji 1993). This conception of human uniqueness had been interpreted throughout the Middle Ages as the foundation for the idea that the human being is the pinnacle of creation: combining this Aristotelian view with Christianity, the human soul was considered to be immortal, in contrast to the mortal soul of animals.

The Aristotelian tradition, then, harbored a troublesome contrast with regard to animal nature: the study of animal bodies tended to reveal the similarities between humans and animals, while a radical difference was asserted on the level of psychology. Within the Aristotelian corpus, the zoological works seemed to point to elements of continuity between humans and animals, while *On the Soul* asserted an insurmountable distance between humans, endowed with speech and rationality (*logos*), and all other animals (Laspia 2016). In the Renaissance, as the study of anatomy progressed, this became even more evident: physical observation invited a reassessment of qualitative differences on the level of the invisible soul.

Some authors responded to this dichotomy by extending the conception of rationality to include animals as well. Bernardino Telesio (1509–1588) and Tommaso Campanella (1568–1639) both argue that the capability to think rationally is not the absolute point of distinction between humans and animals (Ebbersmeyer 2013; Ernst 2013). How – they ask – can sensation be entirely different from rationality, if data from sensation provide the necessary input for rational thinking? If

sensation and rationality are not radically different, but rather distinguished simply according to degree and not kind, it follows that animals must to some extent partake of reason, too (Muratori 2013b).

The debate on animal rationality is a key example of how the study of anatomy and the reception of ancient sources combined to create a new approach to animals in the Renaissance. The works of Girolamo Fabrici d'Acquapendente (1533–1619), professor of anatomy and surgery in Padua, are a case in point. From the study of anatomy he drew conclusions regarding the cognitive capabilities of animals, and came to question the notion of a radical differentiation between humans and animals. According to Fabrici d'Acquapendente, some species of animals can articulate their voice, too: animal language (*loquela*) shows that animals have preferences, feeling pleasure and pain, and it clearly expresses cognitive activity (Fabrici d'Acquapendente 2016; Gensini 2011, 2012). Against Aristotle, who had identified reasoning with the capability to speak – as *logos* – Fabrici understands the difference between animals and humans as a difference of degree rather than kind. Even if human languages are unique in using an alphabet, several species of animals share with humans the expressive modulation of voice.

A key authority to whom Fabrici recurs is Porphyry, who in *On Abstinence from Animal Food*, a detailed philosophical treatment of vegetarianism, had argued that animals partake in language and thus in rationality, too. *On Abstinence* was published in Latin in 1547 and the Greek *editio princeps* edited by Piero Vettori was printed the following year. The widespread reception of Porphyry's book helped to inform an aspect of Renaissance views of animals that scholars have until recently neglected: that of ethics (Muratori 2018, 2019a). Porphyry had argued that animals should not be exploited because they share in *logos*, since they demonstrate rationality in a variety of ways – from being capable of expressive voice, to choosing to avoid harm and seek to protect themselves and their offspring.

Another important source for ethical reflection on the status of animals was Plutarch's *Moralia*,

which was often reprinted after the first edition of 1509, and enjoyed international success. Three texts in particular were influential with regard to the attribution of rationality to animals, and its ethical implications: *Gryllos* (also known as *Bruta animalia ratione uti*), *De sollertia animalium*, and *De esu carniū*. *Gryllos* takes its title from the main character in the story, a companion of Ulysses, who was transformed into a pig by the magician, Circe. Given the ability to speak by Circe, he tells Ulysses that the life as animal is preferable to a life spent as human being. The dialogue inspired Renaissance philosophers to engage with the topic of the difference between animal and human life. For instance, *Circe* (1549) by Giambattista Gelli (1498–1563) is a re-working of the story in which the discussion of Aristotelian psychology plays a crucial role. The main question posed by the dialogue is whether there exist any differences between animal and human nature which justify considering the latter superior to the former (Muratori 2019b). Ulysses discusses this issue with several animals, asking whether they would prefer their current animal form to the human one: only one animal, the elephant, agrees to being turned back into a human being, on the basis of the Aristotelian theory that only humans are capable of rationality (Raber 2013, 1–4).

Girolamo Cardano (1501–1576) also broaches this matter in his encyclopedic *De subtilitate* (1550). Cardano combines keen interest in the zoological variety of animals with the metaphysical question regarding the criteria for ordering animals in a scale. He thus poses the central question about the impact of anatomy and zoology for a philosophical view of the human-animal distinction: what does the study of animals imply for the understanding of the human being as the pinnacle of creation? Cardano presents a view of nature in which the living creatures are not simply ordered hierarchically, and, most importantly, the world is not centered upon the human being alone (Giglioni 2014). For Cardano, the combined lesson learnt from the ancient sources (such as Pliny's account of the capabilities of animals, or indeed Porphyry and Plutarch) and from the new discoveries, must be that the animals lead lives of

their own, whose *raison d'être* is not to be useful to humans. In *De subtilitate*, the place of animals is within a broader presentation of nature as a whole (Cardano 1663, especially Books 9–11). Yet, they are not just symbols for humanity's various characters, but rather are considered by Cardano as creatures inhabiting the world in their own right.

Impact and Legacy

Cardano's real animals stand at the opposite end of the spectrum of Renaissance discourses to the use of animals as symbols (Muratori 2017). Indeed, like Pico's chameleon, philosophical engagement with the topic of animal nature took various shapes in the Renaissance. Negotiating the legacy of antiquity with the challenges coming from the study of anatomy, philosophical reflection on animals ranged from incidental reflections in zoological and anatomical treatises (as in the case of Aldrovandi or Gessner), to sections dedicated to animal nature within a new organisation of knowledge (as for Cardano). Renaissance animals are thus to be found at the crossroad of various disciplines and within different literary genres, including the rewriting of ancient stories, as in the case of Gelli's *Circe*. As the legacy of Aristotle's conception of human rationality was reassessed, the question of human uniqueness led to a thorough investigation of animal capabilities, from animal language (Fabrici d'Acquapendente), to the more general capability to perform rational thinking at least to a certain extent (as in Telesio and Campanella). As a new image of humanity emerged, the comparison with animals also stimulated challenges to anthropocentrism. By the mid seventeenth century, the frame of the debate had significantly changed due to the prominence of the Cartesian theory that animals must be declared devoid not only of rationality but also of sensation. Descartes considered the view that animals can think nothing more than a prejudice transmitted by the Ancients (see for instance Descartes 1964–1974, 267–279). Renaissance discourses on animals, by contrast, were founded on the varied interpretations of ancient sources, frequently in the light of new observations and discoveries.

Antiquarianism

Damiano Acciarino

Università Ca' Foscari Venezia, Venice, Italy

Abstract

The aim of this entry is to provide a definition for Renaissance antiquarianism as a cultural phenomenon that influenced the way the past was interpreted between the fourteenth and seventeenth centuries. This cultural pathway represented a methodological perspective which involved the cross-referencing of heterogeneous sources, strongly linked to mankind's perception of time, and which helped to shape historical consciousness. The focus then turns to the history of the phenomenon and an explanation of its methodology.

Scholarship

The first attempt to describe the phenomenon of antiquarianism as one of the key moments in the evolution of Renaissance thought can be traced back to the 1950s. Stimulated by the definition formulated by Arnaldo Momigliano in his seminal article “Ancient History and the Antiquarian” (1950), the impact of material sources on the development of modern thought began to be clearly identified as a crucial factor in the classical tradition and the history of ideas. According to Momigliano, antiquarianism was a matter of historical method, which involved “the systematic collection of relics from the past” and their interpretation with a critical approach. He considered it to be strongly linked to mankind's perception of time which, thanks to the accumulation of remains over the centuries, helped to shape a deeper historical consciousness.

Scholars such as Eugenio Garin and Roberto Weiss attempted to coax out further aspects by taking into consideration the experience of philosophers and humanists from a diachronic perspective: Garin's *L'Umanesimo italiano: filosofia e vita civile nel Rinascimento* (1952) and Weiss's

The Renaissance Discovery of Classical antiquity (1969), offered general overviews of the many phases of this cultural movement. The monograph by Peter Burke, *The Renaissance sense of the past* (1969), the work of Sebastiano Timpanaro, *La genesi del Metodo di Lachman* (1960), and Silvia Rizzo, *Il lessico filologico degli umanisti* (1973), on Renaissance philological techniques and the many other studies conducted on the humanist method all shed further light on the origin of antiquarianism.

Important contributions to this area were made by Angelo Mazzocco, who explored these dynamics during the fifteenth century – especially in his *Flavio Biondo and the Antiquarian Tradition* (1985) – and by the studies of Anthony Grafton, who opened up several pathways for investigating the various aspects of this subject between the fifteenth and seventeenth centuries, his essays on Angelo Poliziano (1977), Joseph Scaliger (1983–1991), and Leon Battista Alberti (2000), as well as his collection of essays, *Bring out your dead: the past as revelation* (2001), all represent milestones in the field. Salvatore Settis, especially in his *Memoria dell'antico nell'arte italiana* (1984–1986), increased enormously the paradigms of the classical tradition within in the arts.

The strong foundations put in place by these masters have been built on more recently by several scholars, including Leonard Barkan, in the field of archaeology (1999); William Stenhouse, in epigraphy (2005), collecting (2014), and the idea of antiquarianism in general (2017); Christian Dekesel (1998), Federica Missere Fontana (2009), and John Cunnally (2016), in numismatics; Ingo Herklotz, who analyzed the figure of the antiquarian scholar (2012) as well several cases of ecclesiastical antiquarianism (2017) and antiquarianism in art (2019); Peter Miller, who approached antiquarianism with a geographical print (2015) and its interactions with collecting finds from antiquity (2017); Monica Centanni, who carried out a profound analysis of the many manifestations of classical tradition and rebirth of antiquity (2017); Kathleen Christian and Bianca De Divitiis, who investigated the development of local antiquarian surveys throughout Europe (2018); Joan Carbonell and Gerard Gonzalez

Germain (2020), who broadened the views on epigraphic scholarship; and Stefan Bauer, who unveiled new aspects of antiquarian studies within the context of ecclesiastical history (2019 and 2021). All these scholars have brought new readings to the multifarious and complex interpretations of this field.

Nevertheless, the concept of Renaissance antiquarianism per se has not yet been completely and fully defined: this remains very much a work in progress which deserves a thorough multi-disciplinary examination of the phenomenon from a transnational perspective. The very nature of Renaissance antiquarianism means it cannot be reduced to a simple formulation, nor can it be encapsulated in a single history: antiquarianism during the Renaissance is represented by a multitude of coexisting formulations that are expressed through a plurality of histories.

History

There are specific historical reasons why Renaissance antiquarianism became a vital piece in the puzzle of how to approach knowledge. Developing at the same time as new philological trends that found support from the increase in the number of archaeological investigations conducted, its history fully embraces the spirit of Humanism. Starting in Italy, antiquarianism spread throughout Europe between the fourteenth and seventeenth centuries, at which point the new scientific culture, which had initially been favored by antiquarian studies, began to establish a decisive influence as society moved toward a new phase of modernity.

Antiquarianism's origins date back to around the beginning of the fourteenth century in Padua, Veneto, where scholars such as Lovato Lovati (1240–1309) and Albertino Mussato (1261–1329) began rewriting the history of classics by removing the medieval influences from these texts. The work of Giovanni de Matociis (death 1337) of Verona is also worthy of mention, as he adorned the margins of the manuscript of his *Historia imperialis* with pictorial representations of the emperors that corresponded to his narrative

and which were somehow inspired by ancient coins.

Concurrent and corresponding phenomena took place in other areas of Italy. In Rome and its surrounding areas, interest toward and investigations of ancient ruins can be detected almost simultaneously: proto-humanists among whom Giovanni Colonna (1298–1343) and Zanobi da Strada (1312–1361) explored libraries discovering ancient manuscripts and started collecting and interpreting ancient epigraphic inscriptions. Cola di Rienzo's (1313–1354) public reading of the *Lex de imperio Vespasiani* represents an iconic transitional moment to a new perception of the antique and its role in history.

Nonetheless, the title of “founding father of Renaissance antiquarianism” can justifiably be attributed to Francesco Petrarca (1304–1374), who began developing an interest in the study of remains from antiquity in parallel with the many ancient manuscripts that he discovered. Within the broader restoration of the “golden age Latin,” Petrarch's followers, such as Coluccio Salutati (1331–1406), Niccolò Niccoli (1365–1437), and Poggio Bracciolini (1380–1459), represent the most prominent examples of how this humanistic sensitivity helped antiquarianism to develop in complexity. The Loggia dei Lanzi was being erected in Florence at precisely that time (c. 1396), clear evidence that the revival in literary output was matched by a resurgence in classical architecture.

A fundamental contribution to the development of this cultural dynamic was provided by Ciriaco d'Ancona (1391–1452), who, on account of his detailed descriptions of antiquity carried out during his many journeys throughout the Mediterranean, could very well be considered to be the initiator of modern archaeology. At much the same time, Giovanni Marcanova (c. 1410–1467) depicted Roman antiquities in his manuscripts, while Flavio Biondo (1392–1463) rewrote the history of Rome and many other Italian cities in his *Roma Instaurata* and *Roma Triumphans* by linking his classical readings with the findings of numerous inspections made on location. It is also interesting to note that Filippo Brunelleschi (1377–1446), inspired by the Pantheon in Rome,

projected the dome of Santa Maria del Fiore in Florence by applying the knowledge obtained from his observation of Roman ruins. He achieved this through his increased knowledge of forgotten elements of classical architecture and by using them to develop modern solutions: ancient source became the doorway to a new creation.

As sources of different types were uncovered, the understanding gradually dawned that texts and material findings could be complementary elements. This realization became essential for the interpenetration of the concept of history and cultural heritage, which implied the emergence of a renewed sensitivity to the unitary coherence of classical tradition. In essence, the antiquarian perspective embodied the spirit that allowed Leon Battista Alberti (1404–1472) to read Vitruvius critically, to write *De re aedificatoria*, and to conceive the facade of the Basilica of Sant'Andrea in Mantova as a Roman triumphal arch. Alberti was also the creator of the *Certamen Coronarium* (1441), a poetry contest which celebrated the incorporation of the Latin quantitative metric system into the Italian language – the purpose was to translate the structure of ancient poetry into contemporary language.

In the late fifteenth century, the driving force behind this evolution of thought is considered to be Angelo Poliziano (1454–1494), who constructed a critical method in his *Miscellanea* that was so effective that it became the benchmark for the antiquarian scholars who followed. His intuitions in the field of classical philology, which were based on manuscript witnesses, the identification of linguistic usages through the history of language, the constitution of cultural models, the comparative technique, and a rudimentary paleography, brought to light what was later referred to as “the history of tradition.” In this way, he approached the text as an ancient finding and heritage of the past from which tangible data could be drawn.

This approach, however, the purpose of which was to reconstruct the original shape of this cultural inheritance, was not substantially sufficient to fill the gaps in the tradition. In response, the humanists compiled a diverse range of interpretative systems to tackle this issue. One example is

the *Castigationes Pliniana*e by Ermolao Barbaro (1454–1493), who drew analogies with the world around him, especially when explaining naturalistic items, in order to compensate for the general lack of knowledge of these matters at the time. This comparison became a necessary means adopted by scholarship in many fields in order to comprehend the ancient universe through known and controllable parameters.

In parallel, encyclopedic treatises started to flourish. Even if Biondo's works, the *Elegantiae* by Lorenzo Valla (1405–1457) and the *Orthographia* by Giovanni Tortelli (1400–1466) could be recognized as a significant prefiguration of this genre in an antiquarian perspective; a mature expression of Renaissance antiquarian encyclopedism can be found only later, in Giorgio Valla's (1447–1500) *De expetendis et fugiendis rebus opus*, Raffaele Maffei's (1451–1522) *Commentariorum rerum urbanarum libri XXXVIII*, Alessandro Alessandri's (1461–1523) *Dies geniales*, and Celio Rodigino's (1469–1525) *Antiquae lectiones*. These treatises attempted to approach the ancient world from a universal perspective, cross-referencing different literary and material sources, trying to provide a complex idea of history.

The idea that history resided in ancient findings and that, through these ancient findings, history still maintained its vitality in the present sparked the research of material evidence to the indiscriminate action of counterfeiters. Forgeries were created for the purpose of supporting positions that lacked reliable data; and the frequent attempts to unmask their mendacious nature, at times in vain, represented one of the crucial aspects of the antiquarian investigation. By rejecting the authenticity of the *Donation of Constantine*, Lorenzo Valla (1406–1457) gave impetus to the unmasking of falsifications. Having rejected a testimony which had been trusted during the Middle Ages, he clearly demonstrated how the new vision of sources in their material consistency marked a change in thinking. Among the most famous antiquarian counterfeiters were Annio di Viterbo (1437–1502) and Alfonso Ceccarelli (1532–1583). The works of Annio became very popular: he produced literary and epigraphic

apocryphal texts (Berosus, Fabius Pictor, Cato, the *Decretum Desiderii*) in order to offer a new cabalistic and esoteric reading of the history of civilization that had been handed down directly from Hebrew and Etruscan sources. The extensive work of Ceccarelli, which remained predominantly in manuscript form, was put to use in genealogical and historiographical studies.

Antiquarian studies were conducted in humanistic circles, the most famous of which was the Academia Romana of Giulio Pomponio Leto (1428–1498); figures as Bartolomeo Platina (1421–1481) and Niccolò Perotti (1430–1480) frequently participated in its sessions. The humanist inclination of this circle and its desire to “revive” antiquity triggered an interest in ancient sources, the rediscovery and publication of manuscripts (one of the most important cases being the unearthing the *Codex Farnesianus* of Festus), the study of material findings (inscriptions, coins, statues, etc.), the research into institutional and social history, and the customs of ancient Rome.

One of the heirs to this cultural experience was Angelo Colocci (1474–1549), who continued this intellectual circle at Horti Sallustiani, where antiquarian interests flourished. Among the participants, Baldassarre Castiglione (1478–1529), Giovanni Pierio Valeriano (1477–1558), and Pietro Bembo (1470–1547), in particular, are worthy of mention. The presence of the three humanists, Bembo, Valeriano, and Colocci confirms that the antiquarian perspective was carried out in parallel with the historical-linguistic theories debated at the time and had a tangible effect on them. Its impact on the works of Theodore Bibliander (1506–1564) and Joachim Péron (1498–1559) is clear from *De ratione communium linguarum et litterarum commentarius* and *Dialogorum de linguae Gallicae origine, eiusque cum Graeca cognatione*, respectively.

Between the end of the fifteenth century and the beginning of the sixteenth century, antiquarian studies gradually became inextricably linked with collections of antiquities. Although important private collections also existed, the main collections of antiquities built up during the Renaissance were owned by the political and ecclesiastical aristocracy and were often connected to the royal

courts. This created a close bond, often of subordination, between antiquarian erudition and power, putting the first at the service of the second. Beyond the political interference that may have taken place, the most important antiquarian works of the sixteenth century emanated from the richest and most heterogeneous collections, such as those which belonged to the Farnese family in Rome, to the Medici in Florence, to the Este in Ferrara, or to the Palatine collection in Vienna and the royal collection in Madrid.

Many erudite works flourished within these environments. These included, for example, the philological and numismatic investigations carried out by Antonio Agustín (1517–1586) and Fulvio Orsini (1529–1600), the ecclesiastical and juridical enquiries by Onofrio Panvinio (1530–1568), and the extensive antiquarian encyclopedia written by Pirro Ligorio (1513–1583), which all benefited from the vitality of the Roman environment. The philological studies on classical texts conducted by Piero Vettori (1499–1585) and the antiquarian studies by Vincenzio Borghini (1515–1580) were deeply rooted in the Florentine context, and the mythographic studies of Lilio Gregorio Giraldi (1479–1552) and Agostino Mosti (1505–1584) were firmly based in the culture of the Ferrarese court. Austria and Spain were also fertile grounds for the works of Wolfgang Lazius (1514–1565) and Jeronimo Zurita (1512–1580), respectively.

The connection to the political power of the time permitted the antiquarian investigation to break free from the closed circles of collections and libraries and to be disseminated into the collective imagination, thereby developing into one of the columns of the triumphant Renaissance. When planning their works, it was common practice for artists and architects to receive support from antiquarian scholars, who took on the role of iconographic advisors and enhanced the conceptual coherence of the patron's projects. Giorgio Vasari (1511–1574) was supported by Borghini when decorating the Palazzo Vecchio in Florence, the Zuccari brothers by Orsini or Panvinio for the Palazzo Farnese in Caprarola, and Rosso Fiorentino (1495–1540) by a figure who remains anonymous for the Gallery of

Francis I in Fontainebleau (probably Lazare de Baïf); more rarely, the same artist took on the role of iconographer, and this was perhaps the case with Jacopo Zucchi (1542–1596).

In artistic contexts, it was possible for a stylistic feature of antiquarian origin to enter into standard decorative schemes, so that it was difficult to distinguish between the reuse of classical elements and a voluntary or unconscious citation: this was especially the case with grotesques, which became commonplace after their rediscovery in the Domus Aurea (1479 ca.) and provoked a debate about their legitimacy and whether they should be subject to censorship. Anton Francesco Doni (1513–1574), Francisco de Hollanda (1517–1585), and Gabriele Paleotti (1522–1597), among others, were prominent in these disputes.

The fundamental role played by architecture underwent a revival in the development of the Renaissance antiquarian spirit. After the fifteenth century, this took the form of evocations inspired by classical buildings; and during the sixteenth century, several treatises attempted to provide a more precise and complex codification of classical architecture. Sebastiano Serlio (1475–1554), Paolo Giovio (1483–1552), Guillaume Philandrier (1505–1563), and Claudio Tolomei's (1492–1556) *Accademia dei Virtuosi*, Daniele Barbaro (1514–1570), Jacques Androuet du Cerceau (1515–1585), and, perhaps most importantly, Andrea Palladio (1508–1580) combined the study of Vitruvius with practical knowledge, paving the way for a time of deeply rooted classicism.

Another form of antiquarianism in Renaissance cultural life can be seen in the *imprese*. This genre, which was inspired by emblems, combined images and short texts (usually a motto), often reutilizing erudite elements of the antiquarian investigation and related them to the addressee. Starting with Andrea Alciati (1492–1550), who was the first to codify this “figurative literature,” a widespread editorial phenomenon took place involving scholars from all over Europe, including Girolamo Ruscelli (1518–1566), János Zsámboky (1531–1584), and Jean Jacques Boissard (1528–1602). The

most famous motto of the Renaissance was *festina lente*, most commonly presented as an anchor and a dolphin. Originally, this figuration was minted on the reverse side of a coin of the Roman imperial series of Augustus and Titus. The image and the adage were represented and cited in the *Hypnerotomachia Poliphili* (1499), adopted by Aldo Manuzio (1449–1515) as the symbol for his publishing house; they were explained in their original sense by Desiderius Erasmus (1466–1536) in his *Adagia* and reinvented by Cosimo I de' Medici, the Grand Duke of Tuscany in his *impresa*.

The rediscovery of the *Fasti Consulares* in the Roman Forum (1546) was a pivotal moment in the growth of the entire antiquarian movement. This epigraphic finding was transferred to the Capitulum under the supervision of Michelangelo. The edition of the text transmitted in these inscriptions triggered a debate among the experts of epigraphy and chronology, in particular Bartolomeo Marliani (1487–1566), Francesco Robortello (1516–1577), Carlo Sigonio (1520–1584), Panvinio, Martin Smetius (1525–1578), and Stephen Winand Pigge (1520–1604), who all published it within a few years of each other. The major contribution to antiquarian scholarship provided by this finding was that it represented a new source for ancient Roman chronology, which until then had been known only through literary histories, and represented an official document directly connected to Roman imperial institutions. Previously, Roman chronology had often been reconstructed by comparing Livy and Dionysius of Halicarnassus (whose accounts often contradicted each other), as demonstrated by the Roman chronotaxes of Gregorius Haloander (1501–1531), Johannes Cuspinianus (1473–1529), and Heinrich Glareanus (1488–1563).

The number of findings from classical antiquity was higher in Italy than the rest of Europe. And, although many humanists of other nations travelled to and resided for long periods in Italy, it was not possible for everyone to directly access a wide range of ancient findings. Nonetheless, antiquarian understanding had developed in the rest of Europe by the mid-fifteenth century and gradually

strengthened to the point where Italy's leading position in governing this area of knowledge was challenged.

One of the earliest examples of this circulation of ideas is represented by the arrival in Germany of a partial copy of the *Commentaria* of Ciriaco d'Ancona, brought by Hartmann Schedel (1440–1514), which had a significant influence on the compilation of Peter Apian's (1495–1552) epigraphic collection and some of the later works of Albrecht Dürer (1471–1528). Furthermore, Jacopo Strada's (1507–1588) arrangement of his own *Magnum ac Novum Opus* for the Fugger bankers demonstrated how antiquarian culture passed across the Alps. And the studies on Roman antiquity conducted by Johann Roszfeld (1550–1626) clearly revealed the impact of this tradition on learned German milieus.

In France, the growth of antiquarian scholarship was encouraged by King Francis I and by the circle of humanists who gravitated around him. The studies of Guillaume Budé (1468–1540), who was an ambassador to Rome, and the journeys he made to Italy helped him amass a weight of numismatic knowledge that led to the publication of the most important Renaissance metrological treatise, *De asse*. The research carried out by Lazare de Baïf (1496–1547) was also crucial; he was an ambassador to Venice, from where he sent several antiquities to his homeland, and arranged for innovative antiquarian investigations to be carried out on clothing, vases, and vessels. Guillaume Du Choul (1496–1560) investigated several aspects of Roman religion by cross-referencing material and literary sources. Joseph Scaliger (1540–1609) demonstrated his antiquarian scholarship in his editing of ancient authors and his work on historical chronology.

Antiquarian erudition was also practiced at the highest level in the Low Countries. Hubert Goltzius (1526–1583), one of the most famous numismatists of the second half of the sixteenth century, developed his scholarship while traveling from the Netherlands to Italy: the purpose of his publications was to reconstruct the history of the Roman Empire by drawing links between ancient coins and inscriptions and their related narrative sources. Justus Lipsius (1547–1606),

who spent part of his life in Rome, investigated many aspects of classical and biblical antiquity, including banqueting, poliorcetica, the real nature of the Christian cross, and more complex analyses of Roman civilization. Even though his focus was mainly philological in nature, Lipsius often used material findings to carry out his emendations and corrections of ancient texts; his *Antiquae lectiones* provide a clear example of this methodological approach. The long journey through Italy completed by Peter Paul Rubens (1577–1640) also contributed significantly to antiquarian scholarship: he was a learned painter, and it has been proved that his drawings of statues and ruins increased the knowledge on the material bequest of antiquity, thanks also to the help of his brother Philip (1574–1611) and his son Albert (1614–1657).

The main means through which antiquarianism became a continental phenomenon was the circulation of published books. The philological editions of ancient authors and historiographical texts, especially if they included images, had a significant positive effect on the understanding of indirect records. In this way, the knowledge acquired in Italy was made available to the rest of the European humanist community, allowing research to be undertaken where findings were missing. The works of Antoine Lafréry (1512–1577) and Giovanni Battista de' Cavalieri (1525–1601) are worthy of mention in this context.

Antiquarian surveys also included national investigations, the purpose of which was to reconstruct a reliable history for a specific territory, following the model of the studies undertaken on Roman antiquity. Therefore, by comparing local literary sources with local ruins, it was possible to give a new shape to the origins of (i) France, described, for example, in the works of Pierre Pithou (1539–1596); (ii) England, investigated by William Camden's (1551–1623) *Britannia*; (iii) Germany, studied in Johan Månsson's (1488–1544) and Philipp Clüver's (1580–1622) treatises; and (iv) Spain, researched by Zurita's and Francisco Padilla's (1527–1607). In the same period, the Polish scholar Jan Łasicki (1534–1602) attempted to complete the first

erudite history of Russia, while histories of the Turkish Empire, China, and the New World, contaminating travel literature with antiquarian accounts, also flourished.

The hypothesis that there was a relationship between the triumph of antiquarian culture and the explosion of religious controversies in Northern Europe is very interesting, especially given the impact of the Reformed Approach to sacred scriptures on spiritual life. For example, the New Testamentary Commentary of Erasmus could have taken advantage of the experience acquired in his antiquarian publications. As one would expect, humanists and theologians (Catholic and Protestant alike) used antiquarianism to support their own positions and contest opposing views. The *Magdeburg Centuries*, which was overseen by Matija Vlačić (1520–1575), represented the high point for Protestant antiquarian writings and breathed life into a constellation of analogous works by authors such as Matthew Parker (1504–1575), Johan Jakob Gryner (1540–1617) and Johann Wilhelm Stucki (1542–1607). On the Catholic side, the most complete and organized response is represented by the *Annales* of Cesare Baronio (1538–1607), the purpose of which was not only to rehabilitate the Roman vision of Christianity from a historiographic perspective but also to utilize a more precise and systematic antiquarian approach. These patterns remained popular for most of the seventeenth century, as demonstrated by the monumental *Roma Sotterranea* written by Antonio Bosio (1575–1629), and *Italia Sacra* written by Ferdinando Ughelli (1595–1670).

Although the antiquarian tradition continued to generate very important successors during the centuries that followed, the turning point for Renaissance antiquarianism can be narrowed down to the early seventeenth century, when its unsuitability for dealing with new scientific enquiries started to become obvious. Hybrid figures who continued to tread the traditional path began to emerge, but they were unable to remain indifferent to the impending new developments. This was especially the case with the medical, zoological, and botanical studies carried out by Conrad Gesner (1516–1565), Girolamo Mercuriale (1530–1606), Ulisse Aldrovandi

(1522–1605), and Giovanni Battista della Porta (1535–1615) and most of all with the astronomical and scientific investigations of Nicolas Fabri de Peiresc (1580–1637) and Pierre Gassendi (1592–1655). There are, however, two dates in particular which encapsulate this moment of transition: 1620, the year in which Francis Bacon (1561–1626) published his *Novum Organum*, and 1637, the year René Descartes' (1596–1650) *Discours de la méthode* was published. The emerging empiricism of evidence-based enquiry and philosophical skepticism started undermining the reliability of the antiquarian investigation, questioning the nature of the source and hence the value of the method, and this, in turn, opened the way to a new phase in the development of knowledge on the path to modernity.

Methodology

In antiquarian studies, the source began to take on a central role in the entire intellectual system and became the key aspect to consider when searching for knowledge about the past, thereby exerting an influence on the hermeneutical approach. During the Renaissance, many scholars debated the practical applications of the antiquarian methodology. Beyond specific objects of study, antiquarian techniques generally converged on a dual scheme which included a cataloguing phase and an interpretative phase. A large number of records had to be compiled (both directly and indirectly) in order to create a solid foundation; the records were then divided into different categories – in which the formal, geographical, political, and typological parameters were considered. After this descriptive stage, a process of amalgamation took place, which involved the cross-referencing of the data according to its common or distinctive elements, thereby establishing links with its cultural context in the process. The aim was for the interpretation of each finding to be grounded in the comprehension of its morphology, and these records were mainly used to fill gaps in knowledge, providing a plausible reconstruction through analogy.

Personal observation (*autopsia*) became essential in order to ascertain the reliability of the

antiquarian method and allowed other scholars to verify evidence or findings. It was no longer deemed sufficient to rely on texts that simply referred to an issue – it became necessary to elicit primary information and examine the works and pieces that developed around it. It was therefore important to study both primary and secondary sources, such as analogous treatises or commentaries, from a unitary perspective because they could provide further lost information.

Collections permitted antiquarian practice to be carried out widely. Thanks to the collections of ancient findings available, it was possible to carry out multidisciplinary excursions aimed at establishing the links between the different findings and the texts, transforming a general humanist interest in antiquity into a systematic approach to the subject. Although these collections cannot be identified with antiquarianism in and of themselves, they are related to its basic premises. The purpose of antiquarianism instead lays in its capacity to make the data react with the cultural context from which it derived, utilizing new instruments to understand the stratification of meanings, where the links between witnesses and time could be found.

The antiquarian approach during the Renaissance enabled the past to acquire a tangible and measurable connotation which was identified through its remains. The “materialization” of the object of study transformed each finding into a “semiotic” vehicle of unexpected meanings. This progress is particularly meaningful in that it moved away from the literary world: the written form lost its oracular connotation thanks to the objectivation of the support (codex/finding) and medium (the language). This represented a fundamental breakthrough in Renaissance antiquarian erudition: the awareness of the equivalence of sources. This equivalence was based on general categories which were subordinated to specific approaches. It was possible to obtain meaningful data from manuscripts, inscriptions, coins, statues, and the like due to the endeavors made in each specific discipline: philology, epigraphy, numismatics, archaeology, iconography, etc. For each field, the findings were ranked according to their reliability (the most consistent manuscripts,

the most relevant inscriptions, the best-preserved coins, etc.).

It was from this awareness that efforts were made, commencing with the collation of manuscripts, then associating of different pieces of material evidence to confirm the existence of a historical fact, and finally evaluating of data from different and ostensibly incompatible cultural areas. This also resulted in parallels being drawn between the past and present. For example, by using descriptions from ancient sources, it was possible to compare geographical places with their modern circumstances and characteristics. Different linguistic domains (ancient languages vs. current vernaculars) could also be compared in order to explain the lost meanings of words and expressions.

It is therefore clear that the convergence of disciplines in the antiquarian method derived from the interaction of specific and coherent methodologies, which ultimately modified the conformation of the entire system. The advances of one method derived from the advances of others, but only progressively, and it was understood that all were part of the same whole. The reconstruction of the past (or the idea of the past) depended on the relationship between the plethora of aspects linked to a source and to the phenomena that occurred within the history of tradition.

Through conjecture, hypotheses were formulated on the basis of the remains for the purpose of restoring their original status, which required a theoretical cognition of their essence. This was founded on the philological principle of respecting the “text/object” as handed down, which was the precondition for any amendment or modification. This meant that the criteria of emendation (*emendatio*) had to be applied to the explanation (*explicatio*): clarifying the nature of a source through its tradition, i.e., the recovery of a reliable lesson (*accuratam lectionem*), also became essential for its interpretation (*lectionem utilem*).

The relationship between documentary voids and hypotheses of reconstruction emerged: all the lacunas could potentially be filled because they were part of a “cultural grammar,” the rules of which were deduced through antiquarian investigation. The illusion of a coherent reconstruction

of the heritage of the ancients became the foundation for the construction of a culture of the present in a universal perspective, rooted in the remains of a past perceived as incomplete but also solid in its material substance.

Scholars were encouraged to draw a distinction between their conjectures and hypothetic reconstructions, on the one hand, and the data transmitted, on the other. Only in this way was it possible to preserve the integrity of the tradition without contaminating the evidence and to allow future scholars to solve the problems which they faced.

Ignoring the origins of remains often not only opened the door to a new layer of corruption of tradition but also represented the limits beyond which it was not possible to push forward conjecture in all of its forms: the “void of knowledge” was considered somehow to be a starting point for the research to be undertaken. This focus on rejecting or accepting conjectures reinforced respect for tradition: the preferred solution was to adopt the “principle of authority,” defending the stability of tradition rather than accepting positions that could have potentially undermined the legacy of knowledge. At the same time, there were also scholars who claimed that real progress could only be achieved in antiquarian studies if new discoveries were made, pointing to the limits of the *auctoritas* and the lack of canonical sources.

This also implied the possibility of a credible reconstruction of the matter using external arguments (*argumenta*). In order to obtain a thorough comprehension of remains without omitting the complex weave of meanings involved, it was necessary to examine their connection to their historical background. Although these endeavors occasionally did not reap any rewards, they remained a mandatory stage of the investigation in that they examined a context from which it was possible to glean parallel or additional information. Contradictory data emerged from this process, a problem that encouraged the development of alternative solutions to preserve the coherence of the entire system.

In this phase, the concept of “error” (or the “nature of errors”) became a further instrument to be used in understanding sources more fully. It

was hypothesized that the persistence of errors in the tradition was due to those who physically assembled the object analyzed. This permitted a distinction to be made between the identity of the “author” (the creator) and the “maker” (a scribe, an engraver, a sculptor – but sometimes also the author), admitting the possibility of an unintentional fallacy despite the authority and antiquity being known. This distinction opened new perspectives: the admission that the error was potentially common to any type of writing, and hence to any type of communication, went straight to the core of the problem, i.e., the hand of the writer, as opposed to the surface on which the wording was written.

This represented the first emergence of the awareness that all the data deriving from sources could be influenced by several variables, which had to be understood in order to fully grasp the subject matter being studied. The source was considered to be influenced by contingencies (e.g., the social or economic status of the executor), implying that quantitative differences did not necessarily correspond to qualitative dynamics (e.g., if the errors were more frequently found in manuscripts or epigraphs).

This implied that all types of writing were governed by similar mechanisms, fostering the understanding of the two laws that influenced its morphology: norm and usage. All the potential fluctuations within these factors should be taken into account, with each specific occurrence assessed in accordance with diatopic (based on geographical place) diachronic (based on time), and diastratic (based on social, cultural, and educational factors) parameters.

Definition

The intellectual phenomenon of Renaissance antiquarianism developed throughout Europe, manifesting itself in a plurality of works influenced by the origin, the environment and the personal approach of each author, the language adopted, the publishing house involved, and the commissioner. These works were related to a multitude of disciplines, which can be broadly

identified by following the setup of Poliziano's *Panespistemon* (1491). The production of antiquarian works reached its peak during and after the mid-sixteenth century, a period when antiquarianism transitioned from a phase of growth and consolidation to maturity, and the advancements made in previous centuries were systemically classified and widely utilized.

Antiquarian interests can be divided into two key areas, both of which connect all derivative disciplines: the first could be defined as "orthographic," in which the material finding transmitted a written witness, in any form, and in a variety of languages, and the second as "iconographic," in which the investigation was based exclusively on the morphological aspect, beyond the linguistic factor. It was inevitable that these two contexts would be complementary and that they went hand in hand, mutually benefiting from their respective development. From here, different disciplines emerged, each with its own peculiarities, passing from the literary to the artistic to the scientific and many other areas of enquiry, and each with clearly defined cultural horizons.

The antiquarian writings of the Renaissance were generally categorized according to three models: miscellanies of scattered records, organic works which often contained an encyclopedic in compass, and monographs. In the first case, these works contained explanations of a plurality of misinterpreted or misunderstood passages referring to the antiquarian corpus in the broadest sense, frequently with the title of *Variae* or *Antiquae lectiones*. The works in the second case, on the other hand, were comprised of systematic expositions of antiquarian themes or topics that also took related contexts into consideration, thereby significantly widening the possible implications of a single study. In the third case, surveys on specific topics were carried out.

Therefore, Renaissance antiquarianism can be defined as a cultural phenomenon aiming at interpreting the past by cross-referencing heterogeneous sources thanks to accumulation and collection. This entailed the use of new investigative techniques which involved the combination of literary sources and material findings in order to provide a reliable foundation for the idea of

history. However, Renaissance antiquarianism must not be reduced to the mere collecting, nor can it be condensed to an intellectual interest or a general fascination with antiquity. It is reasonable to assume that Renaissance antiquarianism first emerged from the study of the classical world, but it eventually evolved beyond these boundaries to become a method of approaching an object of study rather than simply a discipline. Since the universality of the method became potentially applicable to all fields and times, its essence was manifested in the methodological pathway and perspective applied. In fact, the broadening of the sources from which it was possible to obtain historical data triggered the development of competencies and interpretative instruments, which allowed the identification of evidence from an array of objects of study. From this, it can be seen that Renaissance antiquarianism represented a methodological perspective, the purpose of which was to rethink the way the past was viewed through a critical analysis of sources, producing a renewed approach toward history, which stimulated the interaction of disciplines and influenced the intellectual life of the time.

Antitrinitarianism

Walter S. H. Lim

Department of English Language and Literature,
Faculty of Arts and Social Sciences, National
University of Singapore, Singapore, Singapore

Abstract

The doctrine of the Trinity is an important article of faith in orthodox Christian belief. Trinitarian doctrine asserts that there is one God who exists eternally as three divine persons or hypostases: The Father, the Son, and the Holy Spirit. The idea of the Trinity is complex, perplexing both skeptics and the faithful alike. Disagreements about the nature of the Trinity have led to the convening of councils (such as that of Nicaea and Constantinople) and formulation of creeds, aimed at separating the faithful who (are believed to) possess doctrinal truth from those who hold deviant or heretical beliefs. Doctrinal disagreements between trinitarians and antitrinitarians that took place in the fourth century, and which led to the formulation of the Nicene Creed, continued into the early modern period. As late as the seventeenth century in England and in Scotland, men were still burnt at the stake or sent to the gallows for not embracing the orthodox doctrine of the Trinity.

History and Implications

The doctrine of the Trinity is an important article of faith in orthodox Christian belief. Trinitarian doctrine asserts that there is one God who exists eternally as three divine persons or hypostases: The Father, the Son, and the Holy Spirit. The idea of the Trinity is complex, perplexing both skeptics and the faithful alike. The doctrine of the Trinity as we know it today owes much to an important council convened in 325 by the Roman Emperor Constantine in the city of Nicaea (in modern-day Turkey). Specifically, this council of the bishops was set up to resolve some issues of belief that divided the Christian church. The central topic dealt with by the Council of Nicaea was Arianism, a doctrine which asserts that Jesus Christ (the Son) is neither coeternal nor consubstantial (of the same essence) with God (the Father) because he was created at a point in time.

In Arian understanding, Christ is not divine but subordinate to the Father. Central to Arianism is the understanding that “the essence of true Godhood is unique and unbegotten (*agenetos*). This unbegotten essence belongs only to the paternal God, not to the Son or to the Holy Spirit” (Rumrich 1998, p. 79). Declaring Arianism’s antitrinitarian belief to be heretical, the Council of Nicaea asserts that the Son possesses the same substance (*homoousios*) as the Father, doctrinally affirming that the Father and the Son are equal in being and eternity. In 381, the credal statement formulated at Nicaea was refined and enlarged at the Council of Constantinople as the Nicene-Constantinopolitan Creed, a formal statement of belief familiarly known as the Nicene Creed. In an English translation of this Creed found in the Anglican Book of Common Prayer (1662), Jesus Christ is identified as “the only begotten son of God, Begotten of his Father before all worlds, God of God, Light of Light, Very God of very God, Begotten, not made, Being of one substance with the Father, By whom all things were made” (Cummings 2011, p. 392).

The Nicene Creed did not put an end to disagreements concerning the relationship between the persons of the Father, the Son, and the Holy Spirit constituting deity. In the early modern

period, the prominent Italian-born lawyer and theologian Faustus Socinus (Italian: Fausto Sozzini) (1539–1604) rejected the traditional account of the Trinity (McDonald 2016, p. 7), asserting that Jesus Christ is not divine but fully human, even though without sin. Influenced by Socinus’ antitrinitarianism, which was a development of the Arian heresy, members of the Minor Reformed Church of Poland (also known as the Polish Brethren) came to be referred to by their detractors as Socinians. After Socinus’ death, his followers published the Polish *Racovian Catechism* in 1605, a document which amounted to a nontrinitarian statement of faith (Rees 1818).

Divisions over doctrinal understanding of the nature of the Judeo-Christian God highlight the extent to which passions and convictions can reinforce a culture of deep and even violent intolerance. If the medieval Catholic Church used its immense ecclesiastical and political power to move against those it suspects of heresy (such as during the Holy Inquisition), the Reformation was also capable of deep intolerance, evinced, for example, in its antagonism toward the Catholic Church and also in violent doctrinal disagreements within its own fold. For both the Catholic Church and the Reformation, Arian antitrinitarianism was the archetypal heresy, generating violent reactions that included putting the heretic to death.

In 1553, the Spanish physician and theologian Michael Servetus (1511–1553) was burned for antitrinitarian heresy in Calvin’s Geneva. In England in 1612, during the reign of King James I, two men, Bartholomew Legate and Edward Wightman, were burnt at the stake for denying the Trinity (Atherton & Como 2005; Lim 2012, pp. 76–77). A monarch who ascended the English throne with no direct experience in dealing with the antitrinitarian heresy, which existed in pockets in parts of England, James I came to see himself responsible for extirpating this heresy from the land (Durstun 2006, pp. 125–126). Not only did the king have altercations with people who held antitrinitarian beliefs, but he was also involved in the conviction and execution of both Legate and Wightman (Durstun 2006, p. 126). In 1697 in Scotland, a 20-year-old student from Edinburgh, Thomas Aikenhead, was sent to the gallows for the

crime of blasphemy, which included denying the Holy Trinity. Found guilty under Scotland's two blasphemy acts of 1661 and 1695, Aikenhead was the last person in Great Britain to be executed for blasphemy (Graham 2008).

Disagreements over the nature of the Godhead not only unsettled relationships between members of the faithful but also influenced formulations of law in early modern England (Sirota 2013; Smith 2006). When the English Parliament passed the Act of Toleration (1689) granting freedom of worship to Non-Conformists (dissenting Protestants such as Baptists and Congregationalists), it excluded Roman Catholics and antitrinitarian Protestants (such as the Unitarians). It was only in the nineteenth century, with the passing of the Doctrine of the Trinity Act (1813) in the United Kingdom, that the legal requirement for people to believe in orthodox Trinitarian doctrine was removed.

Abstract

Arsenios Apostolis (Aristoboulos to his layman's name), the son of the scholar Michael Apostolis, was a post-Byzantine scholar and

philosopher and a Catholic clergyman and Archbishop of Monemvasia. He moved to Italy where he became acquainted with the cycle of the printer Aldus Manutius. He was more interested in philosophy than theology and he was more influenced by the historiographical tradition of Diogenes Laertius than by Aristotelian philosophy. Arsenios wrote appeals to prominent political figures in Western Europe exhorting them to undertake a Crusade in order to liberate Greece.

Alternate Names

Apostolis, Aristoboulos

Biography

Arsenios Apostolis was a Greek scholar and philosopher and also a Catholic clergyman and Archbishop of Monemvasia. He was the son of the scholar Michael Apostolis. In Heraklion (Candia), he studied philosophy with his father and with Manuel Corinthios (ca. 1483–1530) and became interested in philosophy. Orphan and poor, he moved to Italy where he became acquainted with the cycle of the printer Aldus Manutius. He taught philosophy in Heraklion, in the Greek Gymnasium of Rome, in Nauplion, and in Monemvasia. He composed an anthology of dicta of ancient Greek philosophers (1519) and edited the *Introduction to Plato's Dialogues* by the Greek philosopher of the second century AD Albinus. Apostolis admitted the difficulty for the Greek scholar of his times to write original works and the concern for practical life were to account for this incapacity. He was more influenced by the historiographical tradition of Diogenes Laertius than by the Aristotelian philosophy that was dominant in its Byzantine or its Neo-aristotelian form and taught to the Greek students in Padua. Apostolis engaged in correspondence with Erasmus and assisted him to complete the second edition of his anthology of Greek gnomes by providing him with his father's

collection of apophthegms and other similar material of his own (see Geanakoplos, 259 ff.). Like his father Michael, Arsenios wrote appeals to the powerful of the West exhorting them to undertake a crusade in order to liberate Greece (see Manoussacas, 25–57). In particular, he wrote appeals to Pope Leo X and to Pope Clement VII, but at the same time, he criticized the Latins for the exploitation of the Greeks living under the Italian rule (see A. Papadia-Lala, 122 ff).

Apostolis, Michael

Born: Constantinople, ca. 1420

Died: Venetian Crete, ca. 1480

Georgios Arabatzis

Department of Philosophy, Pedagogy and Psychology, National and Kapodistrian University of Athens, Athens, Greece

Abstract

Michael Apostolis (ca. 1420–ca. 1480) was a Greek Byzantine writer, scholar, scribe, and philosopher from the circle of Cardinal

Bessarion. He defended the Platonists in the quarrel between Platonists and Aristotelians. He returned to the Venetian Crete and contributed to the circulation of many ancient Greek manuscripts in Western Europe.

Biography

Michael Apostolis (Constantinople, ca. 1420–Venetian Crete, c. 1480) was a Byzantine writer, scholar, scribe, and philosopher and possibly a student of John Argyropoulos. Along with other Byzantine scholars, he left after the fall of Constantinople for Italy where he tried to establish himself professionally in a lucrative professorship of Greek language but without much success. He wrote an appeal to Western Europeans to undertake a crusade against the Ottomans and liberate his enslaved country. He took part in the great polemic between the Platonists and Aristotelians, by writing a treatise against Theodore Gaza's defense of Aristotle; in doing so, he alienated Cardinal Bessarion, his patron, since Gaza's ideas enjoyed the Cardinal's support. Bessarion wished to emphasize the compatibility of Plato's and Aristotle's philosophies; thus, Apostolis, by attacking the Aristotelians, made his situation more difficult. His failure to professionally succeed in Italy made him bitter and suspicious of the Latin West. After returning to Venetian Crete, he created a scriptorium and contributed to the production and circulation of many manuscripts in the West. In a discourse to the Italians about the condition of Greek studies in Italy entitled *Λόγος παραινετικός ἐκ Γορτύνης εἰς Ἰταλίαν Πώμης* (Exhortation from Gortyna to Rome in Italy), Apostolis defended the idea that the Greek language should be taught in Greek, otherwise the knowledge acquired would be inadequate. He also vindicated the superiority of the Greek culture over the Latin one, although he conceded that the Westerners, in his time, were in a dominant position and their future was more promising. He was the father of Arsenios (Aristoboulos) Apostolis.

Appetite, Renaissance Idea of

Doina-Cristina Rusu

Faculty of Philosophy, University of Groningen, Groningen, The Netherlands

Abstract

For Aristotle, the sensitive soul of animals was distinguished from the vegetative one because of its appetitive faculty. During Renaissance, the concept of appetite started to be applied not

only to animal and human soul but to nature in general. For several authors, nature was not conceived as a passive chunk receiving external forms and blindly following some pre-established ends. Quite the contrary, it was a “sentient” body, intentionally acting with the purpose of satisfying its appetites. The idea of an appetitive matter is associated with vitalism, panpsychism (or pansentism), and sometimes even animism.

Synonyms

[Desire](#); [Inclination](#); [Tendency](#)

Heritage and Rupture with Tradition

For Aristotle, animals and humans possess a sensitive soul responsible for emotions and desires. Its appetitive faculty is both irrational (in the case of animals) and rational (in the case of humans). This capacity of humans to control their desires and appetites in accordance with their reason is called moral virtue. Aristotle’s scheme of the souls was the model for medieval authors, who emphasized the moral virtue relative to the appetitive faculty as specific to humans and their free will.

During the Renaissance, appetite becomes a more central concept, as it is associated not only with the sensitive soul of animals and humans but with matter in general. Appetites explain the way in which nature operates, given that they are the source of sympathy and antipathy between bodies, and of attraction and repulsion; shortly, they are the sources of activity in matter.

Innovative and Original Aspects

Within the Aristotelian framework, Franciscus Toletus, for example, distinguishes between natural, sensitive, and intellectual appetite. The intellectual appetite is the desire for knowledge, the sensitive resembles Aristotle’s appetitive

faculty, while the natural are the inclinations or tendencies of things to recognize their ends, that is the good God established for them. This is based on the fact that matter is appetitive, namely it has the inclination to receive forms (Des Chene 1996).

If this Aristotelico-Scholastic framework matter remains passive, within the new vital conception, however, matter is conceived as having agency. In his *De rerum natura*, Bernardino Telesio describes matter not as a passive body receiving forms from the exterior and having propensities towards the ends pre-established by God, but as a body that has the appetite to preserve itself, based on the perception of what is good or bad. Nature, for Telesio, is aware of its ends and purposes (Giglioni 2010a). As a result of perceiving surrounding bodies and the appetite to preserve its own nature, bodies “know” how to react. Natural phenomena are thus the effects of an active matter attempting to satisfy its appetitive nature.

Francis Bacon, following Telesio, also conceives of matter and its particles as being endowed with appetites and perceptions. The main appetites are those of resistance and preservation (Bacon 1859–1874, 1996–). Following a tradition coming from natural magic, Bacon builds an experimental philosophy based on this appetitive character of matter. Nature can be changed and transformed when the experimenter knows how to manipulate the fundamental appetites of matter in order to obtain the desired effects (Rusu 2013).

Impact and Legacy

These appetitive characteristics of matter developed by Renaissance vitalist thinkers had a great impact upon early modern thinkers. To offer two of the most relevant examples, Baruch Spinoza’s “conatus,” central to his philosophy, has its roots in the idea of appetite for self-preservation; Spinoza’s bodies are also striving towards self-preservation. Later on, Gottfried Wilhelm Leibniz attributes appetite and perception to monads, the only simple and real substances, which enter into

composites. Appetites are monadic tendencies towards transitions to new perceptions and thus, without them, no change would occur in monads (Jorati 2016).

Arama, Isaac ben Moses

Born: Spain, c. 1420

Died: Naples 1494

Josef Stern

The University of Chicago, Chicago, IL, USA

Abstract

A leading rabbi of the generation that underwent expulsion from Spain in 1492, Arama is best known for his philosophical sermons and biblical commentaries that oppose the Aristotelianism of Maimonides and his followers: their subordination of revelation to reason; their belief in the eternity of the universe; and its consequent necessity that excludes miracles and individual providence. Yet Arama is no fideist, and values reason and philosophy as ways of deepening human understanding of Scripture, expressed through allegorical interpretation. A critic of previous enumerations of the basic beliefs, dogmas, or articles of faith of Judaism, Arama proposes his own list of six principles whose primary principle is creation which entails the possibility of miracles and individual providence. Arama's major work, the *Aqedat Yitzhaq* ("The Binding of Isaac"), a collection of philosophical sermons that bring together philosophical argument and scriptural exegesis, was very popular and exercised a significant influence on subsequent Jewish thinkers, especially Isaac Abrabanel.

Biography

A leading rabbi of the generation that underwent expulsion from Spain in 1492, Arama served as rabbi of a number of smaller communities in Aragon but primarily in Calatayud (Zaragoza), where he composed his mature works and engaged in several public disputations with Christian scholars. In addition to their philosophical content, his works are a rich source of historical

information on the life and culture of the Jews in Spain. After the expulsion of 1492, Arama settled in Naples where he died.

Arama is best known for the philosophical sermons he composed to counter the conversionist sermons in Christian churches which his congregants were compelled to attend. These sermons were ultimately anthologized as the *Aqedat Yitzhaq* ("The Binding of Isaac"; first published in Salonica, 1522), which both attracted a wide popular audience and exercised significant influence on subsequent Jewish philosophy. Among Arama's other works are a polemical treatise on the relation between philosophy and religion (1552) and commentaries on the Five Scrolls (1561), the Book of Proverbs (1565?), and the Book of Esther (1518). He is also said to have written a commentary on Aristotle's *Ethics* which is no longer extant.

Heritage and Rupture

The *Aqedat Yitzhaq* is composed in the form of a biblical commentary on the Pentateuch, reflecting its origins as sermons. Its 105 "Portals," or chapters, are, distinctively, each divided into two parts, a "*derishah*" (an "investigation") and a "*perishah*" (an "exposition"). The *derishah* addresses a philosophical or theological problem prompted by the biblical and rabbinic texts with which the sermon traditionally begins. The *perishah*, like scholastic *quaestiones* and *dubitationes*, addresses specific difficulties in the exegesis of the biblical proof-text of the sermon, solving issues of interpretation in light of the earlier philosophical account (in the *derishah*). The two parts complement one another and form a harmonious unit.

Although Arama did not write a systematic philosophical treatise, a relatively well-integrated and coherent philosophical view emerges that addresses most of the then-live philosophical questions: the relation between faith/revelation and reason/philosophy; the allegorical method of scriptural interpretation; the foundational dogmas or articles of religion; creation and physics; miracles and the role of divine will; providence and evil; the immortality of the soul and ultimate

happiness; human freedom and divine foreknowledge; prophecy and the Law; and the status of ethics in religion.

Arama clearly falls within the medieval philosophical tradition initiated by Moses Maimonides, a tradition based on the Arabic Neo-Platonized Aristotle. However, his relation to the specific views of these earlier thinkers is quite ambivalent. Most influenced by Judah Halevi, Moses Nahmanides, and Hasdai Crescas among Jewish thinkers and by Al-Ghazali among the Muslims, Arama harshly criticizes the fourteenth-century Averroistically influenced Maimonideans Moses of Narbonne (Narboni) and Joseph ibn Caspi.

Innovative and Original Aspects

The essential beliefs of Judaism, Arama argues, transcend or contradict reason, and must be accepted on faith, which he describes as a voluntary assent to the teachings of Scripture despite one's inability to rationally demonstrate or establish them, despite one's intellectual uncertainty about their truth. Furthermore, recalling in a manner reminiscent of Augustine's, Arama holds that even beliefs that lie within the scope of one's rational ability, and that in principle can be demonstrated, should be first accepted on faith and only afterwards verified, or understood, by reason. Taking the biblical patriarch as his model, Arama argues that, just as Abraham overcame his reason when he was commanded to sacrifice his son Isaac, so the ideal religious person must not only subordinate his reason to faith, but should also seek out irresolvable paradoxes of reason in order to discipline himself to subject his intellect to his will and, ultimately, subordinate philosophy to revelation. Thus through reasoning itself one comes to recognize the inferiority of reason to revelation.

Another subject on which Arama deviates from his Jewish philosophical predecessors pertains to the use of allegorical exegesis of Scripture. Although he did much to revive the allegorical method of scriptural interpretation after its decline in the "Maimonidean controversy," he also upholds the validity of the literal

meaning; like Nahmanides, he insists that allegorical interpretations never displace the *peshat*, literal, plain, or contextual meaning and he sharply criticizes the extreme Averroistic Maimonideans who seek to replace the literal sense of the Torah with Greek philosophical ideas.

Arama's position in the fifteenth-century debate over the foundational articles of faith or dogmas of Judaism shows the subtlety of his approach to the relation between philosophy and revelation. His articles of faith are principles essential not just to the idea of a divine law in general but to Judaism in particular. Connecting these principles with the Mosaic commandments, he argues with Halevi and against Maimonides that one achieves perfection and immortality not through intellectual contemplation but by performance of the commandments, the one feature that truly distinguishes Judaism from other religions and from the general theism of the philosophers. The commandments themselves are not articles of faith. However, Arama identifies the true principles that constitute the articles as those that are enshrined in and expressed by specific commandments – e.g., belief in creation is manifest by the Sabbath commandment.

After criticizing previous enumerations of dogmas by, e.g., Maimonides, Crescas, and Joseph Albo, Arama presents his own list of six: creation, miracles, revelation, providence, repentance, and the immortality of the soul. Of these, creation is the most important from which all the others can be derived. Like Maimonides, Arama argues that reason can demonstrate neither eternity nor creation – putting the problem of the origin of the world beyond the scope of human reason – but he then argues that in this respect creation is simply representative, or typical, of all the essential truths of Judaism. None can be established purely by reason.

Nonetheless, Arama (perhaps influenced by Nahmanides or Gersonides) articulates a quasi-Platonic account of the world's origin from pre-existent matter, itself created *ex nihilo* by God. God Himself is essentially characterized by His unconstrained will; therefore, there is no sense in which the world is necessary or necessitated. Furthermore, Arama argues that only if the world was

created freely by God's voluntaristic will can there be miracles, providence, or divine omnipotence, all of which prove that God possesses the power to suspend the laws of nature. At the same time, Arama appeals to the attestation of miracles in Scripture as evidence against eternity.

Despite the centrality of miracles and divine omnipotence in his scheme, Arama does not refute the idea of natural law and he does not hesitate to offer rational explanations where he can of scriptural miracles. Instead he distinguishes between two co-existing natures: an unintelligent "natural nature," whose laws apply regardless of human merits and desert, and a "supernatural nature" directed purposefully by a divine intelligence that is sensitive to human deserts determined by human actions. Miracles violate the laws and necessities of natural nature; however, they are instances of supernatural nature and mirror the divine intelligence's sensitivity to human actions and deserts. Moreover, in addition to the observed violations of natural nature that we designate "miracles," Arama (again following Nahmanides) argues that "hidden" miracles – i.e., miracles that reflect and manifest supernatural attention to human actions even while that they conform to nature and natural laws – constantly occur despite the fact that we do not notice their miraculousness. Because their true explanation lies in supernatural nature, all miracles, one might say, fall under *a* nature, some natural, others supernatural nature. Similarly, Arama distinguishes "natural providence" and "supernatural providence." Natural providence is directed at the preservation of species and does not attend to the individual's – moral or intellectual – perfection. Supernatural, or "providential" governance or providence, in contrast, is sensitive to individual – especially moral and to a degree intellectual – perfection. Moreover, in general the latter is limited to Israel.

Philosophers deny supernatural nature and supernatural providence, Arama argues, because they rank humanity beneath the celestial spheres and cannot understand why God would violate a higher order for a lower one. Instead Arama follows Saadiah Gaon that humankind is the ultimate end of creation, hence, that the spheres were

created for the sake of humankind and can therefore be manipulated on their behalf. Part of the original creation, moreover, endowed humans with a special power over nature. When the soul rules, establishing the “divine image” in the microcosm of the human body, harmony results in the macrocosm as well. When sin disrupts the microcosmic harmony, the macrocosmic harmony is tampered at the same time and causes universal evils. Human beings can ensure cosmic harmony by living in harmony with nature and following the natural law, which is most fully realized in the Mosaic Law. Its commandments instill all moral and intellectual virtues, including those unknown to reason. Only a life according to this revealed law will bring humanity to its highest, spiritual happiness, the ultimate end of the true philosophy.

Like creation, Arama affirms a libertarian conception of human freedom of the will, and he discusses in detail the history of the problem of the incompatibility of human freedom and divine foreknowledge. Neither human freedom nor divine foreknowledge, he contends, can be sacrificed. Accordingly, he criticizes those philosophers who attempted to escape the dilemma posed by their incompatibility by denying one or the other. Moreover, insofar as human freedom entails that humans are responsible for their actions, and are to be blamed or praised only according to their freely chosen actions, Arama criticizes the Christian doctrine that grace, hence, the greatest human good, is freely given by God independently of human works. This, he claims, would be tantamount to denying human freedom and responsibility. Thus, grace must be earned by its recipient. Throughout his writings, Arama assigns a central place to Aristotle’s *Ethics*, which he cites almost as frequently as he cites the Bible and Talmud and which he takes to be compatible with the Torah.

Arama’s political philosophy is largely Maimonidean, i.e., Al-Farabian and Platonic, but it also evokes neo-republican themes that anticipate later thought. According to Arama, a political society is necessary to ensure law and order, the personal security of its citizens, and justice. But the law and order is itself simply a necessary condition in order to enable select individuals

achieve their ultimate happiness or spiritual perfection.

Impact and Legacy

Arama’s sermons were designed to meet the particular needs of his own era but they also became classics of Jewish homiletics and sermonic preaching, exercising a strong influence to this day. The *Aqedat Yitzhaq* remains a popular widely read rabbinic text. As philosophy, Amara’s view represents a conservative attempt to withstand the challenges of both radical Averroistic Maimonideanism and Christianity. His strongest influence, especially in his political philosophy, was on Don Isaac Abrabanel (1437–1508), a Portuguese Jewish philosopher, biblical exegete, and statesman. But his work was also esteemed by Christian theologians and at least one Portal of the *Aqedah* was translated into Latin.

Archimedes: Reception in the Renaissance

Jens Høyrup
Section for Philosophy and Science Studies,
Roskilde University, Roskilde, Denmark

Abstract

With only Apuleius and Augustine as partial exceptions, Latin Antiquity did not know Archimedes as a mathematician but only as an ingenious engineer and astronomer, serving his city and killed by fatal distraction when in the end it was taken by ruse. The Latin Middle Ages forgot even much of that, and when Archimedean mathematics was translated in the twelfth and thirteenth centuries, almost no integration with the traditional image of the person took place.

With the exception of Petrarca, who knew the civically useful engineer and the astrologer, fourteenth-century Humanists show no interest in Archimedes. In the fifteenth century, “higher artisans” with Humanist connections or education took interest in Archimedes the technician and started identifying with him. In mid-century, a new translation of most works from the Greek was made by Jacopo Cremonensis,

and Regiomontanus and a few other mathematicians began resurrecting the image of the geometer, yet without emulating him.

Giorgio Valla's posthumous *De expetendis et fugiendis rebus* from 1501 marks a watershed. Valla drew knowledge of the person as well as his works from Proclus and Pappus, thus integrating the two. Over the century, a number of editions also appeared, the *editio princeps* in 1544, and a mathematical work following the footsteps of Archimedes was made by Maurolico, Commandino, and others.

The Northern Renaissance only discovered Archimedes in the 1530s and for long only superficially. The first to express a (purely ideological) high appreciation is Ramus in 1569, and the first to make creative use of his mathematics was Viète in the 1590s.

Ancient Latin and Medieval Background

Archimedean mathematics had a certain impact in late Renaissance thinking, and it was important for changes in late Renaissance mathematics; however, much more pervasive, and of much longer duration, was the impact of “Archimedes” as an almost Protean figure, changing with the conditions of the time.

This figure was known to early Humanists exclusively through Latin sources (detailed in Høyrup 2017). These tell about the producer of marvelous military machines used in the defense of Syracuse and admired by Marcellus; about his fatal distraction when Syracuse was taken; about his “sphere,” a mechanical model of the heavenly system or his general mastery of astronomy; or, rarely, about his preoccupation with geometry, yet without indicating that this is more than a field dealing with figures drawn with a *radius* (Cicero, the Elder Pliny, Cassiodorus). Vitruvius ascribes to Archimedes a number of technical manuals that cannot be understood if one does not know natural philosophy and also tells the story of Hieron's crown. Archimedes' overall subtlety was proverbial in Cicero's time and circle.

Only two writers give hints that Archimedes made advanced geometric *theory* (yet in a way

that can only be understood by readers who know already): Apuleius, in the *Apology*, says that Archimedes' study of convex and concave mirrors outshines his general admirable subtlety in geometry, and Augustine, in *De utilitate credendi*, asks rhetorically who would take Epicurus as his guide to Archimedes' geometrical writings – “against which he spoke with much tenacity, in my opinion without understanding them.”

Medieval Latin culture until 1100 took very little notice. In the late eighth century, Paulus Diaconus borrowed some lines from Orosius referring to the role of Archimedes' machines in the defense of Syracuse, and around 810 Dungalus Reclusus took over from Macrobius that Cicero and Archimedes agree about the order of the heavenly spheres.

The twelfth century brought translation from the Arabic of a few Archimedean works (and of works drawing on Archimedes). Two translations of the *Measurement of the Circle* were made (one possibly by Plato of Tivoli and the other by Gerard of Cremona). The latter circulated well among mathematically active university scholars – witness the production of at least nine revised versions from the twelfth through the fourteenth century (Clagett 1964). Archimedean material was contained in the *Verba filiorum* of the Banū Mūsā, similarly translated by Gerard. The well-circulated *De curvis superficiebus* compiled in the late twelfth or earlier thirteenth century by John of Tynemouth contained material in Archimedean style; Roger Bacon ascribes it to Archimedes, while he never refers to the genuine works.

In 1269, William of Moerbeke made an almost complete translation of the Archimedean corpus from the Greek (ed. Clagett 1976). Only Witelo appears to have used it in the thirteenth century, but in the fourteenth it was drawn upon by Jean de Murs, Oresme, Henry of Hesse, and Albert of Saxony (Clagett 1978, 3–144) – all linked to Paris University.

Outside this restricted circle, only Gerard's *Measurement of the Circle* had repercussions. Around 1250, Vincent of Beauvais combined in *Speculum historiale* V. XLIII (1624, 149) quotations from Orosius (the machines and the defense of Syracuse) and Valerius Maximus (the death

story) with a reference to Archimedes's *Measurement of the Circle*, “of which Aristotle says that it can be but is not known” (*Categories* 7^b31–33). A century later, Walter Burley (1487, b ii^v) added to this a long *verbatim* borrowing from Valerius Maximus. On the whole, however, the Arabo-Latin as well as Moerbeke's Greco-Latin translations circulated in isolation from interest in the person – and information about the person was drawn from very few sources: Orosius, Macrobius, and Valerius Maximus.

Humanism from Petrarca to Alberti

As a rule, fourteenth-century Humanists were interested in neither the works nor the person (attitudes to Archimedes are dealt with under different but compatible perspectives in Laird 1991 and Høyrup 1992). Petrarca was, however, though only in the person. To judge from his letters, Archimedes was admittedly not central to him – he is mentioned only twice. Nonetheless, Petrarca did produce two biographical notices. In *De viris illustribus vitae* (1338), within the biography of Marcellus (Petrarca 1874, I, 280–282), he narrates in his own words Valerius Maximus' stories about Archimedes' powerful war machines and his death, with his own observations, twists, and additions: that even though Firmicus Maternus disparages Archimedes as a mechanic, he was formidable both as an astrologer and a geometer; that the figures he was drawing were astrological or geometrical; and, finally, that Cicero found Archimedes' grave. In *Rerum memorandarum libri* I.23 (1343) (Petrarca 1943, 22–24), an arrival in Syracuse offers the occasion to expand Livy's single line about Archimedes' unique observation of the heavens and the stars into a general praise of Archimedes' study of nature and of his sphere which allows understanding of the celestial motions not only by the mind but also by our eyes. Even more praiseworthy were his terrestrial mechanical feats; his fatal distraction, on the other hand, is slightly censured as “immoderate.” On both accounts, Platonizing celebration of the pure intellect is outside the perspective. The value scale is that of Cicero and the Roman elite, and

Archimedes is *almost* perfect when measured thus. Archimedes was part of the legitimate ancient heritage, respected because of his sophisticated machines, his planetary model as well as those that could serve efficiently in war. Even Petrarca's aversion for astrology only induces him to compare modern astrologers unfavorably to Ptolemy, Archimedes, and Firmicus Maternus, not to denigrate this aspect of his "Archimedes."

Other fourteenth-century Humanists were not interested in the Archimedes figure at all. That changed to some extent in the fifteenth century, as "higher artisans" (architects, painters, military engineers, etc.) and their ambience began to have intercourse with Humanists. Engineer artists like Mariano Taccola and Filippo Brunelleschi were known, respectively, as the "Archimedes of Siena" and a "second Archimedes." None of them were mathematicians. What they had in common with the "Archimedes" known at the time was to be skilled engineers and architects, designers of machines.

The main source for the admiration of Archimedes among the higher artisans is Vitruvius, a colleague. Leon Battista Alberti – the earliest outstanding Humanist who was also active as a higher artisan, Brunelleschi's partner in the creation of perspective technique – takes over Vitruvius's version of the crown story in the *Ludi matematici*. However, his *De re aedificatoria* shows that increasing familiarity with Plutarch's biography of Marcellus was also influential. It cites Plutarch for the tale of Archimedes moving a loaded ship on the ground and for the promise to be able to move this world if he could only go to another one.

As informative as borrowings is the way they are filtered. Alberti distances himself from part of what he reads and omits an essential part of Plutarch's Platonizing message. Plutarch's insistence that Archimedes considered mechanical work and even mechanical treatises improper is not argued against; it goes unmentioned – it would indeed disparage Alberti's own undertaking. Neoplatonism and esoteric Platonism remain unthinkable. Further, Alberti declares not to intend to be Zeuxis in painting, Nicomachus in the manipulation of numbers, or Archimedes

when dealing with angles and lines; he will stick to the basic principles and that which gives honor and fame to the architect. Admitting that Archimedes had been the supreme geometer (Plutarch says so), Vitruvius distances himself from this aspect of the hero.

Return of Archimedes the Mathematician

Even among Humanists with no direct links to architecture and engineering, there seems to have been some interest in Archimedes, probably because of what the Latin sources tell about him. In 1423–1424, rumors circulated that an Archimedes manuscript had been brought back from Byzantium. However, nobody ever saw it, and some 25 years passed before more happened among Humanists. Around 1450, however, Jacopo da San Cassiano Cremonensis made a fairly complete translation (d'Alessandro and Napolitani 2012). Of the works translated by Moerbeke, *On Floating bodies* is missing in the new translation, while *The Sand Reckoner*, absent from Moerbeke's Greek manuscript, is translated by Jacopo. None, of course, knew *On Method*. Whether Jacopo's translation was made while he was still in Mantua or after his move to the Papal court is not clear, the undertaking agrees well with Nicholas V's broader translation program. This translation is the basis for Regiomontanus' judgment from 1463/64 (1972, 45) that Euclid was

followed by Archimedes citizen of Syracuse, and by Apollonius of Perga, customarily called the Divine because of the height of his genius, of whom it is not easy to say whether one is to be preferred to the other. While, namely, Apollonius described the elements of conics in eight books, which have never been put into Latin, the first rank appears to belong to Archimedes the Sicilian by the variety of publications, which under Pope Nicholas V were rendered in Latin by a certain Jacopo of Cremona.

Both Jacopo and Regiomontanus were connected to Bessarion's circle, though at different moments. Bessarion himself was interested enough to get a copy for his library, and Cusanus expressed his gratitude to the Pope for having put the

manuscript at his disposition (which, however, did not affect his idiosyncratic approach to mathematics much). Apart from that, echoes among Humanists cannot be discerned during the first decades. It is noteworthy, moreover, that Jacopo himself had a thorough training in university philosophy, while Regiomontanus was an accomplished university astronomer, already familiar with the medieval direct and indirect Archimedean tradition before being introduced to Humanism by Bessarion (Clagett 1978, 343–354). Both therefore had a substantial fundament allowing them to understand Archimedes as an awe-inspiring geometer; Humanists with no similar background could only take such Latin sources on faith as claimed without specifying that he was ingenious. Even Regiomontanus, however, did not go beyond recognition – his own mathematics is not marked by Archimedean inspiration (after all, his primary interests were astronomy and astrology).

Among writers in the vicinity of the abacus tradition and the higher artisanate, there was a certain impact. Piero della Francesca, who had access to Jacopo's translation, has some Archimedean name-dropping in *De quinque corporibus regularibus* for matters that already appear without reference in his earlier *Trattato d'abbaco* (Clagett 1978, 396–398). Luca Pacioli, too, must have seen Jacopo's translation (ibid., 448, 460), but mostly draws on the direct and indirect medieval traditions for Archimedes' mathematics, giving only quite imprecise references; on the other hand, in the *Summa de arithmetica* ... (Pacioli 1494), he refers in the dedication to Duke Guidobaldo to "the great Syracusan geometer Archimedes" who with "his machines and mechanical inventions kept Syracuse safe for long." The passage is repeated almost verbatim in his *Divina proportione* (Pacioli 1509: b ii'), now addressed to Ludovico Sforza of Milan and characterizing Archimedes as a "noble ingenious geometer and most worthy architect" and pointing out that he defended his *patria*; in the same work, Pacioli gives further imprecise references to Archimedes' results.

The case of Leonardo da Vinci is similar but not identical. He appears to draw on recent as well

as medieval Archimedean mathematics (Clagett 1978, 478); he understands that Archimedes "never squared any figure with curved sides" but "only squared the circle minus the smallest portion that the intellect can conceive, that is the smallest point visible" (Leonardo da Vinci 1883, II, 446). Also insightful at least as to the conditions of his own epoch, Leonardo believes Marcellus wanted to find Archimedes in order to make use of his services – but when drawing on sources, he does so from approximate memory.

The Greek Text and Latin Printing

One late-fifteenth-century pure-breed Humanist manifested interest in Archimedes the mathematician: Giorgio Valla. He bought the manuscript from which Moerbeke had made his translation, and he at least saw Jacopo's translation (Clagett 1978, 462). He also possessed a manuscript of Proclus' commentary to *Elements* I, copied in part by himself (Rose 1975, 47). His posthumous *De expetendis et fugiendis rebus* (Valla 1501) returns to Archimedes' time and again, sometimes referring to what *could* have been known from Plutarch and the Latin sources but which Valla draws instead from Proclus (using almost every passage in Proclus' commentary referring to Archimedes); sometimes Valla discusses Archimedes' mathematics (not merely quoting or using results). Valla's "Archimedes" builds upon the same sources as his acquaintance with Archimedean mathematics – he has no need, neither for Plutarch nor for Latin anecdotes, even though he presents much of their substance.

The fifteenth-century "Archimedes" did not disappear completely for that. In 1568, Giorgio Vasari (1846, XI, 98) could still characterize the painter and architect Bartolomeo Genga as "a new Archimedes" because of his design of fortifications. Within the increasingly important and increasingly competent mathematical professions, however, Archimedes the mathematician came to equal or even overshadow his mechanic namesake.

The sixteenth century brought the printing of Archimedean works. In 1503, the astronomer

Luca Gaurico published a small volume containing Archimedes' *Quadrature of the parabola* and *Measurement of the circle* in Moerbeke's translation. In 1543, Tartaglia republished Gaurico's two Archimedean editions together with *On the equilibrium of Planes* and *On Floating Bodies I*, even these in Moerbeke's version. In 1560, Tartaglia further published as Book III of *La quarta parte del general trattato* an Italian translation of *On the Sphere and Cylinder I*.

The *editio princeps* of the Greek Archimedes was published by Thomas Gechauff Venatorius in Basel in 1544. The volume also offered Jacopo's translation as corrected by Regiomontanus. These two, and the new partial translation which Federico Commandino published in 1558 and 1565, were the main sources for later sixteenth- and seventeenth-century Archimedean work (Clagett 1978, 568).

Commandino (1558a) contained *On the Measurement of the Circle*, *On Spiral Lines*, *On the Quadrature of the Parabola*, *On Conoids and Spheroids*, and *The Sand Reckoner*, translated directly from Greek manuscripts, with a separate volume of commentaries (Commandino 1558b). Commandino (1565a) was a revised version of the Moerbeke translation of *On Floating Bodies*, which was absent from the *editio princeps* and from available manuscripts. All were much sounder than preceding translations.

Better text versions and printing are one aspect of the novel way the sixteenth century approached Archimedes. Another aspect is the use made of Archimedean theory. Most important in this respect is what was done by Francesco Maurolico and Commandino.

In 1534, Maurolico had composed his own versions of *On the Quadrature of the Parabola*, *On the Measurement of the Circle*, and *On the Sphere and the Cylinder* on the basis of the various direct and indirect medieval traditions combined with information drawn from Valla (Clagett 1978, 773). In *De momentis aequalibus* from 1547 to 1548, he took up the investigation of the centers of gravity of solids (Archimedes had only dealt with those of plane figures). This topic also occupied him later on, and in the 1550s or 1560s, he applied Archimedean

mechanics and medieval impetus theory to the ps.-Aristotelian *Mechanica*.

Commandino, too, was to publish on the centers of gravity of solids in 1565b. Giovanni Battista Benedetti, Guidobaldo del Monte, and Baldi confronted the ways mechanical questions were dealt with by Archimedes, Heron, Pappus, Aristotle, ps.-Aristotle, Jordanus, and impetus theory – sometimes in mutual polemics (Rose 1975, 154–156, 230–233, 249–253).

Knowing the Archimedean texts intimately and using them obviously changed the image of Archimedes among competent mathematicians. This can be illustrated by how Cardano, Commandino, and Baldi spoke about him.

In *Encomium geometriae*, read in the Academia Platina in Milan in 1535, we find (Cardano 1663, 443) after a long list of names of geometers (drawn as far as the minor figures are concerned from Proclus' recently published commentary to *Elements I*) that:

they are all defeated by Archimedes of Syracuse, almost all of whose findings we possess. A man of the highest genius, and who will have shown the circumference of the circle pretty closely, and taught by solid geometry how to interpose two lines between two others in continuous proportion. But that has been lost.

In this context, a praise of geometry, only Archimedes' mathematics finds its place. In *De subtilitate* (Cardano 1550), the situation is different. Book I refers repeatedly to Archimedes in the discussion of mechanical questions; Book IV refers to a book about parabolic burning mirrors (mistakenly) ascribed to Archimedes and to Archimedes setting fire to Roman ships by means of burning mirrors (a story Cardano attributes to Galen). Book XVI, finally, situates Archimedes first in a list of subtle minds (pp. 313f):

not only because of his works which have now been published but also because of his mechanics which, as Plutarch relates in his *Life of Marcellus*, discouraged the Roman troops time and again by his inventions, and discourages us no less by Galen's testimony, in both areas not only the first but inimitable.

Venatorius, in the dedicatory letter introducing his edition of the Greek text, speaks at some length about the mathematics it deals with, but in the end

he also comes to the defense of Syracuse and to Archimedes' promise to move the earth if only he might get another globe.

Both Commandino's translation from 1558 and his commentaries contain dedicatory letters speaking about Archimedes. The former, addressed to Ranuccio Cardinal Farnese (to whose household Commandino belonged since years), first explains that mathematics, dealing with the intelligible only, has higher rank than metaphysics and natural philosophy – these depend on matter, and even Plato and Aristotle cannot agree about them. This higher rank is also to be ascribed to those mathematical disciplines which *contemplate* the sensible: mechanics, astronomy, optics, etc. So, nothing is more useful nor more necessary for the human race than mathematics, neither in private matters nor in public management – not only geometry, arithmetic, and proportion but also mechanics and the preparation of instruments. This leads naturally to Archimedes – first his astronomy and sphere and then arithmetic (*The Sand Reckoner*). Though Archimedes is not known for anything in music, Commandino finds it plausible that he excelled even in this discipline. That he was “a kind of God in geometry nobody sane of mind” can deny. Mechanics he first practiced for war and then transferred to peace – specifically, we hear about the ship, the defense of Syracuse, about Marcellus's grief, and about Cicero finding the grave.

The commentaries are dedicated to the Cardinal's brother-in-law, Duke Farnese. This dedication is much shorter and concentrates on military mathematics (the addressee being a warrior). Later the commentary observes (42^v) that Maurolico is so “skilled in mathematics that in these times he can with justice be said to be another Archimedes.”

Baldi began work on his *Vite de' matematici* in 1575. The biography of Archimedes (from 1595) starts thus (Baldi 1886, 388):

In all domains there have been some who, having arrived at the peak of excellence, have demonstrated how far the human intellect can advance in that direction. Without doubt Archimedes was such a man in mathematics, since the first place is due for good reasons to him.

Baldi builds as much as possible on Archimedes' own introductory letters; but he also draws on Plutarch, Cicero, Ovid, Ptolemy, Pappus, Proclus, etc., confronting them critically with each other. This allows him to present all the usual stories about Archimedes' life and his mechanical feats and also to speak of his surviving works as well as lost writings known from more or less reliable references. In conclusion (p. 453), Commandino is cited for the opinion that “that one can hardly call himself a mathematician who has not studied the works of Archimedes.”

Among the mathematicians of the outgoing Renaissance, Archimedes had thus become primarily a mathematician creating advanced theory; but his fame as most skilled in theoretical as well as practiced mechanics was not discarded. They themselves, often court mathematicians, were also engaged in practical service to prince and state. Their Archimedes was one of their own kind, as had been Taccola's and Brunelleschi's Archimedes in the early fifteenth century – only their kind had changed.

In the Northern Renaissance, references to Archimedes' mathematics are rare and late (none preceding 1530, it seems) and those to the person even fewer. The earliest example of Northern worshipping “Archimедism” is to be found in Petrus Ramus's *Scholae mathematicae* (1569). The presentation of Archimedes begins (p. 26) almost as that of Baldi:

God has decided that there should be in each art something like a unique idea which everybody studying the discipline would propose to himself as a model – as in eloquence, Demosthenes and Cicero, and in medicine Hippocrates and Galen: thus Archimedes in mathematics.

There is no mathematical substance behind this – Ramus' mathematical level hardly allowed him to understand Archimedes in any depth. Ramus' ideological Archimедism did not inspire him to become an Archimedean.

The first Northern figure to approach Archimedean mathematics as mathematics and not only as a small collection of famous results is thus Viète, at the very end of the sixteenth century. In *Apollonius Gallus* and *Variorum de rebus mathematicis responsorum liber VIII*, he makes use of *On Spiral Lines*. When it fitted his mathematical intent, Viète was thus an Archimedean;

however, there is no general praise of the person (not even a presentation) nor of Archimedes as a mathematician. In double contrast to Ramus, Viète, though sometimes Archimedean, was no Archimedeist.

Architect, Renaissance

Elizabeth Merrill

Art and Architectural History, University of Virginia, Charlottesville, VA, USA

Abstract

In Renaissance Europe, the role of the architect was unfixed. Unlike painting, sculpture, and metalwork, where there were organized

systems of apprenticeship, for the architect there was no established curriculum of training or standard mode of practice. Every one of the period's leading architects – individuals like Filippo Brunelleschi, Leon Battista Alberti, Donato Bramante, and Michelangelo Buonarroti – assumed a different role, both in relation to his patrons and in the technical and design work he undertook. As reflected in contemporary commentaries and municipal records, the appellation “*architetto*” was inconsistently used to refer to a range of individuals involved with the building process – from patrons to construction administrators to material suppliers – even when they were not necessarily involved in building design.

Beginning in the fifteenth-century, learned practitioners became increasingly vocal about the need to elevate the status of architecture. Spurred by the rediscovery of Vitruvius' recon-dite *De Architectura*, architecture was recast an intellectual endeavor, requiring science, math, and innate talent (*ingegno*), and as such, was said to belong within the realm of the liberal arts (*artes liberales*). Distinct from the anonymous master masons and building supervisors of the medieval period, the Renaissance architect was to assume the position as authorial, supremely learned master in the art of building. This new conception of the architect was articulated in a series of architectural treatises – those of Leon Battista Alberti, Antonio Averlino “Filarete,” Francesco di Giorgio, and Andrea Palladio, among others – which taking various forms, sought to structure the modern profession.

Synonyms

Architect; Chief of works; Engineer; Mechanic

Defining the Profession

In fifteenth- and sixteenth-century Europe, there was no distinct profession of architecture, and as reflected in the contemporary commentaries, municipal records, building patents, and treatises,

the conception of the architect varied considerably depending on context. Patrons, building administrators, on-site supervisors, and craftsmen often received the appellation “*architetto*” even if they were not necessarily involved in building design. Such was the case with Lorenzo de' Medici, who was often referred to as architect due to his great interest and investment in building (Brown 1993). There are also numerous examples in which an individual who was working as an architect was referred to by another title – painter, sculptor, engineer, or chief of works (*pittore*, *scultore*, *ingegnere*, or *capomaestro*) (Hollingsworth 1984). Luca Fancelli, for example, was accustomed to sign himself “*lapicida*” or “*scultor*” (“stonecutter” or “sculptor”) even when working on building design (Vatovec 1979). Similarly, in his contract for the position of *operaio dei bottini*, overseer of Siena's extensive system of aqueducts, Francesco di Giorgio is designated as *pittore* (Weller 1943).

The undefined nature of the early-modern architect was in part the manifestation of the contemporary cultural shifts and the extraordinary degree of social mobility of the Renaissance period. It was also a product of the desire to impose an idealized, classical conception of architecture on a discipline which for centuries had been ruled by unlettered practitioners. Beginning in the first half of the Quattrocento, learned practitioners and humanists became increasingly vocal about the need to elevate the status of architecture. Leon Battista Alberti was among the first and most notable proponents of this reconception of the profession, writing a theoretical tract which presented architecture as intellectual endeavor, requiring science, math, and *ingegno*, and placing it in the realm of the *artes liberales*. The heightened status of architecture, Alberti asserted, meant that the individual architect also gained prominence. But unlike its sister arts, painting and sculpture, where organized systems of apprenticeship prevailed, there was no established mode of architectural training or even a universally accepted definition of what architecture entailed.

As the first published and widely circulated tract on architecture in the Renaissance, Leon Battista Alberti's *De re aedificatoria* (c.1450) had a marked impact on how architecture was

conceived in the fifteenth- and sixteenth-centuries. Alberti took as his model Vitruvius' *De Architectura* (c.15 BC), the only surviving tract from antiquity dedicated solely to the art of building (Krautheimer 1969). Rediscovered in 1414 by the Florentine humanist Poggio Bracciolini, *De Architectura* was considered the definitive text on architecture in the Renaissance; its abstruse Greek-Latin prose was thought to hold the secrets of superior classical building design. The tract's proposed program – to reformulate Roman architecture, liberating it from what he considered an inferior position in respect to Greek architecture – also resonated with the early-modern practitioners (Pagliara 1986; Vitruvius 1999). Although Alberti did not accept Vitruvius' theory in full, and was considerably less dogmatic on the extreme breadth of the architect's education, he was equally emphatic that the architect was to be distinguished from the craftsman or builder. The architect, according to Alberti, was a learned individual, who used his ingenuity, along with his knowledge of site conditions, building materials, classical building forms, and social practices to conceive and design beautiful structures suitable for the “noble needs of man.” The Albertian architect was all authoritative and controlled the entirety of the building's design. The craftsman, by contrast, was a manual operator, nothing more than the “hand of the architect.” He implemented the building concept but was not involved in questions of design (Alberti 1998).

Alberti supported his lofty vision of the architect using examples drawn from the texts of ancient authorities – not only Vitruvius but also Democritus, Archimedes, Theophrastus, Hippocrates, Servius, Pliny, Plato, and Aristotle, among others. In taking up these models, Alberti gave architecture a learned, theoretical foundation but also one that was highly idealistic and in large part devoid of practical applications. In content and prose, Alberti's erudite Latin *De re aedificatoria* was far better suited for the humanist patron than for the working architect, and ultimately the text had limited impact on fifteenth-century architectural practices.

With few exceptions, architectural design and construction practices in the Renaissance were

largely the same as those of the medieval period. The typical Renaissance architect rose from the ranks of artistic and building trades. Educated in *abbaco*, or practical geometry, he received the appellation of *architetto* late in his career, after demonstrating his excellence in design and his ability to administer and supervise large building projects. Although the architect possessed greater cultural and artistic authority than his artisan peers, his training and skill sets were much the same, and in keeping with the highly conservative, entrenched modes of construction, his work as building designer remained highly collaborative in nature. Rarely, if ever, did the Renaissance architect assume the consummate authority Alberti bestowed upon him (Ackerman 1991; Goldthwaite 1980; Trachtenberg 2010).

Following Alberti, learned architectural practitioners of the fifteenth- and sixteenth-centuries continued to seek to define the diffuse profession. The outpouring of architectural treatises and Vitruvian commentaries written in the vernacular – those of Antonio Averlino Filarete, Francesco di Giorgio Martini, Cesare Cesariano, Pietro Cataneo, Sebastiano Serlio, Andrea Palladio, Philibert de l'Orme, and Vincenzo Scamozzi – reveal the continued desire to bestow order and prestige to architecture where it remained absent (Cataneo 1985, Filarete 1972, L'Orme 1981, Martini 1967, Palladio 1997, Scamozzi 1997, Serlio 1996, Vitruvius 1981). At their core, every one of these tracts questions the essential definition of architecture, offering rules and formulae that might structure the architect's training and practice. Although the books vary considerably in breadth and content, taken together, they uphold a set of fundamental principles. Good architecture, it was unanimously agreed, was that which applied classical building forms and proportions. All the Renaissance authors read Vitruvius, and although like Alberti they may not have followed his theory in full, they all relied upon *De Architectura* in deciphering the difficult parts of architecture (Kanerva 2006; Pagliara 1986). In order to be a successful architect, it was said, it was necessary to study ancient Greek and Roman building models, both in text and firsthand. The Renaissance theorists were also in agreement on the importance of geometry and drawing

(*disegno*). Drawing was considered the fundamental tool of the architect, by which he studied the works of others, developed original designs, tested inventions, and communicated his ideas with workers and patrons. Knowledge of the natural environment, and the ability to modify a building design according to the local topography and site conditions, is another major theme which runs throughout the writings.

In their diversity, the Renaissance treatises testify to the degree to which architecture remained uncoded. There is no consensus, for example, on the dimensions of the columnar orders, and the authors do not agree on a curriculum of architectural education. Moreover, the tracts reveal significant discrepancies in regard to the essential duties and design responsibilities of the architect. Whereas Francesco di Giorgio and Pietro Cataneo assign to the architect projects involving defensive and mechanical design, such technical works are entirely absent from the treatises of Serlio and Palladio (Cataneo 1985, Martini 1967, Palladio 1997, Serlio 1996). The design of fortifications became increasingly specialized in the sixteenth-century, and as delineated in Giovanni Battista Belluzzi's *Trattato di Fortificazioni* (c. 1550), there was an increasing distinction between military and civil architects (Lamberini 2007). For others, however, the diffuse definition of the architect as general "master builder" endured. In Tomaso Garzoni's widely popular *La Piazza Universale di Tutte le Professioni del Mondo* (1585), a text which sought to order all early-modern social functions into distinct professional categories, architects are still defined as "masters of buildings, fortifications and fortresses, and masters of machines, mechanics and engineers" (Garzoni 1996). Over a century after Alberti's *De re Aedificatoria*, therefore, the definition of architecture remained uncertain; the qualifications and duties of the architect still largely determined on a case-by-case basis.

Architecture and Renaissance

Nele De Raedt

Department of Architecture and Urban Planning,
Ghent University, Ghent, Belgium

Abstract

During the Renaissance in Europe, between roughly 1300 and 1650, a number of intellectual discourses and practices helped shape the discipline of architecture. This article is not about canonical buildings or the evolution of distinctive stylistic characteristics but rather six key topics within an overall threefold structure: heritage and rupture with the tradition, innovative and original aspects, and impact and legacy. The six topics are geometry as the scientific foundation of architecture; humanism, antiquarianism, and the recovery of ancient architecture; architectural histories and the creation of an *all'antica* architecture; the canonization of the architectural orders; the production of architectural theory; and *disegno* and the use of architectural drawings. Intellectual history, rather than an art history of styles, is the general approach. It begins with a history of the term “Renaissance” and its application to architecture.

“Renaissance Architecture” Versus “Architecture in the Renaissance”

The idea of the Renaissance as a distinct historical period was formulated during its own time. In the

fourteenth and fifteenth centuries, humanist authors such as Petrarch (1304–1374) and Flavio Biondo (1392–1463) defined the time in which they lived as separate from the immediate past, the Middle Ages (or *Medium Aevum*). In doing so, these writers confirmed that a new epoch in human history had arrived, one that concerned all matters of human life: from science to literature, from politics to art (Günther 2009; Clarke 2003). For the Italian humanists, this concept of a new era coincided with the idea of a rebirth of the culture of classical antiquity. In the sixteenth century, Giorgio Vasari applied these ideas to the visual arts and referred to this rebirth with the word “*rinascita*” (Vasari 1550).

The term “Renaissance” itself, however, was introduced only in the nineteenth century, and specifically with reference to art history (Günther 2009). The French art historian Jean-Baptiste Séroux d’Agincourt (1730–1814) used the term in his *Histoire de l’art par les monumens, depuis sa décadence au IV^e siècle jusqu’à son renouvellement au XVI^e* (written from 1789 onward, published between 1810 and 1823). In this work, Séroux d’Agincourt understood the “Renaissance” as the artistic style of a period, which could be historically demarcated. With a focus on architectural history, he dated the beginning of the Renaissance to the middle of the fifteenth century. In the previous two centuries, he wrote, Italian authors such as Dante, Petrarch, and Boccaccio, along with Greek scholars, had prepared the “triumphant epoch of renewal.” With their work, the human spirit was finally awaking from “its long sleep.” It was only in the fifteenth century, however, that the rediscovery of Vitruvius and the study of ancient ruins revealed the true origins of architecture. Only at this time did the “Renaissance” really begin (Séroux d’Agincourt 1823, III, 86). The period of the Renaissance style in architecture, as understood by him, continued into his own time.

During the nineteenth century, however, art historians revised Séroux’s classification of Renaissance architecture and distinguished Renaissance architecture from Baroque architecture. While Renaissance architecture had previously been distinguished from Gothic

architecture through its use of distinct architectural elements (e.g., classical forms, round arches vs. fine tracery, pointed arches), now it was also differentiated from Baroque architecture through the formal conception and arrangement of the same architectural elements (e.g., static vs. dynamic) (Frommel and Brucculeri 2012; Günther 2009; Wölflin 1915). Within this context, the term “Renaissance” refers more to the formal characteristics of a building than to the historical time period in which the building was built. One can therefore speak of Gothic architecture in France and Renaissance architecture in Italy as being from the same historical moment.

The terms Gothic, Renaissance, and Baroque should thus be understood as modern labels, used to classify and categorize buildings based on stylistic features. There has never been a complete scholarly consensus about the exact definitions of these three terms. Furthermore, the boundary and even distinction between, for example, Gothic and Renaissance architecture has always been a matter of debate. Recently, these very distinctions have received renewed attention within the art historical discipline (Kavaler 2012; Bork 2011; Chatenet 2011).

The debate is related not only to the classification of buildings based on stylistic features, but also to the possibility of creating a sequential art history founded on a model of historically demarcated period styles. This approach to art history was already formulated in the sixteenth century, as were the doubts surrounding it (Sankovitch 2001). In the first edition of the *Vite de’ più eccellenti pittori, scultori e architettori italiani, da Cimbadue insino a’ tempi nostri* (published in 1550), Giorgio Vasari described the art and architecture of his own time as a progressive evolution, following a natural pattern of birth, growth, maturity, and decline. According to this model, he divided recent and contemporary art into three “manners”: the *prima maniera*, the *seconda maniera*, and the *maniera moderna* (Vasari 1550). In the 1568 edition of the *Vite*, however, Vasari revised this strongly teleological system (Vasari 1568). Different styles and artists could and did operate next to one another.

After its introduction into art history, the term “Renaissance” was taken up outside the

discipline. The “Renaissance” was also regarded as a cultural movement, as well as a historical period (e.g., Burckhardt 1860). This widespread appropriation of the term in an interdisciplinary context necessitates its careful and well-defined use. In this entry, “Renaissance” is used specifically to designate the historical period between 1300 and 1650.

Heritage and Rupture with the Tradition

Since antiquity, the standard instruments of the architect had been the straightedge rule and the compass, and this remained largely so during the period under consideration. Geometry was the most important mathematical discipline for architecture, both in theoretical discourse and in design and building practices. Toward the end of the sixteenth century, the dominance of geometry would be challenged when calculation by number entered architectural practice. Architects studied and wrote on geometry and included geometrical rules and formulae in their treatises on architecture; they also made contributions to the field of applied mathematics. By drawing attention to the interconnection between architecture and geometry, architects also tried to demonstrate the rational basis of their discipline.

During the thirteenth and fourteenth century, admiration for the culture of the ancients steadily grew in Europe – in Italy, France, and Spain in particular. In these places, physical traces of antiquity, whether textual or architectural, had never completely disappeared. Yet from the fourteenth and fifteenth century onward, architects, artists, and humanists changed their approach to these physical remains. Based on the careful study of ancient buildings and written texts, architects started to develop a new architectural language, creating forms that would be used until the twentieth century. Tradition thus became the catalyst for creation and innovation. The study of antiquity also encouraged the historical awareness of architecture as a discipline. Beginning in the fifteenth century, an unprecedented literature on architecture developed, taking the form of written histories, commentaries, and treatises.

Having found in Vitruvius a model, Renaissance authors began to write on architecture in all its aspects. Defining the creation of buildings as a mental practice, these treatises contributed to the concept of architecture as a theoretical and intellectual endeavor. The architectural project, illustrated and communicated in drawings and models, assumed autonomy.

Innovative and Original Aspects

Geometry as the Scientific Foundation of Architecture

In *De architectura libri decem*, written around 15 BC, Marcus Vitruvius Pollio (c. 80/70–c. 15 BC) argued that architecture is founded in both practice and theory, in *fabrica* and *ratiocinatio*. An architect needs the artisan’s knowledge to mold the rough material into a complete building. Architecture is also, however, a rational activity. To perform their profession well, architects should study all the liberal arts (Pauwels 2012; Evers and Thoenes 2003; Payne 1999). Yet among the liberal arts, Vitruvius privileged mathematics, and specifically geometry, as fundamental to architecture (Pauwels 2012).

This close connection between architecture and geometry continued during the Middle Ages and was expanded on between 1300 and 1650. Antonio Averlino (c.1400–c.1469), better known as Filarete, defined architecture, in his *Libro architetonico* (c. 1461–1464), as comprising measurement and proportion. Albrecht Dürer (1471–1529) applied the principles of geometry to architecture, engineering, and typography in the third book of *Unterweysung der Messung mit dem Zirckel und Richtscheit*, published in 1525. In his *Premier tome de l’architecture*, published in 1567, Philibert de L’Orme (1514–1570) stressed the importance of geometrical knowledge for stereometry – that is, the science of measuring the volume of solid objects (Figs. 1 and 2).

Collaborations between mathematicians and architects also led to advancements in both fields (Günther 2009). Filippo Brunelleschi

Architecture and Renaissance, Fig. 1 Illustrating the construction of a column through geometrical principles. (Albrecht Dürer. 1538. *Underweysung der Messung, mit dem Zirckel und richtscheyt, in Linien, Ebenen und gantzen Corporen*. [Nürnberg]: [Formschneider]. 90. doi: 10.3931/e-rara-8271. ETH-Bibliothek Zürich, Alte und Seltene Drucke)

(1337–1446) was acquainted with the mathematician Giovanni dell’Abbaco (1354/1371–c. 1440), who most probably advised him in developing the revolutionary construction technique for the cupola of Santa Maria del Fiore in Florence. Furthermore, at the beginning of the fifteenth century, there was a growing desire to grasp the visual world, to depict what is seen in a mimetic way, among a group of artists in Florence. In this context, Filippo Brunelleschi studied the geometrical structure of the conical pyramid, the laws of which had been identified by Roger Bacon around 1260–1270. This enabled him to identify linear perspective and illustrate it in two panels (now

lost) (Trachtenberg 2010; Günther 2009). This identification of linear perspective further revolutionized the way in which architectural structures could be represented on a two-dimensional surface.

The relation between geometry and architecture also extended to a more metaphysical level (Evers and Thoenes 2003). Plato’s geometry was one of the most important models of the universe, handed down from antiquity through the Middle Ages via a late ancient Latin translation of the *Timaeus*. According to Plato’s cosmology, a creator had used mathematical laws to transform the world from a state of chaos to a state of order. This resulted in a universal harmony, in which each part was in proportion to the others and to a larger whole. Pythagorean number theory further showed that numbers pervaded every part of the universe. Their strong reciprocal relations seemed to bind the universe together in a state of stability (Hiscock 2007).

In certain cases, the relationship between measurement, proportion, and universal harmony was made explicit in literature dealing with architecture. In *De re aedificatoria* (written between 1443 and 1452, first published in 1485) Leon Battista Alberti (1404–1472) based his proportional system on musical proportions. Luca Pacioli (c. 1445–1517) included architectural topics in his *De divina proportione* (composed around 1498, first printed in 1509). In Milan, Pacioli collaborated with Leonardo da Vinci (1452–1519), who drew the polyhedra for *De divina proportione*.

Both on the building site and in making drawings on paper, geometry was fundamental to architecture (Bork 2011; Trachtenberg 2010). During the sixteenth century, however, architects also started to calculate with numbers. At this time, modern numeracy spread rapidly across Europe in all domains of life (Carpo 2003). Giacomo Barozzi da Vignola (1507–1573) inserted proportional measurements, written in Hindu-Arabic numbers, in the images of his *Regola delli cinque ordini d’architettura* (c. 1562–1563). Andrea Palladio (1508–1580) applied the same technique in his *Quattro libri dell’architettura* (1570). The adoption of this new

Architecture and Renaissance, Fig. 2 Principles of stereometry for the construction of a spherical vault (Philibert De l'Orme. 1567. *Le premier tome de*

l'architecture. Paris: chez Federic Morel. Book IV, 113. doi: 10.3931/e-rara-15,161. Universitätsbibliothek Bern)

system in architecture seemed rather slow. In certain cases, calculation by number was met with outright hostility. As late as 1641, Carlo Cesare Osio (b. 1612) published *Architettura civile*, in which he attempted to return architecture to a state of pure geometry, without the use of numbers (Carpo 2003; Fig. 3).

Humanism, Antiquarianism, and the Recovery of Ancient Architecture

Although admiration for ancient culture had steadily grown from the thirteenth century onward, the study of ancient architecture and the creation of *all'antica* architectural forms – that is, those in the ancient manner, specifically of the Romans – began only in the fifteenth century. This study of ancient architecture took place on both a textual and archaeological level. The process of discovery, moreover, was a joint endeavor, as humanists, writers, artists, and architects all collaborated in this study of the ancient past (Günther 2009; Clarke 2003; Payne 1999; Smith 1992).

A central text in this process was Vitruvius' *De architectura libri decem*. Under the influence of Italian humanism, this treatise gained renewed

attention at the beginning of the fifteenth century. Using a new philological approach to ancient texts, Italian humanists critically edited and translated the manuscripts they found in monastic libraries. In this context, Poggio Bracciolini (1380–1459) “rediscovered” Vitruvius' treatise in 1414 at the Abbey of St. Gallen in Switzerland (Günther 2009; Clarke 2003; Payne 1999).

In the fifteenth century, Vitruvius' treatise attracted the attention of both humanists such as Leon Battista Alberti and architects such as Lorenzo Ghiberti (1378–1455), Filarete, and Francesco di Giorgio Martini (1439–1502). But given the state of the treatise – which was incomplete, often unclear in its descriptions, and written in a combination of highly technical Latin and Greek – humanist scholars were better equipped to read and interpret the text. Furthermore, the images that originally accompanied the texts were lost (Günther 2009; Clarke 2003; Payne 1999).

Fifteenth-century enthusiasm for Vitruvius' work was due not only to its renown as a text recovered from antiquity but also to its potential to grant authority to contemporaries to discuss a wide variety of relevant architectural topics. As an

Architecture and Renaissance, Fig. 3 The introduction of fractures with Hindu-Arabic numerals to illustrate the construction of the ionic capital. (Giacomo Barozzi da Vignola. 1607. *Regola delli cinque ordini d'architettura*. Rome: Andreas Vaccarius. 43. doi: 10.3931/e-rara-9949. ETH-Bibliothek Zürich, Alte und Seltene Drucke)

extensive, ten-book treatise, it included such topics as the visual representation of buildings, construction techniques, proportion systems, the proper design of building types, as well as ornamental features. By the second half of the fifteenth century, Vitruvius' text also increasingly served as the model for new writings on architecture, as will be discussed later. Although architects often disagreed about the accuracy of Vitruvius' pronouncements, the ancient treatise was indisputably effective as an expository model. It showed that architecture was an intellectual discipline and a topic worthy of theoretical reflection.

By the mid-fifteenth-century, patrons and scholars all over Italy, as well as ecclesiastical librarians, copied and owned manuscripts of the treatise (Clarke 2003). From the 1470s onward, this study and interpretation of *De architectura* intensified. In 1486, the *editio princeps* was published under the supervision of Giovanni Sulpizio da Veroli (fl. c. 1470–1490). In 1511, Fra Giovanni Giocondo da Verona (1433–1515) printed the first illustrated edition in Venice. Ten years later, the first Italian translation by Cesare Cesariano (1476/1478–1543) was published in Como. Another authoritative Italian edition was published in 1556, with a commentary by Daniele Barbaro (1514–1570) and illustrations by Andrea Palladio. From the sixteenth century onward, the treatise became available in other European languages. In 1547, a French edition by Jean Martin (d. 1553), with illustrations by Jean Goujon (c. 1515–1564/1568), was published in Paris. One year later, Walther Ryff (c. 1500–1548) brought out the first German edition. In 1582, a Spanish edition followed (Evers and Thoenes 2003; Payne 1999; Figs. 4 and 5).

While Vitruvius' *De architectura libri decem* was an important written source on ancient architecture, it was not the only text humanists and architects consulted. Pliny the Elder's *Natural History* (written in the first century AD), for example, was studied widely by humanists, artists, and architects for his detailed descriptions of ancient architectural wonders, as well as his elaborations on construction materials and ornamental features (Fane-Saunders 2016).

In addition to textual analysis, humanists and architects studied ruins to recover knowledge of ancient architecture. In the fifteenth century, humanists started to collect and record ancient inscriptions. They tried to classify ruins historically, as well as to identify the location of buildings they read about in ancient texts. Their detailed studies resulted in descriptions of ancient Rome, including *De varietate fortunae* by Poggio Bracciolini and *Roma instaurata* by Flavio Biondo (1392–1463). Architects, on the other hand, focused on the architectural characteristics of the fragments, such as their structural composition and ornamental features. In many cases,

Architecture and Renaissance, Fig. 4 Title page of Fra Giocondo's illustrated edition of Vitruvius's *Architectura Libri Decem*. (Giovanni Giocondo. 1511. *M. Vitruvius per Iocundum solito castigatio factus...* Venice: Tacuino. Title page. doi: 10.3931/e-rara-19,439. Stiftung Bibliothek Werner Oechslin)

however, the pursuits of humanists and architects intersected (Günther 2009; Clarke 2003). In his famous letter to Leo X (1475–1521; r. 1513–1521), for example, Raphael (1483–1520) encouraged the pope to preserve, measure, and draw the buildings of ancient Rome. In the end, the final goal was the revival of ancient architecture and its realization in contemporary practice (Sankovitch 2001; Nagel and Wood 2005).

Studies of ancient fragments of columns, capitals, bases, and cornices, surviving in ruins or as *spolia*, were documented on paper. Continuously copied, these images facilitated the wide dissemination of knowledge about ancient fragments, communicating different types of information from what was contained in written texts. The

attention to clear and precise measurement and representation in these drawings varied greatly. While some studies tried to be as exact as possible in terms of the measurements and forms they represented, others took on a more imaginative aspect. With the advent of the printing press, single-sheet engravings further disseminated the wide variety of ornamental possibilities (Waters 2012).

Architectural Histories and the Diversity of all'antica Architecture

Along with the study of ancient buildings through texts and ruins, the idea that architecture was a discipline with its own history began to take form (Günther 2009). In Italy, this history of architecture was conceptualized and written down by numerous authors, each of whom adopted his own approach. Alberti, for example, saw the origins of the art of building in Greek culture. The Greeks had recognized that architecture was based on rules and had applied these rules in their buildings. The Romans, Alberti argued, had then developed this art of building to its fullest potential (Alberti 1988). But despite differences between Alberti's history and the histories put forward by Antonio Manetti (1423–1497) and Giorgio Vasari, for example, the main narratives assumed by early modern architectural historians were usually the same. They generally agreed that good architecture had flourished under the Romans. How long it continued to flourish, however, was a matter of controversy. Most thought until the reign of Constantine (c. 305–337), but some extended it further. Nevertheless, everyone held that the invasion of the Germanic tribes in Italy (fifth to eighth century) had marked the end of good architecture, as well as the necessary knowledge of construction. Only when Charlemagne liberated the Italians from German rule in the eighth century was the art of building slowly but surely restored (Günther 2009; Sankovitch 2001).

While the architectural forms imported under German rule were harshly criticized in Italy, the notions “Gothic,” “German,” and “modern” were neither uniform nor clearly defined. Likewise, authors applied the word “modern” differently. Filarete begged his contemporaries to abandon

Architecture and Renaissance, Fig. 5 The Vitruvian Man in Cesare Cesariano's illustrated and Italian edition of Vitruvius's treatise (Cesare Cesariano. 1521. *Di Lucio*

Vitruvio Pollione de architectura libri dece. Como: Gotardus de Ponte. Book III, Llr. doi: 10.3931/e-rara-19,393. Stiftung Bibliothek Werner Oechslin)

“modern usage,” for “only barbaric people could have brought it into Italy” (Filarete 1965). Vasari stated that the ancient and modern manner (*maniera dell’antica e moderna*) was “virile, solid and simple.” The German manner (*maniera tedesca*), on the other hand, was “monstrous and barbarous,” “with columns that are thin and twisted like vines and do not have the strength to bear a load, no matter how light” (Sankovitch 2001; Vasari 1568). Not all Italians criticized this foreign method of design. Occasionally, expressions of enthusiasm and admiration for German architecture appear. Pope Pius II (1405–1464) even ordered that the cathedral in Pienza be built on the model of the German Hallenkirche (c. 1459–1464).

On the other side of the Alps, the French similarly established their own definition of good architecture. Here, the adoption of Italian architectural forms was initially (and, in a certain sense, would continue to be) met with suspicion. French architects and theorists stressed the boldness and

lightness of their own architectural structures, testing the architectural references they employed against these characteristics; for example, French theorists often presented Hagia Sophia, rather than the Pantheon, as an example of good architecture (Günther 2009).

In their recovery of true architecture (constructed in Roman times and since the liberation from German rule), Italian architects viewed both ancient and local Romanesque buildings as models for contemporary practice. This is because, on the one hand, it was not yet possible to differentiate an antique from a Romanesque building based on stylistic characteristics. When the exact date of a building was in doubt, historical, iconographic, or technical arguments rather than stylistic characteristics were used (Clarke 2003, Smith 1992). On the other hand, even when it was known that a building was constructed during the Middle Ages, it could still serve as a model because it was seen as the result of ancient tradition (Nagel and Wood 2005;

Clarke 2003). Brunelleschi thus studied both the Pantheon in Rome (c. 118–128) and the church of San Miniato al Monte in Florence (c. 1018–1062) as exemplary architectural models.

This emphasis on local traditions, together with traditional building practices (material, techniques, and so on) gave rise to a variety of *all'antica* forms in Europe, even within Italy. In Venice, the adoption of Byzantine elements emphasized the cosmopolitan character of the city. In Bologna, the traditional use of terracotta gave the city its specific red color. In Florence, the geometrical patterns of the façades of the cathedral baptistery and the church of San Miniato al Monte inspired architects to use various colored marbles. But in the sixteenth century, with the canonization of the architectural orders, a certain standardization and unification of *all'antica* forms began to take shape throughout Italy and beyond.

The Canonization of the Architectural Orders

By the beginning of the sixteenth century, as the study of Vitruvius and of ancient ruins progressed, the discrepancies between them became ever more obvious. In Rome, architects began to classify, systematize, and ultimately canonize ancient fragments. The contributions of Donato Bramante (1444–1514), Raphael, Baldassare Peruzzi (1481–1536), and Antonio da Sangallo the Younger (1485–1546) gave rise to the concept of the architectural orders (Waters 2012; Payne 1999; Thoenes and Günther 1985). In the formulation of the architectural orders, the constituent parts, the ornament, and proportions of the columnar system were systematically defined. In the illustrated edition of Vitruvius' *De architectura*, Cesare Cesariano represented individual columns with their ornamental features on a single page.

Architectural treatises contributed to the codification of the architectural orders. Sebastiano Serlio (1475–1553/1555) wrote several books on architecture, published in Venice, Paris, and Lyon, between 1537 and 1575 (Evers and Thoenes 2003; Payne 1999). In 1619, all these books were assembled and printed in Venice under the title *Tutte l'opere d'architettura et prospettiva di Sebastiano Serlio bolognese*. Book IV, *Regole generali di architettura sopra le cinque maniere*

degli edifici, printed in Venice in 1537, was the first systematic treatment of the five architectural orders (*maniere*) in a printed work. Based on his study of Vitruvius, ancient ruins, and contemporary practice, Serlio organized the orders into five coherent systems: Doric, Ionic, Corinthian, Tuscan, and Composite (Fig. 6). In Book VII of *Le premier tome de l'architecture*, printed in Paris in 1567, Philibert de l'Orme added a sixth architectural order to Serlio's "cinque maniere" (Evers and Thoenes 2003): the French order. De l'Orme's invention is a precursor to the vehement seventeenth-century debates about the existence of a typical French order.

Giacomo Barozzi da Vignola's introduced the term "order" in his *Regola delli cinque ordini d'architettura*, first printed in Rome in 1562

Architecture and Renaissance, Fig. 6 The five ways (*maniere*) of building by Sebastiano Serlio. (Sebastiano Serlio. [1584]. *Tutte l'opere d'architettura di Sebastiano Serlio*. Venice: apresso Francesco de'Franceschi. Book IV, 127r. doi: 10.3931/e-rara-26,987. ETH-Bibliothek Zürich, Alte und Seltene Drucke)

Architecture and Renaissance, Fig. 7 The five orders of the columns by Iacomo Barozzi da Vignola (Giacomo Barozzi da Vignola. 1607. *Regola delli cinque ordini d'architettura*. Rome: Andreas Vaccarius. 11. doi: 10.3931/e-rara-9949. ETH-Bibliothek Zürich, Alte und Seltene Drucke)

(Fig. 7). Appearing in more than 250 editions, Vignola's *Regola delli cinque ordini* was the most authoritative text on the architectural orders until the beginning of the twentieth century (Evers and Thoenes 2003; Carpo 2003). Printed with copper plates, the illustrations took center stage, with the text reduced to the minimum. Concerning proportion in the architectural orders, Vignola's contribution was to deduct the standard module from the building's height, using modern methods of calculation; previous authors had mainly worked up from the diameter of the column using geometrical procedures.

Building and Writing: The Textual Production on Architecture

The architectural orders, however, were just one out of many topics addressed in architectural treatises, a literary genre in which architecture itself was the main topic of discussion. The form, content, length, language, and use of images could vary greatly in such treatises, as did the readership addressed – from patrons and humanists to fellow architects and craftsmen. As written texts (whether illustrated or not), they created both a theoretical framework and a language with which to discuss architecture. The production of architectural treatises was closely connected with the position of architects in society and their attempt to ennoble the profession. The goal of such treatises was to differentiate architects from artisans, as well as to associate architecture with the liberal rather than the mechanical arts.

Alberti's *De re aedificatoria* is generally considered to be the first architectural treatise of the Renaissance (Evers and Thoenes 2003; Payne 1999; Alberti 1988). Written in Latin between 1442 and 1452, and without illustrations, Alberti presents his theory of architecture based on his personal study of Vitruvius and of ancient ruins. With its attempt to establish the rules of architecture and to prove its rational basis, the treatise addressed a learned readership rather than practicing architects. The treatise was immediately received as an authoritative text (Fig. 8).

Between 1461 and 1464, Filarete produced his *Libro architetonico* (Evers and Thoenes 2003; Filarete 1965). Using the dialogue format, Filarete handles three topics: the general outline of his architectural theory, the planning and construction of the fictional city of Sforzinda, and the description of real and imaginary ancient buildings. Written in Italian and partially illustrated, the treatise addressed a different readership from *De re aedificatoria*. Although the autograph version of the text has been lost, a number of manuscript copies, such as the Sforza group (Codex Trivulzianus, Codex Palatinus) and the Medici group (Codex Magliabechiano, Codex Valencianus), still survive.

Francesco di Giorgio Martini wrote his *Trattato di architettura* between 1475 and 1495

Architecture and Renaissance, Fig. 8 Title page of the Italian translation of Alberti's *De re aedificatoria*. (Leon Battista Alberti. 1550. *L'architettura di Leonbattista Alberti*. Florence: appresso Lorenzo Torrentino. Title page. doi: 10.3931/e-rara-770. ETH-Bibliothek Zürich, Alte und Seltene Drucke)

(Merrill 2013; Evers and Thoenes 2003; Payne 1999). Like Filarete's treatise, it was written in Italian and fully illustrated. In it, Francesco di Giorgio defined architecture as a scientific discipline, founded on arithmetic and geometry. Although the treatise remained unpublished, it was reproduced in hundreds of manuscripts and became a standard reference work in Italy by the end of the fifteenth century.

The production of architectural treatises intensified in the following century. The many authors include Sebastiano Serlio, Giacomo Barozzi da Vignola, Pietro Cataneo (c.1510–c.1571), Andrea Palladio and Vincenzo Scamozzi (1548–1616) in Italy; Philibert de l'Orme and Jacques Androuet du Cerceau (c.1521–c. 1568) in France; Diego de

Sagredo (first half of the sixteenth century) and Juan Bautista Villalpando (1552–1608) in Spain; John Shute (d. 1563) and Henry Wotton (1568–1639) in England; and Albrecht Dürer, Hans Blum (b. c. 1520/1530) and Hans Vredeman de Vries (1526–1609) in Germany and Northern Europe.

Vincenzo Scamozzi's *L'idea dell'architettura universale*, printed in 1615, can be considered as the last treatise of the Renaissance in which architecture is portrayed as a universal science encompassing all domains of life (Evers and Thoenes 2003; Payne 1999). As with many of his ideas, he turned to Neoplatonism to justify this claim. According to this philosophy, God had created a mathematically and geometrically ordered cosmos, in which each element was related to every other one as well as to the larger whole. Created in the image of God, the human body and its proportions gave access to these universal laws and rules of the universe. The ideal proportions for architecture could thus be found in the human body. Despite Scamozzi's attempt to write a universal theory of architecture, it was Book VI, on the architectural orders, that had the most lasting influence; from 1657 onward, it also appeared separately, in a shortened version.

Although these architectural treatises are presented here, for reasons of clarity, as isolated works, they often complemented a wider *oeuvre* of writings by the same author. Alberti wrote *De re aedificatoria* after the publication of his *De pictura* (1435, in Italian 1436), *De statua* (date unknown), and many other works. Cataneo wrote both a treatise on architecture (*I quattro primi libri di architettura*, 1554) and another on applied geometry (*Pratiche delle due prime mathematiche*, 1559), and Dürer wrote treatises on the application of geometry to architecture (*Underweysung der Messung mit dem Zirckel und Richtscheyt*, 1525), military architecture (*Etliche underricht, zu befestigung der Stett, Schloss, und flecken*, 1527), and human proportion (*Vier Bücher von menschlicher Proportion*, published posthumously, 1528). Furthermore, the architectural treatise was merely one of the genres in which topics related to architecture were discussed. From the second half of the fifteenth

century, written and drawn studies of machines, ancient fragments, military devices, human bodies, and geometrical patterns proliferated, all of which testify to the wide cultural field in which architecture was involved at the time. Biblical exegesis, military science, and discourses on agriculture, among others, influenced ideas and precepts about building typologies and established a variety of interconnections between building theory and practice.

Design as a Mental Practice and the Use of Architectural Drawings

The use of drawings in architectural design processes has a long history. The ancient Egyptians, Greeks, and Romans most likely employed drawings in planning their pyramids and temples. The same assumption applies to the builders of the early Middle Ages. From the thirteenth and fourteenth century onward, the use of drawings in the design process is well documented. The surviving drawings mostly relate to the design of the complex stone structures of monumental churches and cathedrals (Bork 2011; Hubert 2005). The earliest of these are of French origin (Villard Honnecourt's Sketchbook, c. 1235 and the Reims Palimpsest, 1240–1260) (Bork 2011). Parallel with this corpus of design drawings, the professional definition of the architect as a skilled craftsman underwent considerable change. To design through drawing became the architect's specialized skill (Hubert 2005).

The corpus of surviving architectural drawings increases considerably from the fifteenth century onward. This is, in part, explained by technological achievements. During the Middle Ages, drawing was often ephemeral, completed either on mobile supports, such as parchment or wooden tablets which could be erased and reused, or on the building surface itself (Bork 2011; Günther 2009; Hubert 2005). Although paper had been produced in Europe since the twelfth century, it only became widely available in the fifteenth century. As a cheaper alternative to parchment, and as a long-lasting material support, paper offered great potential for architects. Its portability also allowed the wide dissemination of drawings, increasing

communication on and transmission of design concepts. By the sixteenth century, paper was the material support of choice for the design of new structures, as well as for the documentation of ancient ruins, anatomical studies, and multiple forms of graphic experimentation. Bramante's designs for St. Peter's in Rome are among the first design drawings on paper that are still extant (from 1505 to 1506) (Günther 2009; Hubert 2005).

At the same time that paper became increasingly available, the study of Vitruvius, the discovery of linear perspective, and the learned discourses in architectural treatises together encouraged theoretical reflection on and discussion of architectural representation (Hubert 2005). This development was also related to the study and documentation of ancient ruins. In the fifteenth and sixteenth centuries, architects devised new representational techniques to document buildings completely and objectively (Günther 2009; Clarke 2003; Payne 1999). Raphael proposed one such system of graphic codification in his letter to Leo X. By means of the orthogonal projections of the plan, elevation, and section, he would document the (for the most part) lost buildings of ancient Rome.

Theoretical reflections in Italy were also concerned with the role of drawing in the architect's creative process (Caye 2008/09). In his *De re aedificatoria*, Alberti described the architect's design process as a mental activity. According to him, the architect should conceive the building in his mind before construction and entirely abstracted from any material form. Drawings and three-dimensional models are the means by which this mental image takes visual, tangible form (Trachtenberg 2010; Caye 2008/09; Alberti 1988). In his *Libro architetonico*, Filarete described the steps by which the mental image is translated into physical reality: from initial drafts, followed by more detailed sketches, to plans in scale, and finally the architectural model (Caye 2008/09; Filarete 1965). Between the architectural projects conceived in the artist's mind and the actual built structure, therefore, stood the architectural drawing and the model (Caye 2008/09, Millon and Lampugnani 1994).

Such discussions about the use of drawings in the creative process were related to cognitive psychology. In *Metaphysics*, Aristotle had formulated the idea that the outline of a creation preexists in the artist's mind before being transformed into matter (Caye 2008/09). Beginning in the fifteenth century, theorizing about this process and about related concepts (e.g., *ingenium*, *inventio*, and *disegno*) took on an ever growing importance, not only in painting and sculpture but also in architecture. A central figure was again Vasari. He understood *disegno* as an intellectual construct based on judgement and expressed through the work of the hand; *disegno* was understood as “a word of the mind as much as a word of the hand” (Didi-Huberman 2005: 78). In 1563, the academy of the *Arti del disegno* was established in Florence. For the first time, the three arts of *disegno* (architecture, sculpture, and painting) were brought together in an institutional setting.

Impact and Legacy

The study of ancient fragments and texts, together with scientific and graphical experiments, led to the introduction of a new formal language in architecture. The architectural orders were not only codified and transmitted by a wide variety of textual and graphical means, they also became the defining constitutive elements of architectural design for at least four centuries. While the twentieth century saw a profound change in the formal language of architecture, the means to create form largely remained the same as in the Renaissance. Architects still used pencil and paper to translate architectural ideas into visual form. Plans, sections, and elevations, using the orthogonal projection, as well as perspectival drawings and models, continued to be the general formats for designing and communicating architectural ideas. It was not until the 1960s and 1970s, with the emergence of digital means, that design and communication instruments experienced a new revolution. The Renaissance also witnessed the rise of ideal cities, the first notions of landscape design, and the development of distinct building typologies. It produced thorough discussions of the social and

political importance of architecture, as well as its ethical implications. The design of machines, as well as military devices and structures, very often belonged to the architect's portfolio. Such topics have not been addressed here, but they contributed, together with the six themes discussed, to the development of the architectural discipline during the Renaissance.

Abstract

John Argyropoulos was a famous Greek scholar of the fifteenth century, whose contribution in classical letters and philosophy was praised by his fellow humanists. He shared his time between Constantinople, Crete, mainland Greece, Italy, and other European countries. Argyropoulos' career in Constantinople and Italy was remarkable, as his teaching and broader scientific activities in both these places were admirable and of top quality. Argyropoulos was a leading fifteenth-century Aristotelian philosopher. His research focused on Aristotle's natural philosophy and ethics.

Biography

John Argyropoulos was born in Constantinople or in Crete. His date of birth is dubious, although modern scholarship accepts 1393–1394 as the most probable year of his birth. Instead John Monfasani proposed 1405 as the year of his birth. Older sources placed his birth in 1410 or 1415; according to a dubious epistle, he was 76 when he died. His family was wealthy and respectable in Constantinople. Argyropoulos' parents died when he was a child and his relatives

sent him to Salonika to study under Alexios Phorvinos, a famous teacher. A few years later he returned to Constantinople and continued his studies under John Chortasmenos (1370–1437), an ardent philosopher, mathematician, and astronomer. In a letter to Georgius Trapezuntius (1395–1472), a Cretan scholar who made a considerable career in Italy, Argyropoulos praised the famous teachers of his youth, who instructed him ancient wisdom. It is possible that Georgius Gemistus Pletho (1355–1454) was among Argyropoulos' teachers. During the 1420s – probably 1424 – Argyropoulos moved to Crete, although he claimed that he was already a successful scholar in Constantinople. There, he engaged in a dispute with Georgius Trapezuntius. At times, Argyropoulos and Trapezuntius worked as tutors in Crete. In 1425, Emperor Manuel II Paleologus assigned him the direction of a public school in Constantinople. Within the same year, he became a priest and was appointed as an imperial judge. According to the historian Ducas, Argyropoulos participated in the Council of Ferrara – Florence (1438–1439), although his role in the Council was not crucial. For the rest of his life, Argyropoulos remained a pro-unionist and at a later point he probably converted to Catholicism. After the end of the Council, Argyropoulos probably returned to Constantinople with the rest of the Byzantine delegates and continued his teaching activities. Among his students was Francesco Filelfo's (1398–1481) son. The Italian humanist lived in Constantinople and worked in the emperor's court. Filelfo entrusted his son to Argyropoulos because the latter's reputation as a scholar was high in Byzantium and Italy. Around the same time, he wrote the *Comedy of Katablattas*, a very interesting text in which he gave useful information about his personal life. Specifically, he ridiculed Demetrios Katadokeinos or Katadoukinos who was a judge in Constantinople. Katadokeinos accused Argyropoulos of impiety and atheism. Argyropoulos was brilliant enough to reply indirectly in order to doubt Katadokeinos' integrity and moral status. It is possible that the serious accusations against him forced him to leave his successful teaching career and seek his fortune in Italy. In 1441, he traveled

to Italy and settled in Padua. He became the protégé of Palla Strozzi (1372–1462), a Florentine exile in Padua who was interested in ancient Greek language and culture. With the aid of Andronicus Callistus (1400–1486) – another Greek humanist who built his career in Italy – Argyropoulos taught the youth and elder citizens of the city Greek language and philosophy. Palla's support was crucial for Argyropoulos, since Palla was wealthy and influential. During his stay in Italy, he studied philosophy and medicine at the University of Padua and in 1444 he obtained the degree of doctor from the same University. Despite his career and reputation in Constantinople, Argyropoulos thought that it would be useful for his future plans to have studied in one of the best European universities. It seems probable that he planned to move to Italy even before the fall of Constantinople. After the completion of his studies in Padua, he returned to Constantinople and to his students. Among them, we should distinguish Constantine Laskaris (1434–1501), Michael Apostolis (1422–1478), Antonios Pyropoulos, Manuel Pyropoulos, John Panaretos, Demetrius Angelos, and others. Argyropoulos mentioned that even people from Italy came to attend his lessons. He taught Aristotelian logic, Galenic medicine, and philosophy of nature at the Xenon of Kral. He was a leading figure in a circle of physicians at Constantinople. Moreover, there are several testimonies that Argyropoulos was also a successful copyist. Before the final Turkish siege of Constantinople, Argyropoulos accompanied Cardinal Isidore to his delegation to Pope Nicholas V. Cardinal Isidore worked as a mediator between the Orthodox and the Catholic Church in order to reinforce the Byzantine army against the Turks. Besides the Catholic Church and the Western Christian leaders, Argyropoulos sought the salvation of the empire in classical heritage, a possible aura of Pletho's influence on him. Namely, he exhorted the last Byzantine Emperor Constantine XI Paleologus to proclaim himself King of the Hellenes. Argyropoulos wrote an oration entitled *Basilikos e peri basileias* in which he grabbed the chance to declare his political views and exhort the emperor to seek help in Western Europe. Argyropoulos held that kingship was the

best form of government. In order to strengthen his views, he resorted to arguments taken from ancient Greek philosophical texts. According to the correspondence between the Pope and his prelates in Constantinople, Argyropoulos was an active pro-unionist in the last days of the Byzantine Empire. As a result of the fall of Constantinople, Argyropoulos lost his possessions and his family was captured. He was obliged to spend the next 3 or 4 years collecting money so as to set his family free. It was a really difficult period for him because simultaneously he was trying to find a job in Italy and move there. During a trip to Italy, he was introduced to Donato Acciaiuoli (1429–1478), a relative of Argyropoulos' patron Palla Strozzi. Acciaiuoli encouraged him to submit his candidacy for a professorship at the Florentine Studium. Although his candidacy was not accepted with excitement since the local authorities preferred a native Italian for the position, his supporters in Florence were able to assure his election as professor of Greek language and philosophy in 1456. Meanwhile, Argyropoulos visited Pope Calixtus III (1378–1458) as a delegate of Thomas Paleologus (1409/10–1465) – the despot of Mystra, who aspired to get aid from the Europeans in order to defend Peloponnese from the Turks. From Rome, he headed to Milan, where he met the Sforza family, France, and England. Besides his mission, it is probable that he sought support in order to reunite and liberate his family which remained captive. Before his installation in Florence, he visited Greece and managed to bring his family to Italy. Argyropoulos started to give his lectures in 1457. Instead of the standard Italian humanistic preference of rhetoric and *bene dicendi*, Argyropoulos chose a more philosophical approach because he insisted on the superiority of philosophy, especially metaphysics and philosophy of nature. He instructed his students Aristotelian Ethics and Politics; then he taught the *De anima* and lectured on physics and metaphysics. In addition to his morning courses, he taught private lessons to selected students in the afternoon at his home. In these private lessons, he expounded Aristotelian logic and even Platonic dialogues, such as the *Menon*. There are several testimonies that his lectures on Plato were of

extraordinary quality. Argyropoulos managed to stay for the most neutral in the heated debate between Renaissance Platonists and Aristotelians concerning the philosophical primacy of either one. He held that the philosophy of Plato and of Aristotle do not differ so much, let the fact that their differences are fruitful for philosophy in the broader sense. He was so friendly to Plato that even Michael Apostolis thought of him as a Platonist and admirer of Georgius Gemistus Pletho. The students accepted with enthusiasm his approach and soon Argyropoulos became extremely popular and influential in Florence. The Florentine youth sought his teaching and guidance. Among his most illustrious students, we mention Vespasiano da Bisticci, Donato Acciaiuoli, Bernardo Platina, Alamanno Rinuccini, and Angelo Poliziano. Besides his teaching activities, Argyropoulos was an excellent translator. He translated from Greek to Latin numerous works of Aristotle, including: *Categories*, *On Interpretations*, *Posterior Analytics*, *Prior Analytics*, *On Sophistical Refutations*, *Physics*, *On Heavens*, *On the Soul*, *Metaphysics*, and *Nicomachean Ethics*. In addition, he translated Porphyry's *Isagoge*. The translations were dedicated to Cosimo and Piero Medici and were probably completed between 1464 and 1469. Argyropoulos' close ties with the Medici are proven by the fact that Lorenzo Medici was his student. Between 1467 and 1469, Argyropoulos suffered the loss of his two or three sons. Furthermore, Piero Medici died in 1469. These unfortunate events led him to leave Florence. It seems that he planned to move to Hungary, but suddenly changed his mind and preferred to stay in Rome. In 1471, Argyropoulos arrived in Rome. It is highly probable that the appointment of Pope Sixtus IV (1414–1484), who was Argyropoulos' former colleague, and Bessarion's (1408–1472) presence in the Curia induced him to choose Rome as his new residence. Both the Pope and Bessarion wished to reestablish Rome as the cultural center of Renaissance Italy. Argyropoulos stayed in touch with the leading Florentine families, especially the Medici, since, as a result of his hasty departure, he left behind his books and several unsolved disputes. Upon his arrival in

Rome, he associated with scholars and artists of the Curia. According to several sources, he taught, besides Aristotle, Thucydides' *History*. As a result of Bessarion's death and his personal turmoil, Argyropoulos decided to leave Rome and looked for a new destination somewhere in Western Europe. During the same period, Andronicus Callistus (1400–1486) – a renowned Greek scholar who taught in Florence and other Italian and European cities – abandoned the Florentine Studium and accepted a position in Milan. In addition to Argyropoulos, another important Greek scholar, Demetrius Chalcocondyles (1423–1511), applied for Callistus' position. In his return to Florence, Argyropoulos shaved his beard as a proof of his Latinization. That was not so common for someone in his age. Finally, in 1477, Argyropoulos was reappointed in his former position as professor in the Florentine Studium. The Florentines also hired Chalcocondyles, an indication of their interest in classical letters. Argyropoulos taught in Florence till 1481, contrary to Chalcocondyles who retained his position till 1491. In 1481, Argyropoulos was in Rome. There are contradicting testimonies concerning his later life. In several sources, he seemed to spend a lot of money and live a luxurious life, while others attested that he was poor and struggled to overcome his problems. According to Laskaris, he was obliged to sell his books in order to buy food. He died in Rome. According to not reliable sources, the cause of his death was the consumption of watermelon.

Innovative and Original Aspects

Argyropoulos was able to present to the Latin audience a comprehensive and unified version of Aristotelian philosophy. Moreover, he instructed to the Italians the Presocratics, the proper knowledge of whom was crucial for the understanding of Socrates, Plato, and Aristotle. In his lectures on Aristotle's *Physics*, he supported that the sciences were invented in Greece, after Deucalion's flood, despite the fact that there were sciences all over the world. According to Argyropoulos, the

Egyptians did not suffer from the flood and were capable of assisting the Greeks; the latter accepted their help pleasantly. But in that early period, science was in an infantile stage. Scientific truths were expressed in poetic form and were inaccurate. Philosophers knew a lot of things, but they were not able to communicate them with precision and accuracy. Pythagoras was the first who was able to widen philosophy. Furthermore, Plato achieved to set poetry aside, despite the beautiful language he used. In the Platonic dialogues, the reader could find a wide range of subjects. Argyropoulos disagreed with the Platonic insistence on the primacy of mathematical explanation of nature, a rather predictable reaction since he, as an Aristotelian, gave preponderance to physical explanation. Aristotle, the successor in that chain of knowledge, spoke about the principle of things as natural. In addition, he presented the world as unified. Argyropoulos admitted that even Aristotle retained some obscurity in his texts. It is obvious that Argyropoulos divided ancient philosophy into Presocratic, Platonic, and Aristotelian eras. It is of great importance that Argyropoulos did not follow common trends of Florentine Platonism, which included ancient mystical traditions, such as the *Chaldean Oracles*, the *Corpus Hermeticum*, etc., in the history of philosophy. According to Argyropoulos, Anaxagoras, despite his poetical tone, was probably the first true philosopher. Despite his positions, we have to bear in mind that Argyropoulos was an admirer of Plato's hidden doctrines and even his faithful students acknowledged that his style was extremely learned and difficult in understanding. Moreover, Argyropoulos argued against Averroes on the debated issue of the soul. He admitted that Christian truths could not be proven logically, but are of greater value in comparison to the philosophy of Averroes. This is a proof that Argyropoulos did not share the pagan tendencies of the rest of the Florentine philosophers of his times. Rather, he got embroiled in the debate between Greek and Latin scholars about Cicero. Namely, Renaissance scholars appreciated Cicero and thought of him as equal to the great thinkers of ancient Greece. Cicero held that the Greek language is poorer than the Latin. Argyropoulos felt the need to

reply to Cicero and accused him that he was ignorant of philosophy. In addition, Cicero did not know any Greek. Argyropoulos commented on Cicero's views about *entelechia* and proved that Cicero misinterpreted the term. Several Latin scholars felt offended by Argyropoulos' and other Greek scholars' attack on Cicero. Poliziano (1454–1494) defended Cicero and Giovio (1483–1552) found it to be a good reason to ridicule Argyropoulos. After his oration addressed to Emperor Constantine Paleologus, Argyropoulos' political views were further elaborated in the dedicatory prefaces of his translations, made after Cosimo Medici's bequest. Although the Florentines presented Cosimo as a man of action, Argyropoulos preferred to depict him as a virtuous Aristotelian ruler, who guided the Florentines toward *eudaimonia*. Cosimo's wealth was not a goal in itself; rather it was a means for the achievement of ideal goods, such as happiness. Argyropoulos compared Cosimo to the Platonic and Aristotelian ideal rulers. Despite the fact that Argyropoulos had ties with Bessarion, he engaged in a dispute with Theodorus Gaza (1398–1475) about Bessarion's *In Calumniatorem Platonis*. When the latter's work was published (1469), the author sent a copy to Argyropoulos, who replied with a long letter in Greek and a small one in Latin. In the former, Argyropoulos praised Bessarion and seemed to agree with his arguments against Trapezuntius. Despite the fact that he was an ardent Aristotelian, Argyropoulos did not underestimate Platonic philosophy and did not participate actively in the heated debate between Greek scholars concerning the preponderance of Plato or Aristotle. Despite his appreciation for Bessarion and his work, he pointed out an error to him and expressed his views which led Bessarion to correct his text. The disputed issue was a paraphrased Porphyry's passage concerning whether forms are separable or inseparable, which Bessarion and Porphyry refused to answer in depth. Argyropoulos disagreed with certain words in the translation of the *In Calumniatorem Platonis* from Greek to Latin. Furthermore, he found Bessarion's argument logically defective. Moreover, Argyropoulos argued that Bessarion should have wondered whether forms subsist or

reside only in simple concepts. Finally, he disagreed with the cardinal on the forms being separated and being subsistent. Argyropoulos found the chance to argue against Aristotle: he supported the scholastic view that imagination resided in the heart and not in the brain, as the Stagirite held. Bessarion did not reply directly to Argyropoulos' letter; instead, he ordered Theodorus Gaza to compose a short treatise entitled *Antirrhethicon* against Argyropoulos' claims. In it, Gaza attempted vainly to confront Argyropoulos' positions. Yet he did not succeed since Argyropoulos' remarks were valid.

Impact and Legacy

Argyropoulos lectures and translations impacted Renaissance scholars. His teaching renews the way the Latin West understood and appreciated Aristotle. His student and friend Donato Acciaiuoli published a humanistic commentary of the *Nicomachean Ethics* (1478) based on Argyropoulos' work on Aristotle. Several others used his translations in order to comment on Aristotle. Erasmus frequently praised him for the quality of his translations.

Arias Montano, Benito

Born: 1527, Fregenal de la Sierra, Extremadura, Spain

Died: 1598, Seville

Alejandro Coroleu

Faculty of Arts, Department of Catalan Language, Universitat Autònoma de Barcelona, Barcelona, Bellaterra (Cerdanyola), Spain

ICREA-Universitat Autònoma de Barcelona, Barcelona, Spain

Abstract

The Spanish scholar Benito Arias Montano, librarian of El Escorial, was an outstanding translator of, and commentator on, biblical

texts. He was one of the general editors of the Polyglot Bible published at Antwerp in 1573. He was also the author of a large body of Latin poems of religious subject matter.

Biography

The son of an inquisitorial secretary, Arias Montano studied grammar, rhetoric, philosophy, and Oriental languages at the University of Seville. After his father's death – and upon the advice of the canon of Badajoz Cristóbal de Valtodano – he transferred to the University of Alcalá, where he obtained a degree in Arts in 1549. Inaugurated in 1498 by Cardinal Archbishop Francisco Jiménez de Cisneros, the University of Alcalá applied the program of humanism to its curriculum and to the study of Scripture, even if conservative positions within it ultimately prevailed. As early as 1508 Jiménez himself initiated a great project of biblical scholarship which resulted in the printing between 1514 and 1517 (even though they were not actually published until 1522) of the six volumes of the renowned Complutensian Polyglot Bible (thus called from Complutum, the Latin name of Alcalá de Henares). The foundation of the University had, moreover, its roots in Jiménez's desire for religious reform. The institution became a center for ecclesiastical education and among its professors and students were the first enthusiastic supporters of Erasmus in Spain.

At Alcalá, after completing his studies in Arts, Arias Montano took courses in Theology and continued his biblical studies under the guidance of Fray Cipriano de la Huerta between 1549 and 1552. That same year he was appointed poet laureate and moved to Salamanca, where he studied Law until 1554. Having received his first orders in 1562, Arias Montano became a clerical member of the Military Order of St. James. He was persuaded by the Archbishop of Valencia, Martín Pérez de Ayala, to leave his retirement at the Peña de Aracena – where he had been remained after his sojourn at Salamanca – and join the sessions at the Council of Trento. On his return to Spain, Arias was appointed royal chaplain by

King Philip II. In 1568 his career took a turn, and he became closely involved in the production of Christophe Plantin's Polyglot Bible at Antwerp. Despite being sponsored by the Spanish King, who had authorized the project "given the enormous demand among scholarly and religious men for the Bible printed by Cardinal Jiménez de Cisneros," since its inception the enterprise was met with papal skepticism, and Plantin had difficulty in obtaining papal approval because of the implicit criticism of the Vulgate underlying the text. The Antwerp Polyglot was highly innovative because it was accompanied by a large critical apparatus in which the Bible was treated as a work of literature in its historical context rather as a source of dogma. This, together with the questionable orthodoxy of many of the editors and the use of the translation by the Italian Dominican and Hebraist Sanctes Pagnini, led the theologian León de Castro, professor of Oriental languages at Salamanca, to whose version of the Vulgate Arias Montano had opposed the original Hebrew text, to denounce Arias to the Roman Inquisition. Arias Montano traveled to Italy, and, after a series of inquiries and hearings at the Roman curia, he was freed of the charges, and the project obtained the ecclesiastical *imprimatur*. On his return to Spain in 1576, Arias Montano became, however, again the target of severe criticism, this time from the Jesuit Juan de Mariana. The case was difficult inasmuch as Arias Montano was a well-known enemy of the Society of Jesus. In spite of this, Arias Montano was declared innocent of suspicion, and the Antwerp Polyglot was finally not included in the Index of forbidden books.

Developed partly as archives of estate accounts and legal documents, and partly in pursuit of the humanist interests of their owners, in the Renaissance court, libraries became important centers of humanist patronage. One of the most ambitious court libraries of the period was the Escorial near Madrid, monastery and personal retreat for King Philip II. The library was established in the 1570s and 1580s, and Arias Montano was summoned by the King to superintend the royal collections and to purchase Greek and Hebrew manuscripts and editions for the library. Among his duties he was also entrusted with teaching of Oriental languages

to the young monks at the monastery. Arias Montano spent the last years of his life dividing his time between prayer and study, only to interrupt his seclusion briefly in 1582 when he attended the Council of Toledo as special envoy of King Philip II.

“One cannot deny that he possessed great learning,” wrote Vigouroux in his *Dictionnaire de la Bible*, “and it is certain that he greatly contributed to the progress of Oriental studies.” Apart from his versions of the Old and New Testament, Arias Montano also had a scholarly interest in Judaism. We know that he owned, for example, a manuscript copy of part of Flavius Josephus’s *Antiquitates* and the entire *Bellum Judaicum* of the same Greek (the text is now Ms. G II 7 at the Biblioteca de El Escorial). Moreover, he penned treatises on theological and juridical matters. Yet, alongside his activity as translator of, and commentator on, biblical texts, he must be remembered as an outstanding poet in Latin. A glimpse of the numerous editions and reprints of Arias Montano’s poems (listed in Alcina 1995, pp. 40–45) reveals, if only by comparison with his colleague at the University of Salamanca and vernacular counterpart Fray Luis de León (1527–1591), the wide dissemination of his Latin poetry throughout the sixteenth century. In his Latin version of the Psalms published in 1574 – “the most demanding and obscure sacred text ever rendered from Hebrew into Greek and Latin,” as he wrote in a letter to Plantin – Arias Montano recast the Psalm texts in Horatian meters, following the example of Marco Antonio Flaminio (whose translation of the Psalms had been issued at Florence in 1546). He even went one step further and opted for Horatian meters for his own Neo-Latin poetry (best represented by the *Humanae salutis monumenta*, 1571, and the *Hymna et saecula*, 1593).

Aristotle: The Giuntine Edition

Charles Burnett

The Warburg Institute, School of Advanced Study, University of London, London, UK

Abstract

The Aristotle-Averroes edition printed by the Giunta brothers in Venice in 1550–1552 is the most complete edition of the Latin translations of the works of Aristotle and Averroes (together with many other related texts) produced up to that time. It represents the high point of interest in Averroes in northern Italy, especially at the University of Padua.

Description

In 1550, Tommaso and Giovan Maria Giunta published a ten-volume Latin edition of the works of Aristotle with all the commentaries of Averroes; it was issued in Venice, where the intellectual products of the University of Padua were usually printed. Two years later, in 1552, a prefatory fascicle and the first volume were added to this publication, which now bore the title: *All the works of Aristotle the Stagirite that exist, in choice translations which have been compared with the most accurate Greek exemplars, illustrated with marginal notes and arranged in a new order, with the addition of some books that have never been translated into Latin before. All the commentaries of Averroes the Cordovan on these works that have come down to us, and other books of his on logic, philosophy, and medicine, of which some, too, having escaped the notice of the Latins, have recently been translated by Jacob Mantino, others have been translated by the same scholar in a clearer and more faithful way than ever before, and the rest have been most diligently corrected in almost innumerable places from the manuscripts and the best printed books of the most celebrated philosophers of our time; each adorned with a large number of marginal notes.* The prefatory fascicle includes essays by Tommaso Giunta, who emphasizes the

importance of Averroes, and by Marco degli Oddi, who recounts the genesis of the book, as well as a general introduction to the transmission of Peripatetic philosophy and individual introductions to each volume. The fascicle ends with an index covering all 11 volumes, which indicates by asterisks those books which had never been published before. The project had been initiated by Giovanni Battista Bagolini but, after his death, was continued by Marco degli Oddi and Romolo Fabi.

Innovative and Original Aspects

The volumes supplement the medieval Latin translations of Averroes made by Michael Scot, Hermann the German, Theodore of Antioch, and William of Luna with more recent ones now made from the Hebrew versions of Averroes; the translators were Abram de Balmes, Giovanni Francesco Burana, Vitalis Nisso, Elias Delmedigo, Paolo Ricci (Israelita), and especially Jacob Mantino, who was charged by the editors with correcting the older translations and making new ones; the “antiqua translatio” was often printed alongside the “Mantini translatio.” But the volumes also included works of Averroes that were not commentaries, but rather independent philosophical texts – the *Destructio destructionum*, *De substantia orbis*, the *De animae beatitudine*, and the *Epistola de connexione* – and medical texts: the *Colliget*, the commentary on the *Cantica* of Avicenna, and a work on theriac. Short texts by other Arabic philosophers, translations of Hebrew “super-commentaries” by Levi ben Gerson, copious marginal annotations, the *Contradictionum solutiones*, and a compendious alphabetical index of terms in Aristotle and Averroes compiled by Marcantonio Zimara complete the volumes.

Impact and Legacy

Many Paduan scholars were involved in the enterprise, including: Marco degli Oddi, a teacher of logic in Padua; Giovanni Battista Bagolino, whose father, Girolamo, had been a professor of philosophy and medicine at the university; Abram de

Balmes; Jacob Mantino; and Marcantonio Zimara. A second Giunta edition, printed in 1562, was even more strongly Paduan, because of the additions of commentaries and *quaestiones* on Aristotle's *Posterior Analytics* by Bernardino Tomitano, a professor of logic at the university. An edition brought out by a different printer in Venice, Comin da Trino, in 1560, added a "mixed" version of Averroes's middle commentary on the *Metaphysics* made by Elias Delmedigo, as well as Averroes' medical treatise *On the Sperm* and his *Epitome of Plato's Republic* (translated by Mantino).

The 1562 Giunta edition was reissued unaltered in 1574–1575, but this edition marked the end of an era. After a final printing of Averroes' *Epitome of Plato's Republic* in 1578, no more texts of Averroes were printed until the nineteenth century, and Aristotle was increasingly being read in Greek with vernacular translations.

The 1550–1552 edition of Aristotle-Averroes is remarkable for the care with which it was prepared, for the detail in which the editorial method is explained, and for the quality of the printed text. It marked the culmination of an interest in Averroes as a commentator on Aristotle and as a thinker in his own right, which had begun with the printings of Aristotle with Averroes by Lorenzo Canozio in Padua in 1472–1475. As Charles Schmitt has put it (Schmitt 1979, 131), the Giuntine edition was a "philosophical reaction to philological humanism." Through its carefully edited texts and apparatus of notes and commentaries, indexes, and cross-references, it provided a scholarly reference book which reflects the intense debates of the time and is still of use today.

antea ab aliis translata; caetera ex manuscriptis, optimisque codicibus Philosophorum hac nostra aetate celeberrimorum, innumeris pene locis diligentissime castigati; singuli compluribus margineis scholiis exornati. Arithmetic in the Renaissance

Albrecht Heeffer

Department of Philosophy and Moral Sciences (LW01), Ghent University, Ghent, Belgium

Abstract

In Renaissance arithmetic, we have to make a distinction between scholarly and lay cultures of mathematics. Arithmetic in the scholarly

culture was dominated by Boethian proportion theory as taught within the quadrivium. With the Latin translations of al-Khwārizmī's book on Hindu-Arabic numerals, the new system of arithmetic spread through algorisms, i.e., Latin works teaching basic arithmetic on natural numbers and fractions. The lay culture of practical arithmetic adopted the methods from the Maghreb region of calculations on the ghubar or dust board. This abacus culture became important for the growing class of merchants operating within the new mercantile economy of the fourteenth and fifteenth century. Abacus treatises adopted schemes for justification of the validity of operations both in arithmetic and algebra. An early form of symbolism developed from these justification schemes. The insistence on exact solutions fitted very well the mercantile principle of the just values, not only in the mathematical sense but also in the moral sense. The practice of Renaissance arithmetic led to the expansion of the number concept, by accepting irrational solutions, negative solutions, and roots of negative numbers. With the age of printing, abacus methods of calculation spread all over Europe. At the beginning of the sixteenth century, Germany, France, the Iberian Peninsula, England, and the Low Countries had vernacular works on arithmetic and established reckoning schools in commercial centers. The scholarly culture adopted the methods of lay culture by Latin works on practical arithmetic, such as by Frisius and Clavius.

Heritage and Rupture with the Tradition

It is important to make a distinction between a scholarly and lay culture of Renaissance mathematics. A scholarly culture of arithmetic and geometry was taught at universities within the *quadrivium*. The basic text on arithmetic was Boethius's *De Institutione Arithmetica*. The Boethian arithmetic strongly relied on Nicomachus of Gerasa's *Arithmetica* from the second century. This basically qualitative arithmetic deals with properties of numbers and ratios.

All ratios have a name, and operations or propositions on ratios are expressed in a purely rhetorical form. A *superparticular* has the form $(n + 1)/n$ and thus covers proportions such as the common *sesquialter* ($3/2$) and *sesquiter* ($4/3$) proportions; a *superpartient* proportion has the form $(m + n)/n$ with $m > 1$ and includes proportions such as $8/3$. Such a qualitative arithmetic had little practical use. The theory of proportions was hardly studied outside monasteries and universities and was mainly intended for aesthetic and intellectual pursuit. During the eleventh century, a board game named *Rhythmomachia* was designed to meet with these aesthetic aspirations. The game was most popular during the fifteenth and sixteenth century. It disappeared during the seventeenth century together with the study of *De Institutione Arithmetica*. Despite its limited applicability, Boethian arithmetic evolved into a specific kind of mathematics, typical for the late Middle Ages, and left its mark on early-modern natural philosophy. Carl Boyer's book on the history of calculus (Boyer 1959) demonstrates how fourteenth-century thinkers such as Thomas Bradwardine and Richard Suiseth developed ideas on continuity and acceleration within this framework, thus also influencing Renaissance developments of mathematics and natural philosophy.

Arithmetical problem solving became much more advanced with the introduction of Arab algebra through the Latin translations of al-Khwārizmī's *Algebra* by Robert of Chester (c. 1145), Gerard of Cremona (c. 1150), and Guglielmo de Lunis (c. 1250). With the possible exception of Jean de Murs' *Quadripartitum numerorum* at the Sorbonne (L'Huillier 1990), algebra was not practiced or taught at universities for the following three centuries. Algebra continuously developed within the vernacular tradition of abacus schools in fourteenth- and fifteenth-century Italy. Algebra thus was not only foreign by its Arabic origins; it remained mostly foreign to the scholarly tradition until the sixteenth century.

Apart from the scholarly culture, arithmetic was taught and practiced in the lay culture of merchants, surveyors, and artisans. Before the twelfth century, practical arithmetic was based

on Roman numerals and calculating procedures. In the same way that Boethian proportion theory can be understood as a qualitative arithmetic – using names rather than figures for proportions – so did Roman fractions all have specific names which were derived from the system of monetary units and units of weight. One *as* was divided into 12 *unciae*, one *uncia* into 24 *scripuli*, one *scripulus* into 6 *siliquae*, and one *siliqua* into 3 *oboli*, alternatively one *scripulus* could also be divided into 8 *calci*. Fractions of 12 parts had names such as a *dodrans* for 9/12 and thus equivalent to $\frac{3}{4}$. Also, separate symbols were used for the most common fractions. Evidently, the number of fractions possible in such a system is finite, but combinations of fractions could cover all practical needs. Operations on fractions were performed on the Roman abacus, a bronze device resembling the Chinese abacus. This practice was reformed during the tenth and eleventh century by Gerbert and Bernelinus introducing a new abacus in which operations were carried out on a table marked with columns using tokens or *jetons* (Friedlein 1867).

The Roman number system was gradually replaced by the introduction of the decimal place value system transmitted from the Arabic tradition. This revolution in practical arithmetic took several centuries within the scholarly culture through Latin texts explaining Hindu-Arabic numerals and their operations, commonly referred to as *algorisms* or by “Dixit algorismi” (DA). The term “algorism” refers to al-Khwārizmī, who wrote the first Arabic work on Hindu numerals. Later manuscript copies are further divided into three families: the *Liber Ysagogarum Alchorismi* (LY), *Liber Achorismi* (LA), and *Liber pulveris* (LP). Within the lay culture, the use of Hindu-Arabic numerals spread from the Maghreb region to the Iberian Peninsula and over the Provence region to Northern Italy, through the abacus tradition. Fibonacci’s *Liber Abbaci*, though written in Latin, fits better within the practice of lay culture than in the scholarly culture. Fibonacci’s use of the fraction bar was part of the Maghreb practices with the dust board or *ghubar* and did not appear in the early Latin algorisms.

With the commercial revolution of the thirteenth century, the main participants in commercial activities transformed from traveling to sedentary merchants (Van Egmond 1976). Instead of undertaking single commercial transactions combined with travel, merchants set up companies or *vetturali* in cities of Northern Italy, operating in multiple simultaneous buying and selling operations. The first banks, insurance companies, and shipping agencies were established for financing, insuring, and logistically supporting these early companies. For keeping track of multiple simultaneous transactions, the system of double-entry bookkeeping became in use from the beginning of the fourteenth century. A whole new social class was established consisting of merchants, bankers, bookkeepers, surveyors, and gaugers, all supporting the new mercantile economy. The mathematical enculturation of commercial personnel became a major concern. Abacus schools were founded from the end of the thirteenth century. Around 1343 there were no less than 1,200 students attending abacus schools in Florence. Boys between 10 and 14 were sent to these schools after they mastered writing at a grammar school. They were taught the essentials of calculating with Hindu-Arabic numerals, rules of merchant arithmetic and the basics of units of measurement, and the value of coins (Ulivi 2004). The abacus masters earned their living from teaching in a *bottega*. Some were employed by their city; others operated on a private basis and lived from student fees and possibly renting rooms to students. Earning a reasonable living, they belonged to the middle class. The profession often depended on family relations. The Calendri family is known to consist of five generations of abacus masters.

By the end of the fifteenth century, the teaching material and methods of abacus schools came to print with the first arithmetic books and circulated through Europe. The very first was *Arte dell’Abbaco*, better known as the *Treviso arithmetic*, as it was printed in Treviso in 1478. A manuscript by abacus master Filippo Calandri (Ricc. 2669) was printed in Florence in 1491–1492. But especially Luca Pacioli’s *Summa* (Pacioli 1494) was instrumental in the

wider dissemination of commercial arithmetic, practical geometry, and algebra from the abacus tradition. On the Iberian Peninsula, the first commercial arithmetic was by Francesc Santcliment, printed in 1482, both in Lyon and Barcelona from a Catalan manuscript (Malet 1998). In France, the first important merchant arithmetic was published by De la Roche (1520) appropriated from a manuscript by Chuquet (1484). In Germany, the first commercial arithmetic was authored by Johannes Widmann (1489). The most popular German arithmetic books were published by Adam Ries, first the *Rechnung auff der linihen* in 1518, but his expanded edition (Ries 1527) reached over hundred prints during the next century. In the Low Countries, the first arithmetic book was *Die Maniere om te leeren cijffren*, printed in 1508 in Brussels, translated in French and published in Antwerp in 1529. In 1539 it was translated into English as *An introduction for to lerne to reckon* and printed in London. Robert Recorde was the first Englishman to publish a book on practical arithmetic in 1543, *The Ground of Arts*. Reckoning schools flourished in the commercial centers of Germany and the Low Countries. In Antwerp the social status of arithmetic teachers grew considerably during the sixteenth century until the Sack of Antwerp in 1567 when many migrated to the North (Meskens 2013).

Innovative and Original Aspects

While the Boethian tradition depended on scholastic authoritative texts such as the *Arithmetica* by Nicomachus, the abacus tradition could not rely on any accepted authority. Even stronger, the Eastern origin of calculating with Hindu-Arabic numerals was met with skepticism and resistance from authorities. The dictate by the University of Padua of 1348 stated that prices of books should be marked not in Hindu-Arabic but in Roman numerals “non per cifras sed per literas claras” (Ball 1961). Precisely because the abacus tradition was missing the argumentative style from the scholastic tradition, it had to devise its own tools for justifying the validity of basic operations and practices. The early abacus treatises often used

marginal schemes for this purpose. The schemes were devised for the justification of the operations being a model of the concrete actions that were taught to students in abacus schools. The justification schemes also depended on the tangible aspect of carrying out the operations on a drawing board. Furthermore, the schemes depended on the early symbolism disseminated from Maghreb practices with the *ghubar*, such as the fraction bar (Høyrup 2010). Schemes were used for the operations on fractions, for validating the rules of signs, for the multiplication of irrational binomials, for special rules such as double false position, and for algebraic operations. Some schemes, as for the multiplication of binomials, facilitated the abstraction of the objects on which one operated. In some way, the early algebraic symbolism that developed during the fifteenth century can, like the schemes, be considered as nondiscursive elements in the text, providing a justification for rhetorically described algebraic procedures (Heeffer 2014).

Another distinct feature of fifteenth-century arithmetic and algebra is the consistent use of exact values and solutions. One cannot find any approximations in arithmetical or algebraic solutions. Approximations only appear in the context of practical geometry and surveying. Maestro Antonio de' Mazzinghi, in his *Trattato di fioretti*, solves a simple problem of two men bartering wool against cloth (Arrighi 1967, 31–2). He arrives at the price for the cloth at $\sqrt{43(6689/10000)} + (33/100)$ fiorini.

Through the persistent use of exact values for merchant-type problems, abacus masters established the objective true value of goods within a transaction, even if this had to be expressed in surds. The underlying idea was that there always exists a just and true value in exchange. Earlier in medieval society, the

marketplace was already recognized as a guide to the determination of value. But this value was a fuzzy concept, a value subject to many approximations in calculating the exchange rates of currencies and unit conversions which could be different from city to city.

Renaissance arithmetic and algebra together with double-entry bookkeeping gave support to the idea of a value which can be determined in principle as the just value, not only in the mathematical sense but also in the moral sense. In profit calculation of barter exchanges or in interest calculations, frequent references appear to the *fair* value or use the condition “so that no one is being cheated,” indicating the moral obligation to account for exact values (Heeffer 2011). The importance of dealing with exact values became the basic concept of mercantilism. According to Foucault (1966, 188), the essential aspect for the process of exchange in the Renaissance is the representation of value. “In order that one thing can represent another in exchange, they must both exist as bearers of value; and yet value exists only within the representation (actual or possible), that is, within the exchange or the exchangeability.” The act of exchanging, i.e., the basic operation of merchant activity, both determines and represents the value of goods. To be able to exchange goods, merchants have to create a symbolic representation of the value of their goods. Merchant arithmetic and its system of mathematical enculturation were of essential importance to mercantilism.

One more important contribution of Renaissance algebra is the expansion of the number concept. Irrational solutions were already common in abacus arithmetic. However, while negative numbers occasionally do appear, they were not accepted as isolated negative quantities. At best, an interpretation could be given as a debt. By considering negative solutions to algebraic problems as a debt, abacus masters denied the possibility of a negative quantity rather than accepting it. This attitude changed during the sixteenth century. Cardano was the first to accept negative solutions within the context of algebra. By posing a negative unknown, and so twisting

the rigid rhetorical style of abacus algebra, he also was the first to accept roots of negative numbers as valid solutions to equations (Heeffer 2010). But it was Simon Stevin who most explicitly challenged the Ancient Greek number concept. He devotes the first 20 pages of his *L'arithmetique* (Stevin 1585) to definitions of number which include irrational numbers. He also insists on considering one or the unit as a number, which is not the case for Euclid or Diophantus.

Impact and Legacy

The scholarly culture of Renaissance mathematics somewhat struggled with the reception of merchant arithmetic books. The sixteenth century inherited the humanist program, initiated by Regiomontanus and further executed by Petrus Ramus, Jacques Peletier, François Viète, and Christopher Clavius, to restore, publish, and reform the mathematics of classic works. This worked well for the geometry of Euclid, Pappus, and Apollonius, but the foreign origin of practical arithmetic and Arabic algebra posed a problem for some humanists. François Viète devised a whole new vocabulary to avoid the use of “barbarian” words such as “algebra.” The myth was spread that Arabic algebra descended from Diophantus’ *Arithmetica*. Inevitably however, many Latin textbooks on arithmetic of the sixteenth century treated merchant arithmetic and carried the term “practical” in their title. The two most prominent were Frisius (1540) and Clavius (1585). As Latin algorisms proved to be inadequate for didactic purposes at Latin schools, these two Latin books enjoyed much popularity and a long life span. They treated the subjects of the old abacus schools, such as numeration, operations of arithmetic, the rule of three, rules of merchant arithmetic, false and double false position, root extraction, and occasionally some basic algebra. Frisius (1540) was reprinted in more than a hundred editions during the sixteenth century.

Arminius, Jacobus

Born: 1559 at Oudewater

Died: 19 October 1609 at Leiden

Henri Krop
Faculteit der Wijsbegeerte, Erasmus Universiteit
Rotterdam, Rotterdam, The Netherlands

Abstract

Arminius was a Reformed minister and professor of theology at Leiden. Unlike his predecessors at this new University, he compiled a system of

theology. Adopting (neo)scholastic terminology, he attempted to solve the “political-theological” problem of predestination.

Biography

Arminius, an armorer’s son, was born around 1559, in Oudewater. 1560, the year mentioned in Bertius’s funeral oration is incorrect. His father died while he was an infant. In 1575, after the siege of the small town, Spanish soldiers murdered his mother. A local priest, Theodore Aemilius, who detested “the abominable sacrifice of the mass,” taught him Latin and Greek and paid for his further schooling at Utrecht. After Aemilius’s death, he went with Rudolphus Snellius (1546–1613), presumably another relative, to Marburg. Snellius, who at that time taught biblical languages at that university, was an admirer of Petrus Ramus and Arminius adopted his Ramism. In 1576, he enrolled at the newly founded Reformed University of Leiden. In 1581, Arminius, funded by an Amsterdam Guild, went to Geneva in order to study theology under Theodore Beza and Charles Perrot (1541–1608), who did not adopt Beza’s view of predestination. It is therefore unlikely that Arminius ever shared “supralapsarianism.” In Geneva, his Ramism incurred the wrath of the authorities, and Arminius went to Basle where he defended six disputations. However, in 1584, Arminius returned to Geneva. In 1586, he visited Italy, provided “with a Greek New Testament and a Hebrew Psalter.” He attended the teaching of Jacopo Zabarella. In Rome, Arminius learned the “iniquity of the Roman court of the Antichrist.” His enemies, however, accused him of “kissing the Pope’s slipper” and befriending the Jesuit Robert Bellamine. In 1587, Arminius returned to Amsterdam and was ordained a minister. In 1590, he married Lijsbert Reael. It linked him with the regent class. In 1591, the regular sermons Arminius delivered on Romans 7 started the controversy

on predestination in the Amsterdam church. In the dissertation based on these sermons, published after his death, he argued that according to the Apostle, “regenerate man” is freed from “the law of sin” and by his Faith will be saved. Moreover, this position has always had defenders in the church and it does not imply “Pelagianism” – the heresy that man will be saved by his own works. He was acquitted of “teaching Pelagianism,” and the rest of his ministry passed peacefully.

In 1603, Arminius, provided with favorable testimonies of the Amsterdam church – removed from the consistorial acts after 1617 – was appointed professor of theology at Leiden. The opposition, lead by Franciscus Gomarus (1563–1641), was silenced for the time being. In October 1604, his senior colleague resumed hostilities, by almost openly attacking him in an ad hoc disputation on predestination. Arminius answered with a detailed refutation. However, in August 1605, the faculty put the churches at ease by declaring that its professors were in agreement concerning “the fundamentals of doctrine,” and in the same year, Arminius was elected *Rector Magnificus*. In the address he delivered after his term, he outlined the means to end religious dissent among Christians. As ultimate remedy, he proposed a national synod, to be organized by the magistrate. This was the practice among the Jews and the early church, and the magistrate as layman is a better judge of the fundamentals of religion.

By 1608, the magistrates of Holland could no longer ignore the enduring conflict on predestination in its university, since it implicated the Belgic Confession and the Heidelberg Catechism, the confessional documents of the Public Church, which all its ministers had to subscribe. The truce negotiations between the Republic and Spain (1607–1609) divided the provinces anew, and the political parties exploited existing theological and ecclesiastical antagonism in order to gain support. The States of Holland in order to regain control of the situation invited the opponents to present their views. In October 1608, Arminius outlined his sentiments on predestination. This basic text was posthumously published. At the end, he daringly called for a revision of the Belgic Confession and the Heidelberg Catechism. Gomarus responded

by accusing him of Pelagianism and Popery that is in secretly endorsing the cause of Roman Catholicism. Controversy remained during Arminius's last year, in which his already weak health further deteriorated. It intensified until the Synod of Dordt (1618–1619), which settled the issue of the confession for years to come (Bangs 1971).

Theological System

In 1603, Arminius began his lectures with an outline of the prolegomena of theology. He dealt with its object, author, and certainty. Using scholastic concepts, he argues for the excellence of theology and the subordination of the other sciences, since God is the cause of causes. Like Duns Scotus and Ramus, Arminius maintains the practical nature of the divine science, since human blessedness is its goal. This implies that he taught theology in an “analytical order,” because it describes the means to a given end. Its practical nature makes religion its object. It consists of all our duties toward God. God prescribes these obligations both in the word inscribed in our minds and in scripture. Arminius continues with conventional Reformed themes, such as authority, certainty, perfection, and perspicuity of the Bible. Since blessedness is only possible by knowing God, Arminius continues by dealing with God's existence and nature and His attributes. Although the existence of God is self-evident, Arminius produces eight arguments of a – vaguely – Thomist inspiration. Following the order of his system, he subsequently discussed creation, divine providence, the first covenant with man, original sin, and the order of salvation, which requires dealing with Christ and His offices, predestination, faith, the church, and the sacraments (Stanglin 2007).

Predestination

In the *Declaration of Sentiments* (1610), it is observed that the first article of religion is predestination. Arminius apparently realized the philosophical implications of the doctrine, but he merely discussed the notion by means of biblical authorities. He dealt with four rival positions

upheld in the Reformed churches. However, the most prominent alternative to his own position is supralapsarianism, which Calvin and Beza seemed to teach “in order to avoid the grave error of Pelagianism.” Their doctrine implies that God “eternally decreed to save some men and damn others before he considers them as created, much less as fallen.” The divine decree predestining some men to salvation and others to damnation logically precedes the decree of God determining the Fall, and hence the position attributed to Beza is called “supralapsarianism” (before the Fall). According to Arminius, this doctrine implied the serious heresy of Manicheism, since it made God the direct cause of damnation and the author of evil and sin. This doctrine was “new,” being neither heard in the ancient church, nor mentioned in the first Reformed confessions. Adopting the Aristotelian notion of the Golden Mean, he observed that the “catholic” truth is to be found between the falsehood of both extremes: Pelagianism, which denied the indispensable need of divine grace, and supralapsarianism, which denied free will restored by grace.

According to Arminius, the divine attributes such as perfect goodness and omnipotence imply divine providence. However, there is the reality of evil, which sin causes. If God is not its author, free will is the proximate cause of sin. In order to reconcile providence and free will, Arminius developed his own version of the sequence of decrees that is determinations of the divine will. Contrary to the supralapsarianism of Beza and Gomarus, which made predestination the first in the logical order of the determinations of God, Arminius makes predestination the last one, preceded by the decrees to appoint Christ as savior and to bestow grace on all men provided with repentance and faith. Particular to Arminius's position is also the part the divine foreknowledge has to play here (Stanglin and McCall 2012). Elsewhere he explains this foreknowledge by means of the scholastic notion of “middle knowledge,” developed in order to reconcile divine prescience, which being science in the Aristotelian sense refers to necessary objects, with the contingency of future things, such as our free volitions. Arminius argued that God knows Himself and the essence of all things with strict necessity. The

contingent existence of creatures, however, He knows with hypothetical necessity only, since they are produced into existence by a free act of the divine will. “The schoolmen” called God’s foreknowledge, he continues, “middle knowledge,” because it precedes the act of the will, which grounds His free knowledge. If, for example, A will sin, he necessarily will be damned, but that A will sin is contingent, determined by free will: God’s free will by permitting A to will to act sinfully and A by actually willing to do so (Muller 1991). It is highly probable that he took over this concept from the Jesuit Luis de Molina. This is why contemporaries saw a clear similarity between the Jesuit and Arminian position, while the contraremonstrants felt that the Dominicans anticipated their position.

Impact and Legacy

Arminius’s reputation mainly rests on the 1610 “remonstrantie” (remonstrance). This “discourse,” mainly compiled by Arminius’ lifelong friend Johannes Wtenbogaert (1557–1644) and presented to the States of Holland, created Arminianism. Signed by 46 ministers, it summarized Arminius’ views of providence, predestination, and free will, in five main tenets. These five articles were rejected by the international Reformed Synod of Dordt in 1618–1619. The judgments of the Synod opposed the “remonstrance” with the so-called Five Heads of Doctrine. In the Anglo-Saxon world, this response has become known as the “Five Points of Calvinism.” So, indirectly, Arminius created the identity of Calvinism.

the growing demand for public correspondence among various political and religious institutions in the Late Middle Ages. Public officials found in this art a useful method and numerous examples, helpful in different situations, in order to draft a great deal of letters fitting for the most various authorities, with the due respect for social hierarchy.

Heritage and Rupture with the Tradition

Although the term *dictamen* refers to composition in general – whether prose, metrical, or prosimetrical – *ars dictaminis* (“art of prose composition”) and *ars dictandi* (“art of composing in prose”) designate a medieval system of rules defining the art of editing prose documents as well as a treatise explaining those rules. Furthermore, the Latin verb *dictare* is used by medieval scholars to specifically refer to the teaching of epistolography, namely, the art of writing letters following the prescriptions of rhetoric (Camargo, 36).

For centuries the art of writing letters has kept its practical purpose by adopting a literary prose and by tracing valid examples, such as model letters (*dictamina*), suitable for different circumstances concerning oral presentation of texts. Only in the Early Middle Ages arouse among scholars a specific need to create a system of rule in order to organize and catalogue practices and customs that had been in use since ancient times (Grendler, 775). In fact numerous textbooks of *ars dictaminis*, which spread through Europe starting from the last decades of the eleventh century, served chiefly to develop useful techniques for composing letters or legal documents; their aim was to train those clerks or laymen who intended to become professional writers dealing with official communication (Camargo, 36).

Ars Dictaminis

Dario Gurashi
Classe di Scienze Umane, Scuola Normale
Superiore, Pisa, Italy

Abstract

The *ars dictaminis* describes the medieval tendency to organize intellectual activities following precise rules when dealing with oral presentation of written messages. It consists of a system of guidelines, examples, and prescriptions for composing letters on the basis of rhetorical directions drawn from ancient oratory. The successful diffusion of the system throughout the European universities lies in

Innovative and Original Aspects

Looking at history, the *ars dictaminis* was technically developed between twelfth and the fourteenth centuries in Italy (primarily in Bologna) (Murphy, 211–212), where the medieval communes recruited salaried rhetoricians or public

officials with literary skills – overcoming the grammar studies given in the scholastic education system – who were highly trained in speaking and writing well, in order to fulfill administrative and cultural tasks related to public affairs. The organization of the political power in courts, chanceries, or bishoprics demanded qualified secretaries or notaries handling procedures of drafting letters and dispatches oriented toward oral presentation of the message (Grendler, 114–115). Hence public needs for live communication drove the development of the *ars dictaminis*, which early began to be taught in the universities and proved to be an efficient method built on a solid oratorical basis, particularly on the guidelines provided by classical authors (Witt 1982, 6–7).

In fact the teachers of the art (*dictatores*) drew amply from ancient handbooks of oratory as guidance for letter composition: in particular they used Cicero's *De inventione* and the pseudo Ciceronian *Rhetorica ad Herennium* as basic sources to which they flanked various precepts gathered from Quintilian's *Institutio oratoria* (Witt 1982, 7–8). Following the instructions about the classical arrangement of an oration – made up by *inventio* (seeking for arguments), *dispositio* (arrangement), *elocutio* (style), *memoria* (recollection), and *actio* (enacting) – they introduced and modeled a typical division for a letter in five parts: *salutatio* (a calibrated greeting according to the social status of the recipient), *captatio benevolentiae* (capturing the goodwill), *narratio* (brief statement of facts), *petitio* (request of action), and *conclusio* (summingup and conclusion) (Grendler, 115; Camargo, 36). Each section of a letter was further enhanced with specific examples, sentences, or entire drafts of epistles employed as models to follow. Classifying a variety of epistolary styles, medieval teachers listed numerous stylistical remarks that ensure rhythm and elegance to the prose: for instance, they suggested elegant expressions marked by brevity or diplomacy, in place of liveliness or spontaneity (Witt 1982, 14), and recommended great accuracy in *cursus* (a set of patterns for a rhythmic sequence of syllables), *distinctiones* (the clauses of a sentence, such as *comma*, *colon*, or *periodus*), and punctuation (Camargo, 36).

Impact and Legacy

The origins of the method date back to the late eleventh century, when Alberic of Montecassino wrote his *Breviarium de dictamine* and *Flores rhetorici dictaminis* (Murphy, 207–211), expounding the rudiments of the art that were later developed by Adalbert of Samaria in his *Praecepta dictaminum* (around 1118) and by Hugo of Bologna in his *Rationes dictandi prosaice* (between 1119 and 1124) (Witt 1982, 9–10). Since the midtwelfth century, textbooks of *ars dictandi* rapidly spread in France, among the Orléans masters, and later in Germany and England (Camargo, 36). Thanks to scholars like Boncompagno from Signa, Bene from Florence, and Guido Faba, the Bolognese *dictamen* remained dominant until the rising humanists deeply reshaped the medieval rhetoric system Witt 1982, 34–35).

Art of War in the Renaissance

Ferenc Hörcher

Institute of Philosophy, Hungarian Academy of Sciences, Budapest, Hungary

Department of Aesthetics, Pázmány Péter Catholic University, Budapest, Hungary

Abstract

To understand Renaissance military theory, one needs to start out from its ancient and medieval heritage. The Roman and Byzantine literature on the topic was quite narrow but still for a long time determined European military thought. Compared to these tracts on strategy and tactics, Florentine humanists introduced new themes and new arguments, a whole new approach to battlefield success and military participation.

While Bruni was perhaps the first explicit representative of this new, Florentine understanding of waging wars, this entry focuses of Niccolò Machiavelli's ideas on the art of war. The part addressing this issue in his *The Prince* established a direct connection between the art of war and that of governing the state. This was dictated by his experiences of the returning armed conflicts among the city-states and some of the major European powers in Italy.

But even more significantly, his work *The Art of War* is perhaps the best known example of a Renaissance dialogue which argued for the citizens' militia instead of the use of mercenary troops. Contrary to our intuition, he is as close here to a realist political position as in *The Prince*. The dialogue argues that a dedicated military personnel makes colonization a more promising enterprise, while at home it may help the Prince (or the *popolo* itself, directly) to rearrange the political regime.

In other words, Machiavelli found a number of strong arguments why a popular army is a much more rational choice to rely on, than a mercenary troop would have been, in his patria. His arguments sound surprisingly modern, even if history did not fully confirm his

ideas on the short term, leading to the loss of popular government in Florence.

Synonyms

Revolution in military art; Warfare, early modern

Heritage

Renaissance theorizing about warfare grew out of medieval praxis, itself theoretically based on Publius Flavius Vegetius Renatus's classic piece *De re militari* (*Concerning Military Matters*), probably published in the fourth century CE, itself based on such works as that of Cato the Younger or Sextus Julius Frontinus. The Byzantine Empire also produced a number of military tracts, including the *Strategicon*, usually attributed to Emperor Maurice, which had an impact in Italy after their translations in the fifteenth and sixteenth centuries.

Rupture with the Tradition

During the Renaissance new developments like the emergence of large standing armies (e.g., those of the Republic of Venice and the French and Spanish kings), technological innovations such as increasingly effective uses of gunpowder, the development of military architecture, and new military strategies fuelled a rebirth of military theory.

The best known examples of this literature are found in the works of the Florentine humanist-statesman, Niccolò Machiavelli. He refers to what he calls the "art of war" in Chapters 12–14 of *The Prince* (written originally in 1513 or 1514 but published only posthumously in 1532) and in his separate work, dedicated fully to the topic of *The Art of War*, published in 1521. In what follows we shall concentrate on his views, omitting works by other authors, such as *On Knighthood* (1420) of Machiavelli's predecessor Leonardo Bruni and various works of his contemporaries, like those of Francesco Guicciardini (Bayley 1961).

Machiavelli's main counsel to the prince is that the latter should become "a professional in this art (*professore di questa arte*)" (Machiavelli 1998, XIV, 58). In other words, as Winter points out, Machiavelli establishes a close connection between the art of war and the *arte dello stato* (the art of governing the state) (Winter 2014, 167). This theoretical linkage reflects the practical reality of princely government in the Italian city-states of Machiavelli's day and most importantly the military role of the sixteenth-century Medici rulers of Florence.

Machiavelli's work turned out to be an influential contribution to the literature produced by the European military revolution of the sixteenth and seventeenth century. This revolution, according to the so-called Roberts' thesis (Roberts 1967), was claimed to consist of a "revolution in tactics," the growth in army size and its impact on the burden of societies, and the adoption of more ambitious and complex strategies (Parker 1996). This historiographical formula is by now under heavy attack (Black 1990). Here we have to concentrate on the question what exactly gave Machiavelli's theory its novelty.

Innovative and Original Aspects

Perhaps the most important of Machiavelli's reform proposals is his advocacy of a permanent militia recruited from Florentine territory in place of foreign mercenary troops. This was radical for the times. The proposal is understandable both from the perspective of *The Prince* (where the author advises the prince to rely more on the *popolo* than on the *grandi* of his city) and from the perspective of the *Discorsi*, where the author takes a firm (ancient Roman) republican line (Zuckert 2017).

There are two further points of interest, however, in Machiavelli's position. One is that his narrator is Fabrizio Colonna, an Italian *condottiere*, whose earlier associations with Florence were quite antagonistic. One can interpret Machiavelli's decision to use Colonna in the key role in this work as an ironic twist. But it

can also be interpreted in a context of Florentine domestic politics: Machiavelli's choice must have been read as "an anti-Orsini and therefore as an anti-Medici gesture" (Colish 1998). Finally, as a humanist he would surely be aware that an often-used device of the genre the dialogue was to employ contemporary interlocutors, who were nevertheless put into improbable rhetorical situations.

Even more surprisingly, as in *The Prince*, Machiavelli in *The Art of War* also considers the possibility that a well-ordered and well-disciplined army might colonize further territories. The work also points out the potential of a militia to reorder the political regime at home by force. As for this second point, Machiavelli understood that political power could not be withheld from those who risked their lives for the *patria*, a military force based in the people empowered a popular regime. Unfortunately, his advice did not bear fruit(s) among its intended audience, his learned republican friends who met in the Rucellai garden.

Impact and Legacy

The Art of War was republished more than 20 times in the sixteenth century and was cited by important Renaissance authorities such as Montaigne and Francis Bacon.

Ascham, Roger

Born: 1514/15, Kirkby Wiske

Died: 1568, London

Tim Markey

Worcester Academy, Worcester, MA, USA

Abstract

This entry treats Roger Ascham (1514/15, Kirkby Wiske–1568, London) as a philosopher of literature, a modern phrase, to be sure, but a broad one meant to cover its large and mobile subject, whose literary philosophy lay conceptualized, as typical from the Middle Ages to the Italian Renaissance, within all intellectual pursuits, within, as it were, philosophy. Poetic, of course, was the invention of Aristotle, given a new lease on life with the recovery of Greek. The analysis centers on the section “*Imitatio” in Ascham’s posthumous *The Scholemaster* (1570). Chronology belies the ages-old habit of classing Ascham among early Tudor humanists. And if Ascham clearly

has more affinities with such humanists as the great Henri Estienne (II) in France and Fulvio Orsini in Italy than with Sir Thomas Elyot, he was a fortunate Hellenist to have been formed, by his own proud testimony, at Saint John's College, Cambridge. To say *humanist* or *humanism*, could Ascham have pronounced those words, is to express Ascham's implacable desire to build and improve upon in theory and practice a Continental and English tradition of classical learning and to return to the Greek and Latin *fontes et origines* for English poetry and poetics, the whole thrust and direction of these efforts, however, being in motion. The eye Ascham casts upon poetry and poetics, ancient and modern, is critical, taking as little as possible for granted, looking instead to bring back the intention, meaning, feeling, and effect of the author and work, word by word, place by place.

Heritage and Rupture with the Tradition

Roger Ascham a Renaissance philosopher? Within poetics, rhetoric, and literary aesthetics, Ascham wrote in English to educate the intellectual and ruling elite and begin or, in a Reformation England that had destroyed most of its university and monastic libraries, begin again a Renaissance along the deepest classical lines. Ascham's Latin and Greek were equal to the age; his literary critical thought sometimes surpassed it. The break with Medieval approaches to literature (while Ascham loved Chaucer) is so wide it goes without saying. Drawn from the ranks of Oxford and Cambridge, the schoolmaster in question is really the Roman *grammaticus* brought up to date.

Innovative and Original Aspects

What philosophy of literature did Ascham espouse? In the passages most accessible today, Ascham will impress as typically English: Ascham practically derived his myriad views and illustrated his sagacious taste out of major authors, duly quoted, gamely alluded to, and often enough interpreted, and theoretically founded his principles "left in Reversion [...]"

by Plato, Aristotle, and Cicero (Ascham 1570). To them add Horace, Quintilian, Servius, and Macrobius, while the need to read them in light of Ascham's lost library, of which only a handful of books remains, is an urgent desideratum.

Ascham's animating intellectual motives are at least twofold: an implacable commitment to, without a complete detailing of, the chief positions of poetic and rhetoric stated in The Praeface. Generally, Ascham is exploring and elaborating the *imitatio* of the Roman tradition alongside the *mimesis* of the Greek; he is a realist. But to those ends, Ascham assumes the relevance and power of the text in context, archeologically explored and discovered, objectively analyzed and interpreted; he is an historicist, as empirical as not. Second, though this is, *stricto sensu*, neo-classical, it is not *Le néoclassicisme* in France nor its effects in England poetics and poetry. Rather, Ascham endorses a canon of classical authors open to and welcoming further criticism and theory even as humanists were searching for and discovering them, in part or in whole. Virgil and Homer, Horace and Pindar, and Cicero and Demosthenes stand among the exemplars Ascham wants his reader, once or future writers, critics, and teachers, to follow *en pleine connaissance de cause* in their own terms and times.

Ascham is also an inveterate comparatist, firmly but undogmatically for incorporating Greek and Roman literatures, the personal culture of the (private) Renaissance museum; here was, moreover, the stimulus to a new English literature – across all genres – more fully and properly responsive to humanism. This duality of vision intercommunicates, each side irreducible to the other, both sides dialectical, *achieved through reading*: the reader, at once a theorist and a critic, observes and judges the text in at least a trilingual context – Greek, Latin, and Neo-Latin – since the great works of history, literature, and philosophy spring most impressively, in Rome, from two languages, both at once.

Impact and Legacy

Ascham is not merely in the literary critical line of Sidney, Jonson, Milton, and Dryden; he

found the line, as conversant with primary and secondary sources of classical tradition as any of them, decidedly more than Sidney or Dryden, as a brilliant and effective mediator and agent of humanist thinking and ambitions. Seemingly continuously read, Ascham is cited with ease in England (both in Neo-Latin and English) during the hundred years after his death, and Samuel Johnson eulogizes him in the eighteenth century as pioneering and canonical.

Ascham's greatest charge to Elizabethan England, "this worke of imitation" (Ascham 1570), critical and creative hands joined to make a Renaissance future out of classical works and pasts, may be his greatest legacy for all England. On a par with the best of Renaissance humanism, the sophistication exceeded all previous efforts in Tudor English.

Askew, Anne

Born: Lincolnshire, c. 1521?

Died: London, 16 July 1546

Elaine V. Beilin
Framingham State University, Framingham, MA,
USA

Abstract

During the last years of Henry VIII's reign, Anne Askew eloquently affirmed her evangelical faith and defied the heresy laws enforced by the Catholic church, the city of London, and the Privy Council. In her two works, *The first examinacyon* (1546) and *The lattre examinacyon* (1547), Askew recounts her interrogations and articulates her belief in the primacy of bible reading and the Reformist doctrine of the Eucharist. Refusing to recant, she was burned at the stake. After her death, the Protestant polemicist, John Bale, published her works, representing her as an icon of the English Reformation.

Biography

Little information exists about Askew's early life as the daughter of a Lincolnshire gentry family. John Bale provides some unverifiable details from unnamed sources, including her forced marriage to her late older sister's Catholic fiancé, Master Kyme, by whom she may have had two children. Askew herself records a visit to Lincoln to read the Cathedral bible and to confront a number of priests opposed to her conversion to an evangelical faith. London city records show her three arrests for questioning in 1545 and 1546, and in her *Examinations*, she addresses a reformist community, referring to well-known preachers like Edward Crome and Hugh Latimer. In June 1546, she was questioned by the Privy Council and sent to Newgate prison. Probably hoping to incriminate high-ranking noblewomen as heretics, Lord Chancellor Wriothesley and Sir Richard Rich tortured Askew on the rack, but could not break her silence. She died with three other accused heretics in Smithfield on July 16, 1546.

Heritage and Rupture with the Tradition

Like most evangelicals in the 1540s, Askew dissented from the Catholic doctrines proclaimed in the 1539 Act Abolishing Diversity of Opinions (the Act of the Six Articles) and advocated the reform of traditional worship. Although she affirmed the importance of the Eucharist, she condemned the doctrine of transubstantiation, arguing from scriptural citations that the bread and wine were remembrances rather than the real presence of Christ (Askew 1996, 99; Malson-Huddle 2010). She used the dialogue form and her considerable rhetorical skill to represent her debates with her interrogators, challenging their authority while claiming not to overstep restrictions on women's roles as public disputants (Askew 1996, 30; Beilin 1985, 1991). Writing to her evangelical community as a teacher or preacher, she resembles dissenters like Margery Kempe or earlier Reformist martyrs (Knott 1993; Watt 1997; Summit 2000; Gertz-Robinson 2005).

Innovative and Original Aspects

Essential to Askew's significance is her assuming the right to debate male authorities of church and state, a position she supports with her constant exegesis of the English Bible (McQuade 1994; Betteridge 1999; Linton 2006). Askew provides dramatic accounts of her questioning by various city, state, and ecclesiastic officials, most prominently Bishop Edmund Bonner and the Lord Chancellor, Sir Thomas Wriothesley. She vividly describes her confrontations, often suggesting the folly or ignorance of her questioners and gaining authority by associating herself with Saint Stephen, whose theology and persecution she implies are models for her own (Kennedy 2000, Monta 2003; Almasy 2005; Hickerson 2006). In *The first examinacyon*, her rhetorical strategies include questions, scriptural citation, and equivocation (Wabuda 1993; Graban 2007; Pender 2010). She upbraids an archdeacon for his hasty judgment and "slendre wytt" (Askew 1996, 43), even as she appears to defer to "so manye wyse lerned men" (Askew 1996, 54). She also assumes the role of teacher and polemicist by continually asserting, "I beleve as the scripture doth teache me" (Askew 1996, 49; Snook 2005). Indeed, Askew modeled "a particularly vigorous kind of scripturally oriented polemical and political language" (Loewenstein 2006, 14). In *The lattr examinacyon*, she relates the shocking scene of her brutal and illegal torture on the rack (Berry 1997; Matchinske 1998; Kemp 1999).

Impact and Legacy

The importance of Askew's texts is clear from the speed with which they were published and republished. The exiled Protestant polemicist, John Bale, oversaw their printing in Wesel with his introductions and extensive "elucidations." Claiming Askew's resemblance to an early Christian martyr, Bale uses her interrogation and execution as an opportunity for violent attacks on the doctrines and practices of the Catholic church (Kesselring 1998). Both *The first examinacyon* and *The lattr examinacyon*

include a frontispiece woodcut, an iconic Reformation image of a female figure in a simple robe, holding the Bible and the martyr's palm, and trampling a papal beast before a wall. Thousands of copies of Askew's work may have been circulating during Edward VI's reign (Fairfield 1976, 135). Both *Examinations* appear in John Foxe's influential and always available history of the English church, *Actes and Monuments*, and have been frequently adapted and republished (Beilin 2005).

Astrological Determinism

Universität Innsbruck, Innsbruck, Austria

Abstract

The idea that human destiny is predicted according to astrological and philosophical laws has been widespread since Antiquity. Strongly linked with the fate and fortune concepts, astrological determinism received new interpretations during the Renaissance period. The reason was a renewed interest in Cicero's treatises, as well as in Alexander of Aphrodisias and Stoic philosophy. On the other hand, the question of determinism seems to be closely related to religious and philosophical disputes of the sixteenth century.

Heritage and Rupture with the Tradition

In Ancient Rome, astrology often faced a severe opposition. The leading astrologer of Antiquity Claudius Ptolemy tried to avoid deterministic elements in his *Tetrabiblos* (also known as the *Liber Quadripartitus*), while Cicero and Plotinus opposed astrology from a philosophical point of view. However, the *ars divinatoria* remained very popular during the whole history of the Roman Empire. The fascination for astrology shown by the emperor Septimius Severus and his heirs forced Alexander of Aphrodisias to write a special anti-astrological treatise (Alexander of Aphrodisias, 1963). Alexander opposed the Stoic idea of determinism claiming that some

events did not have predetermined causes. He insisted that man is responsible for his own decisions, and that chance is a source for human freedom, since it allows to break the casual chain. Alexander's *De fato* was well known in the Middle Ages due to the translation by William of Moerbeke (Alexander of Aphrodisias, 1963). The supposition that all the events of human life could be strictly predicted using astrological tools was also strongly criticized by the Church Fathers. The most significant attack on astrology and determinism was Augustine's *De civitate Dei*.

In the Middle Ages, after the transfer of astrological and magical texts from the Islamic world into Europe in the twelfth and thirteenth centuries, European intellectuals faced an issue to tie astrological determinism with Christian dogmas. Albertus Magnus, Roger Bacon, and Pierre d'Ailly (to name but a few) tried to legitimate astrology within Christian theological agenda, which led to the formation of the so-called Christian astrology. However, their attempts did not solve a clear fundamental opposition between astrological determinism and Christian interpretation of human free will.

Renaissance scholars often insisted on using astrology and deterministic theories for religious purposes. Coluccio Salutati's *De fato* is a case: while rejecting astrology, he praised Seneca as a great moral and Christian philosopher and interpreted Stoic casual chain in a Christianized way. This approach was also typical for Marsilio Ficino, who was largely responsible for involving astrological sources in Christian religious discourse.

In his last treatise, the *Disputationes adversus astrologiam divinatricem*, Giovanni Pico della Mirandola severely attacked astrology (Pico della Mirandola, 2004); one of his main arguments dealt with determinism. According to Pico, astrologers are unable to provide their followers with correct and exact calculations. For him, predicting the future is exclusively in God's power. Pico's position was followed by Girolamo Savonarola, Gianfrancesco Pico della Mirandola, and other opponents to astrology. Pico's attack, however, did not find an unanimous support. One of his opponents was Pietro

Pomponazzi, the author of the famous *De immortalitate animorum*. Pomponazzi's doctrine of determinism was related to his negation of the immortality of the soul that consequently led him to the idea of the predestination of human life. In the *De incantationibus* and especially in the *De fato, fortuna et praedestinatione*, he explained his deterministic views, based on a radical reading of Aristotle (Pomponazzi, 2004). Pomponazzi defended Stoic determinism against Alexander of Aphrodisias preferring the Stoic casual chain to the Aristotelian teaching and Christian dogmas of divine providence and free will. Thus, Pomponazzi accepted astrological determinism and confirmed it using philosophical arguments.

Despite a number of attacks, such as that of Pico della Mirandola, astrology remained extremely popular over the whole sixteenth century. Dealing with its deterministic aspects, Renaissance scholars usually adopted either of the two aforementioned approaches: a Christianized interpretation of *fatum* or its interpretation in philosophical terms.

Astrological Medicine

Ovanes Akopyan

Centre for the Study of the Renaissance,
University of Warwick, Coventry, UK
Institut für Sprachen und Literaturen, Bereich
Gräzistik und Latinistik, Leopold-Franzens-
Universität Innsbruck, Innsbruck, Austria

Abstract

Astrology was considered to be an important tool for medical practices over the centuries. Since the twelfth century when European intellectuals got access to a great amount of previously unknown magical, astrological, and medical texts, the link between astrology and medicine had remained firm. Referring to the medieval tradition, Renaissance scholars at the same time enriched the astro-medical discourse with new interpretations and sources.

Heritage and Rupture with the Tradition

The idea to tie astrology with medicine was typical for medieval Islamic astro-medical treatises. Mostly translated into Latin in the twelfth and thirteenth centuries in Spain and Italy, they gave rise to a number of Western interpretations. The most significant elements of this astro-medical tradition are the so-called astrological images, i.e., talismans. Produced in accordance with astrological techniques and calculations, they had to be used for medical purposes absorbing positive celestial influences and thus healing patients. The practice to produce astrological images was described in detail in several medieval astrological texts, including the legendary *Speculum astronomiae*, whose authorship is still subject to scholarly debates (Zambelli 1992). Michael Scot (1175–c.1232), Albertus Magnus (c.1200–1280), Pietro d’Abano (1257–1316) were also responsible for the diffusion of astro-medical techniques. In the fourteenth century, it became a commonplace to interpret the plague from the astro-medical perspective (Weill-Parot 2002). Besides,

physicians were traditionally taught to take astrology into account in questions such as conception or nativity, the so-called critical days (crises in health or illness), and medication (Siraisi 1990, Pennuto 2008).

The medieval tradition played a crucial role in Marsilio Ficino’s astro-medical writings, including the *Consiglio contro la pestilenza* (completed in 1478 but published 3 years later) and the *De vita libri tres* (1489). Remaining somewhat loyal to the medieval astro-medicine, Ficino (1433–1499) and other Renaissance scholars did not keep off adding some novelties to the interpretation of how medicine and astrology might work together.

Innovative and Original Aspects

Two episodes significantly contributed to the modification of this link between astrology and medicine in the Renaissance. One is the attack of Giovanni Pico della Mirandola (1463–1494) on judicial astrology, expressed in his *Disputationes adversus astrologiam divinatricem* (published posthumously in 1496) (Pico della Mirandola 2004). Giovanni Pico rejected the divinatory aspects of astrology and accepted only its physical dimensions. He called it “natural astrology.” Eliminating any application of judicial astrology, he admits the influences exerted by physical means, that is, motion, light, and heat. Pico thus criticized the astrological aspects of numerous astro-medical doctrines. For instance, his attack had an immediate impact on the debates on critical days, which lasted through the whole sixteenth century.

Another influence was Marsilio Ficino’s *De vita libri tres* (Ficino 1998). In his third book, the *De vita coelitus comparanda*, Ficino gave his interpretation of astro-medicine. The book abounds in references to ancient Neoplatonism, specifically to Plotinus and Iamblichus, and contains ideas borrowed from late medieval alchemy, astrology, and natural magic. According to Ficino, a *magus*, having correctly mastered these teachings, can manipulate material objects in order to draw down the benefit of higher cosmic and

immaterial forces, through which he is united with the “world soul” (*anima mundi*). Ficino established an influential theory of the all-pervading “world spirit” (*spiritus mundi*), which unites the soul of the world to its body. From this perspective, the universe is conceived as a living being, and the correspondence and harmony between heaven and earth as its members are emphasized.

These episodes influenced the subsequent, sixteenth-century, theories of astro-medicine. Some Renaissance scholars, such as Nicolò Leonicensio (1428–1524), insisted on naturalistic grounds of medicine rejecting judicial astrology as such. The second trend based on Ficinian natural magic became more popular, with Jean Fernel (1497–1558) (Fernel 2005), Girolamo Cardano (1501–1576) (Grafton and Siraisi 2001), and Cornelius Gemma (1535–1578) trying to “Neoplatonize” ancient medicine, thus creating harmony between heaven and earth, which included the astro-medical dimension (Hirai 2011, 2014). This gave rise to a particular interest in Hippocrates’ and Galen’s writings and their Neoplatonically orientated readings.

Astrology in the Renaissance

Dorit Malz
Kunsthistorisches Institut in Florenz,
Max-Planck-Institut, Florence, Italy

Abstract

Astrology or the science of the observation of the heaven has ancient roots which can be traced back to the oldest history of mankind, but has been practiced by ancient Greeks and Romans, too. The oldest representation of the starry sky probably is the Nebra sky disk, dated to the Bronze Age (around 2100–1700 BC). In late antiquity, the seven liberal arts were canonized as the seven basic fields of study, among them astronomy, whereby the terms “astrology” and “astronomy” were widely used parallel and as synonyms (Dooley 2014; Heitzmann 2008).

Astrology considers the stars’ influence on humans and life on Earth. Observing the starry sky and in particular the movements of the planets (Moon, Sun, Mercury, Venus, Mars, Saturn, and Jupiter) and their relations to the zodiac signs (Capricorn, Aquarius, Pisces,

Aries, Taurus, Gemini, Cancer, Lion, Virgo, Libra, Scorpio, and Sagittarius), it was hoped to discover relations to events on Earth and to be able to predict and control catastrophes. Since antiquity, a distinction has been made between natural and judicial astrology. Natural astrology treats the relation between the movements of the celestial bodies and natural phenomena on Earth such as earthquakes, floods, or weather changes. Judicial astrology deals with the stars' influence on human fate. A central role plays the text of the Revelation of St. John (chapters 6 and 12) where an earthquake, a darkened sun, a blood red moon, and falling stars are announcing the Last Day (Schenk 2014).

In the twelfth century, there was an intensive involvement with astrological matters. Arabic handbooks were systematically translated into Latin. The planets were seen as soul-bearing entities serving as intermediaries between the upper and the lower world (Zambelli 2012).

Heritage and Rupture with the Tradition

During the Renaissance, ancient knowledge was revived by Latin translations of the old texts and the dealing with their contents but also because of the invention of letterpress printing. In this context, astrology experienced a revival, followed by a critical review, commenting, and later attempts for reformation. Epidemics (like the plague during the fourteenth century and syphilis during the sixteenth century), end times prophecies, and unstable political situations (such as wars) in the European area ignite the faith in a predictability of catastrophes. Consolation, counseling, and call for patience, as well as offering, which help humans in a world out of order, are essential components of astrological scriptures. The knowledge of the stars was extremely important for navigation, and furthermore, people in the early modern period regarded astrologers as experts in matters concerning daily life: They determined whether a woman was pregnant and predicted the number and the sex of children and were

counselors for marriages and investments. Letterpress printing played a crucial role in the dissemination of astrological scriptures. In large print runs and on cheapest paper, so-called almanacs were printed also for simple people with poor educational background. An almanac typically contained a calendar, including church festivals, feast days, and sometimes even a selective chronology of world history or a list of kings; information about the year's astronomical events; and a series of astronomical prognostications, including predictions about the weather, crops, health, and political and religious events. Most almanacs also contained astrological information concerning farming, such as the best time to plow, to plant, geld animals, harvest, and fell timber (Eamon 2014, 14).

It is not until the seventeenth century that astrology detaches slowly from scientific subjects. The reasons for the steadily decreasing interest in astrology are complex and have not yet been finally clarified. Apparently, the abandonment of the universities from astrology as academic subject, the prohibition by the Christian Church, and new scientific methods and developments should be mentioned in this context.

Relationship with the Church and Rulers

The church's relationship to astrology was problematic. In 1327, Cecco D'Ascoli was publicly burned in Florence for having cast the horoscope of Jesus (among other offenses). In 1563, astrology was forbidden by the Tridentine Council. Since this verdict was only obeyed half-heartedly, Pope Sixtus V in 1586 promulgated the bull *Coeli et terrae* against astrology where he declared that the future was God's exclusive domain and that astrology is one of the most dangerous manifestations of human pride. After Pope Sixtus V condemned the teaching of astrology, professors at the Jesuit University in Lisbon continued to teach courses on judicial astrology (Eamon 2014). For the year 1630, different astrologers had predicted the death of Pope Urban VIII. Initially, the Pope tried to avoid the prediction with various measures, but ultimately he proceeds

with rigor against astrologers and promulgated the bull *Inscrutabilis Iudiciorum Dei* (1631), which prohibits them to predict the death of a Pope or any of his family members (Dooley 2003).

Despite of the church's difficult relationship to astrology from the sixteenth century onwards to the eighteenth century, large church halls, especially those few that pointed southwards, were chosen in order to install expensive meridians ("heliometers") in the floor for exact measurement (Heilbron 1999). Astrology played an important role at the papal courts like those of Paul II (1417–1471, confessed to astrology in his public inaugural speech), Sixtus IV (1414–1471), Innozenz VIII (1432–1492), Alexander VI (1431–1503), Julius II (1443–1513, chose the day of his accession to the throne according to the position of the stars), and Leo X (1475–1521, honored the Neapolitan astrologer Agostino Nifo and in 1520 established a chair of astrology at the papal university of the Sapienza). Paul III (1468–1549) arranged his day's work according to astrological principles and was counseled by the astrologer Luca Gaurico (1476–1558), whom he later nominated bishop of Civiltà Castellana.

Many rulers paid astrologers for predicting the future and finding opportune moments for coronations, travels, marriages, the start of wars, signing contracts, and cornerstone ceremonies of all sorts. Astrologers were to be found at the courts of King Alfons X of Castile (1221–1284, "Alfonsine Tables"), Emperor Frederick III (1341–1377), King Matthias Corvinus of Hungary (1443–1490), Maximilian I (1449–1519) (astrologer Georg Tannstetter), the rulers of the Kingdom of Naples (astrologer Giovanni Gioviano Pontano (1429–1503)), Catherine de' Medici (astrologer Nostradamus, as of 1555), Queen Elizabeth I (astrologer John Dee (1527–1609), which had studied at the University of Cambridge), the Duke of Urbino (astrologer Paul von Middelburg (1445–1534), later bishop of Fossombrone), the Medici in Florence, the Fugger in Augsburg, Emperor Rudolph II in Prague (as of 1599 Tycho Brahe (1546–1601) court astrologer, followed in 1601 by Johannes Kepler, "Rudolphine Tables"), and the courts of

the Kings in France, England, Denmark, and Hungary. Leonello D'Este, Duke of Ferrara, dressed himself following the advice of his astrologer so that the choice of color favored the celestial influence on him (Eamon 2014 153; Heitzmann 2008 51ff).

Innovative and Original Aspects

At many universities (such as Bologna, Ferrara, Padua, Naples, Salamanca, Paris, Krakow, Wittenberg, Nuremberg), astrology was taught during the Renaissance, often related to the subjects mathematics and medicine. Almost every medical school in the Renaissance offered courses in astrology. Medical students were required to take astrology since each part of the human body was ruled by a particular sign of the zodiac, and therefore it was the physician's duty to understand how to read the heavens so as to prescribe drugs at the most favorable moment or to order phlebotomies to be done in the proper location and at the proper time (Eamon 2014).

Fundamental scriptures, which were rediscovered and translated in the Late Medieval times and on which the Renaissance astrology theories founded, are Marcus Manilius (early first century) and his didactic poem *Astronomica*, rediscovered by Poggio Bracciolini in the beginning of the fifteenth century. Also Marsilio Ficino and Lorenzo Buonincontri (an astrologer in Lorenzo de' Medici's court) refer likewise to the didactic poem of Manilius. Important, too, were the scriptures of the Persian mathematician, astronomer, and astrologer Abu Ma'shar (about 787–886), which have been translated into Latin and disseminated as manuscripts already in the Middle Ages. In 1230 Georgius Fendulus compiled different texts by Abu Ma'shar which dealt with descriptions of the planets and the zodiac signs. *De magnis conjunctionibus et annorum revolutionibus ac eorum profectionibus* was published in 1489 in Augsburg and in 1515 in Venice. According to Abu Ma'shar, the heavenly destiny is not avoidable and any human influence on it is impossible (Blume 2014). Ptolemais (second century) describes in his *Tetrábiblos* the

effects of the celestial bodies on humans and their destiny. The Arabic text *Picatrix* has been translated in Latin in 1256. It associates stones, animals, and plants with the different planets, the zodiac signs, and human parts of the body and is as important for Renaissance theory as the *Corpus Hermeticum* by Hermes Trismegistos, which was translated by Marsilio Ficino for Cosimo de' Medici (1463) and which was thought to be a compilation of the oldest knowledge with allusions to Christian elements. The famous Florentine chronicler Giovanni Villani (1276–1348) explains numerous vicissitudes of his home city with astrology. For him the movements of the planets were the cause of many historical events. Already Francesco Petrarca (1304–1374) in 1362 had requested to combat lying astrologers and prophets defrauding people of their money and frightening them with false predictions (*Resenilium*, liber I, 6). In the fourteenth century, it was a widespread belief that knowledge rules the stars (p.e. Roger Bacon) (Garin 1982; Ritter 1962). From 1350 Giovanni Boccaccio (1313–1375) worked on the fundamental treatise on ancient mythology *Genealogie Deorum Gentilium* in which he explains the ancient myths as poetical descriptions of astrological constellations. Marsilio Ficino (1462–1525) in *De Triplici Vita* (1489) describes the influence of universe's activity as a one-way direction: from above to below. Impulses flow continuously down from the upper sphere and maintain and keep moving the earthly sphere. Human beings, since birth, are inseparably connected with a planet and with an associated character, but within these restrictions, they can choose freely. Free will plays an important role in the thought of Ficino; behind the natural origin, he recognizes a spiritual one which lets humans rule above themselves (*Theologia Platonica*) (Cassirer 2013). For Pietro Pomponazzi (1462–1525), astrological causality becomes a condition for understanding nature. All historical development and every natural being and becoming is influenced by the force of the stars (Cassirer 2013).

The famous Italian humanist Giovanni Pico della Mirandola (1463–1494), which in Florence had close contact to Lorenzo de' Medici, Marsilio

Ficino, and Angelo Poliziano, underlined in his speech *De hominis dignitate* (published in 1496, originally without title) the individual determination of human beings caused by free action. Human's destiny is not flowing from above, from the stars, but it arises from its inner depth. In his last years of life, he was influenced by Savonarola and argued in his *Disputationes adversus astrologiam divinatricem* (published posthumous in Bologna in 1496) that already Plato and Aristotle did not consider astrology as science. He continues that only in rare cases predictions of astrologers had come to pass and most of the contemporary astrologers are uneducated. Only the Sun and the Moon would have some influence with their rays, but not the stars and neither the zodiac signs. The influence of the planets, he says, is controversial and in general it is often not possible to determine the exact position of the planet and zodiac signs. Pico's condemnation on astrology was grounded upon a defense of human freedom against astral determinism. Paracelsus (1493–1541) set out the influence of the heavenly bodies as one of the causes for diseases (*Paragranum*, 1529). Tommaso Campanella (1568–1639) in 1602 wrote the *City of Sun* (published in 1623), a dialogue which explains a city built after astrological principles. Galileo Galilei (1564–1642) remains skeptical about astrology for nearly his whole life, but nevertheless we can find traces of astrological ideas in his writings (Rutkin 2005). In Wittenberg/Germany astrology, ideas are influenced by Martin Luther (1483–1546) and his reformation efforts. He called astrology an implausible science (Brosseder 2005). The Lutherans used astrology as a weapon against the Catholics; they condemned the Pope with their confessional marked interpretations and predicted his downfall. They appreciated the fact that God would announce his punishments. In this way people could get used to the catastrophe or the upcoming end or even calm the anger of God. Luther's closest confidant Philipp Melancthon (1497–1560) has been one of the many convinced followers of astrology in Wittenberg. In 1530, together with Luca Gaurico, he tried to write an interpretation of Luther's year of birth. In his

scripture *Initia doctrinae physicae* (published in 1549), he postulates that the stars should be read as signs as expressed in Genesis 1:14. Girolamo Cardano (1501–1576) compiles in his *Libelli duo* (published in 1543) 67 horoscopes of famous personalities (like Cicerone, Petrarch, Erasmus, Pico della Mirandola, Albrecht Dürer, Luther, Savonarola, Pope Leo X, Pope Paul III, Charles V, Francis I) as of various cities (like Venice, Milan, Florence, and Bologna). Johannes Kepler (1571–1630) published in 1609 his text *Astronomia Nova* in which he expressed his rejection against juridical astrology. He gives three reasons for human fortune: the constellation of stars, human's free will, and God. At the same time, he makes the famous comparison between astrology and astronomy which are related as mother and daughter, while the very wise, but poor mother (astronomy) is nourished by her foolish daughter (astrology) (*De stella nova*, 1606, chapter 12). He did not doubt the influence of the planets and their movements on Earth, and at the same time, he casted horoscopes and predictions on the court of Rudolph II. Francis Bacon (1561–1626) argued in favor of the separation between astrology and astronomy. In his opinion, the astrologic knowledge was a fact, but had to be reformed. He did not contradict the idea of the relation of human microcosm and heavenly macrocosm.

Famous predictions were made during the sixteenth century. In 1524, many astrologers interpreted the 16 conjunctions of planet in the zodiac sign of Piscis as a sign for a big flood. This causes a large debate about floods, but the predictions did not fulfill (Talkenberger 1990). The astrologer Luca Gaurico (1476–1458) prophesies correctly to Cardinal Alessandro Farnese that he will become Pope. After his election as Pope in 1534, Farnese made Gaurico his court astrologer, and it is said that he correctly predicted the year of the Pope's death. Gaurico but also Michel Nostradamus (1503–1566) predicted Catherine de'Medici's death of her husband Henry II in 1559.

Katarchic horoscopy was practiced for choosing the most opportune moment for private or public actions, such as the foundation of a new

building (like the new tower of the Benedictine abbey of Niederaltaich/Germany in 1514 or the foundation of the University of Wittenberg in 1530) (Hübner 2014).

Visual Arts

In the visual arts, the first astrological imagery after the Late Antiquity can be found at the court of the Hohenstaufen emperor Frederick II (1194–1250) in Southern Italy at the beginning of the thirteenth century. In the 1230s, Georgius Fendulus compiled the texts of Abu Ma'shar to develop images of the most important celestial bodies which were corresponding with the new knowledge of Arabic astrology. Aiming to show the power and influence of the planets, these were represented as medieval rulers in royal clothing. From around 1310 are the frescoes of the Great Hall in the Palazzo della Ragione, Padua by Pietro D'Abano and Giotto. The decoration shows the seasons of the year and the works of the month with the zodiacal signs. The theatrical images depict the planets at the various activities in front of a dark blue sky. Astrological cycles of the planets in the painted decorations of the representative buildings can be found in many Italian city-states like the Florentine bell tower (1324–1341, workshop of Andrea Pisano), in the framing of the paintings in the Sala dei Nove in the Palazzo Pubblico of Siena (completed by Ambrogio Lorenzetti between 1337 and 1340), in the capitals of the loggia of the ground floor of the Doge's Palace in Venice (around 1341–1355), and in the pedestal zone of the Paduan cloister of the Chiesa degli Eremitani. From 1420 onwards, Cosimo Vecchio de'Medici gave order to build his family chapel in the Old Sacristy of San Lorenzo in Florence. The ceiling of the chapel, finished with the help of the Florentine astronomer Paolo del Pozzo Toscanelli (1397–1482), shows a reproduction of the starry sky on a given day (4 July 1442). After 1450, a family chapel with a similar ceiling decoration was commissioned by Andrea Pazzi and his sons in Santa Croce in Florence. Between 1449 and 1457, Sigismondo Malatesta

commissioned the Tempio Malatestiano in Rimini, a sepulchral church with figural reliefs by Agostino di Duccio showing planet gods besides Virtues, Sibyls, and Prophets, the liberal arts, and the muses. In the tradition of the planet's children (i.e., persons who have a practically familiar connection to a particular planet, which rules their horoscope and determines their character), a very richly illuminated manuscript was prepared between 1450 and 1460 for Francesco Sforza, Duke of Milan, and around 1460, the famous copper engravings for the Medici in Florence, attributed to Baccio Bandinelli, were made. The frescoes of the Salone dei Mesi in the Palazzo Schifanoia, Ferrara (around 1470), are dedicated to the year and the relative stellar influence. In the ceiling of the Loggia di Galatea in the famous Villa Farnesina in Rome, the banker Agostino Chigi hired Baldassare Peruzzi to paint his personal horoscope in about 1510–1511 (Blume 2000, 2014).

Astronomical Instruments, Renaissance

Matteo Cosci

Università Ca' Foscari Venezia, Venice, Italy

Abstract

Although not all the traditional instruments enjoyed a contemporaneous parabola of fortune, it is possible to include the following items in a sufficiently comprehensive Renaissance astronomical equipment list: the quadrant, the *triquetrum*, the astrolabe, the armillary sphere, the nocturnal, Jacob's staff, the sextant, the *equatorium*, and the celestial globe. Unsurprisingly, it was the telescope that turned out to be the actual game-changer in the observational field.

Innovative and Original Aspects

The majority of the Renaissance astronomical instruments were slowly developed from their ancient or Medieval equivalents as borrowed

from the Arab-Islamic culture, whose centuries-old sailing activity across the Mediterranean Sea put into practice many devices for contingent navigational purposes. In fact, pre-telescopic astronomical instruments were mostly used to *locate* the relative position of celestial bodies in the skies (for the seek of orientation) and following their movements, rather than to understand the nature of the observed phenomena (Turner 2001; Egler 2006). However, in many cases the so-called pre-telescopic instruments had an uninterrupted use also after the invention of the telescope (c. 1608, the actual game-changer device), and in many cases their origin can be traced back to their Ptolemaic descriptions (second century AD) if not before.

During the Renaissance, such observational instruments were often regarded as fully fledged inventions as such that did not require any kind of improvement but only “philological” replication, thus remaining almost identical in their peculiar design and functioning for a long time. Only after the tampering intervention of Tycho Brahe, they started to be seen as proper working tools rather than unchangeable artifacts to be preserved as they were, and so they started to be consequently handled as perfectible, combinable, and even dischangeable pieces of technology.

Although not all the traditional instruments enjoyed the same success, it is possible to include the following items in a sufficiently comprehensive Renaissance astronomical equipment list: the quadrant, the *triquetrum*, the astrolabe, the armillary sphere, the nocturnal, Jacob’s staff, the sextant, the *equatorium*, and the celestial globe.

A quadrant (“one quarter of a circle”) is a kind of protractor that is used to measure angular altitudes of celestial bodies, up to 90° , by the aid of a plumb line. These instruments ranged from being small handheld tools to very large, permanently mounted devices, such as Copernicus’ meridian quadrant or Tycho Brahe’s mural structures (up to 6-ft long, reaching the notable, alleged precision of about 10 arc sec).

The *triquetrum* (literally, the “three-cornered”) or “parallactic ruler” was made of three long pieces of wood: the first is perpendicular to the horizon, the second is connected at the head of the

first with an axis, and the third which has the chord division is nailed near the base. Originally the triquetrum was first described by Ptolemy in his *Almagest* (hence its other name: “Ptolemy’s ruler”), and it was used for determining altitudes of heavenly bodies, as the zenith distance and parallax of the Moon.

The planispheric astrolabe was widely used in Europe in the late Middle Ages and Renaissance via the Moslem Spain, peaking in popularity in the fifteenth and sixteenth centuries, and was one of the basic astronomical education tools for the teaching of astronomy. From Geoffrey Chaucer’s treatise on the use and importance of astrolabe (1319) to Johannes Stoeffler’s *Elucidatio fabricae ususque astrolabii* (1512) and after, books on the subject increasingly proliferated, up to a point where “astrolabe” designated a specific literary genre on its own, in parallel with the increasing demand of astrolabe manufacturing and supplying all over Europe. Brass, wooden, and even paper astrolabes were developed for private use, and they were set also on tower clock in public squares, like in the case of the Prague mechanic astrolabe clock (1410).

The Renaissance version of the armillary sphere consisted of a small central sphere indicating the Earth surrounded by a number of rings (*armillae* in Latin) representing the celestial spheres (ecliptic and zodiac included) as the ancient models, but it was improved in precision of its grading scales and equipped with viewfinders for observational purposes.

A nocturnal (also known as nocturlabe or *Horologium nocturnum*) is an astronomical instrument used to determine the local time based on the relative positions of two or more stars in the night sky (usually they were two stars in the Ursa Major, Dubhe e Merak, as related to Polaris). Knowing the nighttime was a very critical issue in piloting ships in the dark for calculating tides, and in fact some nocturnals incorporate also tide charts for important ports. Although Raymond Lull repeatedly described the use of a *sphaera horarum noctis* or *astrolabium nocturnum* in his Medieval times, it was not until that publications like Martín Cortés de Albarcar’s *Arte de Navegar* (1551) and Peter Apianus’

Cosmographicus Liber (c. 1539, republished later by G. Frisius) came out that the name and the instrument gained a larger popularity.

Jacob's staff (also known as cross-staff, or fore-staff, or balestilha, or *radius astronomicus*) is a cruciform stick with length markings, consisting of a single long rod and a movable (and often interchangeable) crosspiece, that was used in Renaissance astronomy and before for measuring the angular separation of two stars, or of a star and a planet, and thus to accurately determine the position of the object in the skies. Levi ben Gershon (Gersonides) is credited to be the inventor of Jacob's staff, as attested by his treatise on its use, *De Sinibus, chordis et arcibus, Item Instrumento Revelatore Secretorum* (1329), as translated into Latin by Petrus of Alexandria in 1342. During the sixteenth century, astronomers such as Metius, Frisius, Regiomontanus, Werner, and mostly Digges improved their own version of the instrument, until it was later replaced with the more precise sextant by Brahe.

The sextant is an instrument originally used in navigation for measuring the altitude of the Sun or a celestial body above the horizon at sea: from the Sun's altitude at its passage on the meridian, the user could compute the latitude of the observation point by means of numerical tables. Brahe described the making of one of the first framed prototypes, built by Paul Wittich and designed by himself, for the observatory of Cassel. Part of the fortune of such instruments, as those built by Jobst Bürgi at the beginning of 1600 in Prague, was linked to their improved practicality and portability.

The *equatorium* is a calculating instrument, consisting of several rotating disks, used to determine the longitude of one or more of the planets at any given time according to the Ptolemaic planetary system. Due to difficulty in its precise design, it was a very rare type of instrument to build, and its construction became a display of skillful technique for few engineers. Moreover, *equatoria* were harder to use than astrolabes, and the astronomical theory underpinning them was less intuitive for the general public. Given its specialist function, this kind of instrument was used for those astrological aspects often related to medical issues.

A celestial globe is a three-dimensional, spherical, scale model of the vault of heaven, used as visual reproduction of the visible nighttime skies. Celestial globes helped to put constellations into perspective and served as scientific instruments, ornamental showpieces, teaching aids, and physical illustrations of the state-of-the-art astronomy. As scientists and astronomers became more acquainted with the sky and objects in it, celestial globes became more and more detailed and accurate.

Astronomy

Pietro Daniel Omodeo

History of astronomy and philosophy, Max Planck Institute for the History of Science, Berlin, Germany

Abstract

In order to understand Renaissance astronomy, it is expedient to locate it, as a *mixed science*, in the cultural system of the time, in particular among the other mathematical disciplines of the *quadrivium*, and in relation to physical astronomy. Moreover, it is worth considering its internal partitions, beginning with the distinction between theoretical and practical astronomy. In

close relation to its university teaching, a canon of sources was established (the so-called *corpus astronomicum*, together with a *corpus astrologicum*). During the Renaissance, astronomy underwent momentous transformations, initiated by mathematical humanists such as Georg von Peurbach and Johannes Regiomontanus. As major steps in the development of the discipline, one shall indicate Copernicus’s work and the heliocentric planetary theory, debates on comets and cosmological space, telescopic astronomy after Galileo, and the physicalization of astronomy after Kepler. Among wider cultural aspects, the criticism of astrology and the socioeconomical factors that supported astronomical studies are here mentioned.

During the Renaissance, astronomy was one of the so-called mixed sciences. Like optics, mechanics, and music, it used mathematical demonstrations to account for physical phenomena. These disciplines were distinguished from *pure* mathematics, arithmetic and geometry, dealing with quantities *per se*, discrete and continuous, respectively. In the university curricula, astronomy counted as one of the liberal arts of the *quadrivium* (alongside arithmetic, geometry, and music). Specifically, it was the mathematical discipline dealing with continuous quantities in a “comparative manner” and “relative to motion,” since it dealt with the ratios of celestial motions (Table 1). It was complemented by physical astronomy, which was the part of natural philosophy mainly resting on Aristotle’s *De caelo*. Whereas mathematical astronomy dealt with the *quia* (or τὸ ὅτι), that is, the description of the heavens by mathematical means, natural philosophy accounted for the *secundum quid* (or διότι), that is, it offered causal explanations of the same heavenly phenomena. Natural philosophy, or *physica*, dealt with cosmology and its fundamental concepts, such as space, place, time, eternity, infinity, celestial matter, and void. During the Renaissance, the boundaries between mathematics and physics were progressively blurred until a unified mathematical celestial physics emerged.

Astronomy, Table 1 The place of astronomy within the four mathematical arts of the *quadrivium* according to a standard scholastic taxonomy, still adopted by Christopher Clavius in his widespread introduction to spherical astronomy

Divisio mathematicarum		
Quantitas	Per se, seu absolute	Comparative, seu mobilitate
Continua	Geometria	Astronomia
Discreta	Arithmetica	Musica

Mathematical astronomy, or the “science of the celestial bodies” (*scientia de rebus coelestibus*), was constituted of two parts: theoretical and practical. The former (*astronomia theorica sive contemplatrix*) dealt with celestial motions, their modeling and parameters. It comprised the study of the fixed stars as well as planetary theory and accounted for planetary stations and retrograde motions, conjunctions, and eclipses. It relied on works such as Ptolemy’s *Almagest* and Nicholas Copernicus’s *De revolutionibus orbium coelestium* (1543), as well as, to a minor extent, on Georg Peurbach and Johannes Regiomontanus’s *Epytoma in Almagestum* (1496). Mathematical astronomers were also concerned with the description and perfection of instruments such as astrolabes, quadrants, *torqueta*, and trigonometric measuring instruments. Furthermore, these practitioners were able to use astronomical tables, for instance, the *Alfonsine tables* and Erasmus Reinhold’s *Prutenicae tabulae* (1551) based on Copernican parameters, to compute ephemerides and almanacs, which were printed in large number.

The other partition of astronomy, the practical one, coincided with judiciary astrology (*astronomia practica, judiciaria, seu prognostica*) and dealt with prognostications of celestial effects on sublunary events. It rested on Ptolemy’s *Tetrabiblos* as well as on a wide range of Hellenistic and Islamic sources. Its main field of applications was medicine, since the successful use of medicaments and medical treatments as well as the course of the illnesses was deemed to depend on astral influences. Meteorology and agriculture were also seen as dependent on

astrology. Predictions (in the form of interrogations, elections, and judgments) could also be used as an advice for action and even for political analysis and forecasts.

Beginning in the thirteenth century, university teaching led to the gradual codification and establishment of a *corpus astronomicum*. This is witnessed by the standard choice of reference sources bounded together in medieval codices on astronomy. They included *De sphaera* and *Theoricae planetarum* as general introductions, texts on time reckoning (*computus*), and on the calendar as well as *tabulae* and *canones* offering the means for celestial predictions. Similar multi-textual anthologies were printed in Renaissance. For instance, the Venetian printer Luca-Antonio Giunta issued in 1531 an astronomical collection bringing together Sacrobosco's *De sphaera*, Gerard of Cremona's *Theoricae planetarum veteres*, Peurbach's *Theoricae novae planetarum*, al-Bitrūjī's physical astronomy, *Planetarum theorica physica rationibus probata*, and other canonical sources. In parallel, especially in the fifteenth century, a sort of *corpus astrologicum* emerged. It especially comprised a great deal of Islamic sources, among them general summaries such as Haly Abenragel's *De iudiciis astrorum* or shorter texts such as Messahalla's *De revolutionibus annorum mundi* and Zael's *De interrogationibus*.

Mathematical astronomy had momentous developments during the European Renaissance. These began with the Humanistic movement and the recovery of classical sources in astronomy. The very influential Greek Cardinal Bessarion encouraged the study and translation of the *Almagest* directly from the original. Under his auspices, Peurbach and Regiomontanus realized a summary of Ptolemy, the *Epytoma*, which expounded the technicalities of the most important source of ancient astronomy. The *editio princeps* of the *Almagest* appeared in Basel, in 1538, preceded and followed by Latin editions, among them, Gerard of Cremona's medieval translation from the Arabic (Venice, 1515), George of Trebizond's fifteenth-century version from the Greek (Venice, 1528), and Reinhold's Greek-and-Latin edition of the first book (Wittenberg, 1549). As an

accomplished humanist, Regiomontanus also planned to set up a scientific printer in Nuremberg but his editorial projects, aimed at the restoration and improvement of mathematical knowledge, were interrupted by an untimely death.

Regiomontanus's restoration proved fundamental for later developments, in particular, for Copernicus's project of an astronomical reform. His major work, *De revolutionibus*, is a milestone in the history of science. It improved planetary theory in many respects, offered a new synthesis of the discipline that could stand comparison with Ptolemy, and propounded a modern version of the heliocentric planetary theory ("► [Copernicanism](#)").

To be sure, planetary theory was not the only controversial issue in the astronomical debates of the Renaissance. Very importantly, heated discussions over the location and *nature* of comets and novae ("► [Comets](#)") had far-reaching cosmological implications. The debates on the comet of 1577–1578 and the *stellae novae* of 1572 and 1604 are particularly well known for the involvement of leading scholars of the time, like Michael Mästlin, Tycho Brahe, Johannes Kepler, and Galileo Galilei. Accurate observations of these phenomena demonstrated their supralunary location. This undermined the Aristotelian conception of the heavens as the realm of unchangeable perfection and paved the way to new cosmologies assuming the fluidity of celestial space and the principle of cosmological homogeneity. Also due to these results, the 1580s witnessed to the expansion of natural philosophical debates on the heavens. Among others, Brahe's geo-heliocentric system ("► [Geocentrism](#)") presupposed the fluidity of heavenly space to account for such features as the intersection of the deferents of Mars and of the Sun. In the same years, the Copernican philosopher Giordano Bruno defended the view that the universe is infinite and populated by countless heliocentric systems similar to ours. His infinitism was to influence later conceptions of cosmological space, beginning with René Descartes's *indefinite* and polycentric universe.

An impetuous advance in the techniques of observation and in observation-based theory marked the sixteenth and seventeenth centuries,

as well. While Copernicus's observations were sporadic, Brahe inaugurated teamwork systematical collection of data at his castle observatory of Uraniborg, on the Danish island of Hven. His data served as a basis for Kepler's subsequent work, in particular as an empirical basis for the determination and testing of the heliocentric model of Mars's orbit in the *Astronomia nova* (1609). Moreover, the publication of Galileo's *Sidereus nuncius* launched telescopic astronomy in 1610. It communicated the observation of the lunar asperities and of new celestial bodies, namely, the four Medicean satellites of Jupiter. The telescopic observation of the phases of Mercury and Venus made Ptolemaic geocentrism definitively obsolete, while the sunspots confirmed the rotation of the solar body as well as the "mutability" of the heavens, *pace* Aristotle.

The astronomical work of Kepler deserves particular mention as the substitution of a kinematic treatment of planetary motions through geometrical modeling for physical astronomy, that is, the explanation of celestial motions as resulting from the action of forces. After the dissolution of the celestial spheres of the medieval tradition in the 1580s, the question about the causes of the celestial motions was raised. Kepler was not satisfied with vitalistic and *psychological* accounts allotting to planets (and their souls) an inner impulse (as was the case for Francesco Patrizi and Bruno, among others) or post-Aristotelian *metaphysical* accounts resorting to "separate intellects" regulating the trajectories of each planet (as was the case for "Tychonians" like Christian Longomontanus). Rather, Kepler pointed to the motive force emanating from the Sun as the unitary cause of celestial motions and the nonuniformity of their speeds.

In the scientific culture of the Renaissance, mathematical astronomy and astrological practice were intertwined and mutually supportive. Still, beginning with the late fifteenth century, the criticism of astrology for philosophical, religious, and political reasons progressively eroded the consensus earlier accorded to astrology. Giovanni Pico's *Disputationes adversus astrologiam divinatricem* (printed posthumously, in 1496), Jean Calvin's *Advertissement contre l'astrologie*

judiciaire (1549), or Jean Bodin's anti-astrological considerations, in *Les six livres de la république* (1576), are landmarks of this pre-Enlightenment criticism of superstition. Some religious and political authorities started prohibiting astrological practice, for instance, Sixtus V in 1586. In Germany, astrology benefited from great popularity, also due to the lasting influence of the Lutheran *praeceptor Germaniae*, Philip Melanchthon, who regarded this discipline as the science of Divine Providence. Later, the affirmation of mechanistic conceptions of nature and medicine led to the marginalization of astrology from the culture of the European elites. This dismissal also paved the way to the Enlightenment criticism of this practice, beginning with Pierre Bayle's *Pensées diverses sur la comète* (1680).

Several socioeconomical and cultural factors account for the momentous developments of astronomy during the Renaissance. Among them, navigation and geography had economical and political preeminence, following the interests of the Atlantic European powers. In fact, astronomical knowledge was essential for oceanic transits and for the mapping of lands thus far unknown to the Europeans. Astronomical and geographical competences often merged in the so-called *cosmographia*. Moreover, the reliance of Galenic and Paracelsian medicine on astrology fostered astronomical studies. Due to this interdisciplinary tie, astronomy remained a fundamental discipline in the Faculty of the Arts, as propaedeutic for the study of medicine, but was seen as basic knowledge also outside the learned elites by less orthodox medical practitioners. Among the civil and religious factors, the calendar reform was perceived as particularly urgent. An emendation was necessary to accord festivities and celestial motions (in particular the determination of Eastern, which had to be celebrated on the first Sunday after the first full moon after the spring equinox). For the Catholics, this reform was eventually devised by Christoph Clavius and promulgated by Gregory XIII, in 1582. In those years, confessional elements played a role as a background of scientific investigation. This is evident in the religious and political concerns underlying the scientific *curricula* at Jesuit colleges, or the influence of

Melanchthon's support of mathematics and of astrology over German reformed universities. Moreover, while Catholic censorial practices, most notably the prohibition of the Copernican planetary theory, rebounded on teaching and scholarly practices *in negativo*, it also provoked attempts to reconcile theology and astronomical novelties as a reaction, especially in the reformed Countries.

Atheism in the Renaissance

Eric MacPhail

French and Italian, Indiana University,
Bloomington, IN, USA

Abstract

Atheism was not a philosophical position in the European Renaissance. No university hosted a disputation on the question *an sit Deus*. Nevertheless, atheism was a widely described and decried phenomenon in sixteenth-century Europe, especially in the context of confessional strife and religious civil war. Atheism can best be understood for this period as an experience of social ostracism that continues to elude historians and philosophers alike.

Heritage and Rupture with the Tradition

The historian of philosophy Winfried Schröder categorically affirms “l’extrême marginalité de l’athéisme au début des temps modernes” (Schröder 2005, 43) and counts no atheist texts in circulation in Europe before the *Theophrastus redivivus*, an anonymous manuscript dated 1659. This is an unpromising introduction to our topic and would seem to void the category of Renaissance atheism, much as Lucien Febvre famously declared the Renaissance mentally unequipped to conceive of atheism, in a monograph first published in 1942 and often reissued since (Febvre 2003). Though marginal to the history of philosophy, Renaissance atheism evoked a great deal of anxiety and a fair amount of theorizing from religious and political thinkers of the sixteenth century who regarded atheism, in the sense of alienation from confessional identity, as a ubiquitous danger in a time of religious persecution and coercive orthodoxy. The place to look for early modern theorizations of atheism is the debate on religious tolerance that flourished through the long course of a century of religious conflict and controversy.

We can begin with the situation in the Low Countries in the 1540s, when many new converts to the Reform sought to conceal their true confessional identity in order to maintain their social status within a Catholic realm and a Catholic social order. This phenomenon, known as Nicodemism, had reached sufficient proportions by 1543 that Jean Calvin thought it necessary to compose a vernacular treatise showing what the faithful are to do when living among Roman Catholics (Calvin 1867). Calvin’s explicit condemnation of attendance at the Catholic Mass provoked a crisis to which the Strasbourg Reformer Valérand Poullain bears a key testimony that can help us relate the early modern usage of *atheism* to the problem of religious tolerance. In a letter dated March 9, 1544, Poullain reports to Calvin about dissension among the faithful caused by Calvin’s *Petit traité* in the Flemish Low Countries (Herminjard 1966, 9:178–181). Poullain himself had assured the diffusion of Calvin’s treatise throughout that region, and therefore he feels some responsibility for the demoralizing effect produced by Calvin’s intransigence. Poullain remembers that, when he preached in the Flemish Low Countries, he recommended attending those public gatherings, “coetus publicos illos,” because he believed that such meetings, though tainted with superstition, brought together many who feared God and confessed Christ. He did so above all because he feared that otherwise, if they followed Calvin’s advice to the letter, they would become atheists: “Idque adeo faciebam, quod vereretur ipsos omnino fieri ἀθεοῦς, quod jam in plaerisque perspexeram” (Herminjard 1966, 9:179). In this remarkable testimony, the Greek term ἀθεός designates an outcast. When theism is a form of community, atheism is a sort of excommunication, one that results, moreover, from intolerance.

The next phase in the conceptualization of atheism involves Sebastian Castellio and his campaign for religious tolerance in the aftermath of the execution of Michel Servet in Geneva in 1553. Castellio and Calvin engaged in a furious debate about the persecution of heretics with the Basel humanist insisting that if you inflict the death penalty on heretics, then there will be a universal slaughter, for everyone is someone else’s

heretic. Atheism, as he argues in his *Contra libellum Calvinii*, is a different story. Whereas Calvin would abusively conflate heresy and atheism, Castellio would strictly segregate the two terms and authorize persecution only of atheists, not heretics (Castellio 1612). In this context, atheism defines the very limits of religious tolerance. Castellio never questions the primordial value of theism, nor does he acknowledge any intellectual argument against theism. What he challenges is the enforcement of religious orthodoxy, which naturally exposed him to suspicions of atheism.

Innovative and Original Aspects

Whereas atheists may not qualify for tolerance, tolerance itself can ward off atheism. This is the argument that emerged to great prominence in the course of the French Wars of Religion, beginning with the pamphlet literature that started to circulate even before the first War broke out in 1562. One of the most striking arguments in this debate, given widespread currency by Jean Bodin in his masterpiece of 1576 *Les six livres de la République*, was that the prince should never force the conscience of his subjects, for intolerance is likely to breed atheism (Bodin 1961, 655). If you deny people the exercise of their own religion, they will abjure all religion and lose the fear of God. Once people lose the fear of God, they will stop at nothing; they will trample on all law and civil authority. In short, intolerance breeds atheism and atheism breeds impunity, which is the downfall of the state. This is a paradigmatic argument of the writers and statesmen in late sixteenth-century France known as the *politiques*, who understood atheism as the loss or rather the confiscation of confessional identity.

While France was consumed with civil war, the nascent Dutch Republic witnessed its own debate over religious tolerance and the coercion of belief. The featured debaters were Dirck Coornhert on behalf of religious tolerance and Justus Lipsius advocating the repression of religious dissent. Responding to a sequence of chapters from book four of Lipsius' *Politicorum libri sex* of 1589 (Lipsius 2004, 386–396), Coornhert composed his *Trial of the Killing of Heretics and the*

Constraint of Conscience which appeared in September 1590 followed in October by Lipsius' rejoinder *Adversus dialogistam liber de una religione*. In the *Trial*, Coornhert identifies religious faith, which some have and others lack, as a gift of God. The one who lacks faith or loses it under pressure of persecution is disfavored but not disobedient, and his dilemma merits pity not punishment. Appealing to the principle of justice that is constitutive of divinity, he argues that belief and unbelief are not voluntary acts to be judged innocent or guilty. Unbelief is not a misdeed but a misfortune like a disinheritance and therefore not subject to legal sanctions (Coornhert 1630, 2:86–87). In this sense, unbelief is like dissent since it can claim the same freedom from constraint. Indeed, Coornhert goes beyond the conceptual boundaries of the Renaissance and announces a radically consistent commitment to freedom of conscience that could only dismay his contemporaries.

Impact and Legacy

When Pierre Bayle looked back to the Renaissance from his vantage point in the early Enlightenment and surveyed the century in search of candidates for the title of virtuous atheist, he wasn't satisfied with anyone's credentials. Bayle's *Pensées diverses sur la comète* of 1683 proposes the notorious paradox of the virtuous atheist, and his two prime examples are Epicurus in antiquity and Spinoza in the modern era. Both philosophers exemplify the independence of morality from religion, and both put into question the venerable assumption that religion is the foundation of society. Yet there is a lacuna in Bayle's account for the sixteenth century, not for any lack of virtue but rather for a lack of bona fide atheists. He reports the accusations of atheism against Michel de L'Hospital, which may have been due to the latter's defense of religious tolerance, but Bayle has no doubt that L'Hospital was a good Christian (Bayle 2007, 366). In other words, Bayle tends to confirm the suspicion that Renaissance atheism was largely a phantom in the history of philosophy. If the scourge of atheism was so ubiquitous in

Renaissance polemics, it could not have been as a philosophical thesis but rather as a social affliction, a sort of dehumanization resulting from the proliferation of religious orthodoxies in an age of intolerance.

Atomism in the Renaissance

Christoph Lüthy

Center for the History of Philosophy and Science,
Radboud University, Nijmegen, The Netherlands

Abstract

Strictly speaking, there was no such thing as “Renaissance atomism.” Although an ever-increasing number of philosophers in the period 1400–1650 came to invoke atoms, corpuscles, particles, minima, or other invisibly small structures in their writings, these little entities were never central enough to any philosophical current to warrant defining it under such an exclusive label as “atomism.” The particles that one finds in Renaissance texts on natural philosophy, metaphysics, alchemy, medicine, theology, cosmology, numerology, and other disciplines are moreover defined in so many radically different ways that it is implausible to view them as belonging to the same category. Finally, the reasons why such particles were propagated are similarly disparate. Apart from mathematical, physical, medical, or alchemical reasons, one also finds metaphysical, theological, antiquarian, historiographical, or numerological ones. At any rate, by the beginning of the seventeenth century, the Aristotelian concept of an infinitely divisible matter had come under fire from various sides. By the middle of that century, as a consequence of the writings of authors such as Sébastien Basson, David Gorlaeus, Jean-Chrysostôme Magnen, Etienne Des Claves, and more importantly René Descartes, Pierre Gassendi, Kenelm Digby, and Thomas Hobbes, the Aristotelian principles of matter, form, and privation looked discredited, at least inside and outside universities in Northern and Western Europe. As the microstructure of matter came to assume center stage in the natural philosophical debate, the term “atomism” was introduced for the first time in the 1660s and subsequently depicted as a part of what was hailed as the new “mechanical philosophy.”

Atomism

- [Epicureanism](#)

Introduction

The Greek word “atomos,” which means “uncut” – also in the sense of “uncuttable” – is of ancient origin. By contrast, “atomism” as the name of a philosophical school of thought is a neologism. To be sure, the issues of whether the concept of “atom” is logically sound and whether it possessed any explanatory power were already discussed in Antiquity. But it was only in the second half of the seventeenth century that this concept was taken to be so central as to define an entire school of thought; and only in the nineteenth century did it become prominent.

With Aristotle’s writings as the basis of the arts curriculum at all medieval and Renaissance universities, students all over Europe were invariably introduced to the atom as an erroneous concept. In many of his works, such as *Metaphysics* A4 (esp. 985b4–20), *Physics* IV.6 (esp. 213a28–213b12); *De caelo* I.7 (esp. 275b30–276a18), and *De generatione et corruptione* I.8 (esp. 324a25–326b28) and I.10 (esp. 327a30–328b24), Aristotle discusses and rejected Leucippus’ and Democritus’ suggestion that reality consisted exclusively of void space and of indivisible bits of “being.” In Aristotle’s eyes, the very idea of an “atom” was self-contradictory: how could any extended magnitude be said to resist further division? And how could the numerous phenomena of our physical world be explained on the basis of a limited typology of rigid material particles?

For a variety of reasons, which will be addressed below, the Renaissance and early-modern period witnessed a revival of the “atom” as well as of a number of associated concepts such as “corpuscle,” “particle,” or “minimum.” But it was only in the nineteenth century that historians started to describe this apparent revival in terms of a victory of “atomism” over Aristotelian “hylomorphism.” This bipolar pair of terms says in fact more about the nineteenth-century clash between English, French, and German schools of chemistry and physics and the fiercely discussed “question of the atom” (*Atomenfrage*; Fechner 1864, 4) than it does about intellectual constellations in the Renaissance and the early modern period.

When projected back to earlier centuries, these nineteenth-century historiographical labels are misleading, because they imply that “atom” was a central concept around which entire schools of thought rallied, and by which they defined themselves. For the period before the mid-seventeenth-century anti-atomistic decrees issued by the Jesuit order and by the Vatican Congregations of the Index and of the Inquisition, it is correct to say that “atomism” was “a thoroughly peripheral issue, inasmuch as very little turns on whether one thinks the material realm is or is not infinitely divisible” (Pasnau 2011, 88). For the Renaissance, this bold formulation seems acceptable. Indeed, the nonchalance with which certain sixteenth-century authors engaged atoms in their theories is, from a seventeenth-century perspective, surprising; a good example of a frequent and yet casual usage of an atomistic ontology is the ill-known treatise *De natura libri V* (1573) by the imperial physician Nicolaus Biesius. But the nineteenth-century notion of “atomism” is also misleading for a second reason, for it takes this label to suggest that the concept of “atom” was stable and coherent enough to allow for a “history of atomism” from Democritus through the Renaissance up to our own “atomic age.” This “history” has since the nineteenth century repeatedly been constructed and narrated, but it remains problematic (e.g., Lasswitz 1890; Mabillean 1895; Pullman 1995; Pyle 1997).

This terminology is, then, misleading. As for the term “hylomorphism,” it was coined only at the end of the nineteenth century to describe a certain type of “materialism”; and only in the twentieth century did it come to refer to the Peripatetic theory of matter and form (Manning 2012, 3). The alleged opposite, the term “atomism,” is somewhat older but has an intricate history. The term appears to have been first used in Theodor Gazes’ *Antirrheticon* of ca. 1470, in which the Greek word *atomismós* however means “indivisibility” and figures as the contrary of *merismós* (“divisibility”) (Estienne 1572, s.v.).

After the recovery of Lucretius’ poem and of various Epicurean writings in the fifteenth century, some Renaissance philosophers did indeed come to regard Leucippus, Democritus, Epicurus,

and Lucretius as belonging to the same philosophical school, but until the seventeenth century, it was not because of their use of the term “atom” that they were clustered into a group (in fact, Lucretius never used that term), but rather because of such other traits as their denial of the immortality of the soul and of divine providence, and the system of ethics that accompanied that denial. Very occasionally, the group term “atomist” (*atomista*) is found in late sixteenth-century and early seventeenth-century parlance to refer to a Greek tradition that attributed properties to corporeal, rather than spiritual, entities (e.g., Severinus 1571; Taurellus 1603), but it was only towards the mid-seventeenth century that it began to refer to a “school of thought” (*secta*) to which also modern or contemporary authors adhered. One of the earliest examples of this process is Jean-Chrysostôme Magnen, who in the preface to his *Democritus reviviscens* of 1644 explains that he wishes to revive “the philosophy of the atom,” that “first-born of all schools of philosophy” (*sapientium secta*). In the light of what will be said below, about the heterogeneity of Renaissance and early-modern revivals of atomist thought, it is worth mentioning that Magnen counted Moschus, the legendary Phoenician, and Plato as members of that “school,” but not Epicurus.

As for the abstract noun “atomism” (or “atomicism”), it made its first and ephemeral appearance only in the last quarter of the seventeenth century. But even then, it did not come to mean what we take it to mean nowadays. For Ralph Cudworth, for example, who appears to have coined the term, it designated specifically the perverted, materialist and atheist variant of a true, ancient “corpuscular philosophy” (Cudworth 1678, Chap. 2). Remarkably enough, Cudworth’s compatriot Robert Boyle, too, distinguished between an “atomistic” and a Cartesian-style “corpuscular” philosophy, but unlike Cudworth, he found them to be so similar that they could be subsumed under the umbrella term of “the mechanical philosophy” (Boyle 1661, “Preface”).

Surprisingly, modern historiographers have accepted Boyle’s claim that “the atomical philosophy invented or brought into request by Democritus,

Leucippus, Epicurus, & their contemporaries” was in the seventeenth century “so luckily revived . . . by the learned pens of Gassendus, Magnenus, Descartes, & his disciples” (Boyle 1999–2000, 13: 227). They accepted Boyle’s oft-repeated opinion according to which a number of natural philosophies developed by a range of competing seventeenth-century *novatores* may all be regarded as expressions of an “atomist revival,” which ultimately produced an overarching “mechanical philosophy”—a philosophy that is taken to stand at the cradle of modern science (e.g., Boas Hall 1952; Westfall 1977).

Note, however, that Boyle’s regrouping and labeling of philosophical constellations has had more success in twentieth-century historiography than in its own day. After all, the late seventeenth century achieved no terminological consensus over how to demarcate the labels “atomist,” “corpuscular,” and “mechanistic,” not to mention other terms that are now entirely forgotten, such as “somatistic.” In the eighteenth century, the term “atomism” was seldom used. It was only in the abovementioned context of nineteenth-century controversies over the explanatory value of atoms in chemistry and physics that the term “atomism” was introduced into the scientific jargon. Authors favorable to the notion of “atom” began to spread the idea that there was a coherent history of atomism to be told, from the Greeks through the Renaissance up to the chemical atoms postulated after such pioneers as William Hyde Wollaston and John Dalton.

In order to avoid this misleading anachronism, the term “atomism” will therefore be avoided in this voice. The focus will entirely lie on the vastly different reasons that led Renaissance philosophers, physicians, alchemists, humanists, and theologians to suggest the existence of small and potentially indivisible material entities.

The Philosophical Heritage and Its Renaissance Development

Before the massive introduction of Aristotle’s philosophy in the twelfth and early thirteen centuries, atomistic conceptions of matter had met with some favor. In the twelfth century, for

example, William of Conches stated in his *Dialogue on Philosophy* (I, 6) that “when the Epicureans said that the earth consists of atoms, they were correct.” By contrast, he rejected the Epicurean cosmogonies as a “fable” that was incompatible with Christian faith and revelation. This combination of an atomistic conception of matter with an insistence on divine creation in time would, however, disappear under the influence of Aristotle (Robert 2011, 123).

With the foundation of the university system, from ca. 1200 onwards, Aristotle’s philosophy came to dominate European higher education. As a consequence, Aristotle’s view that all extended magnitudes – matter, time, space, and motion – were continuous by nature and could be divided indefinitely became dominant in natural philosophy and metaphysics for centuries to come. It is however important to understand that Aristotle’s objections were not exclusively aimed at a specific type of matter theory, but applied to all extended magnitudes. For Aristotle as much as for all of his later detractors, to postulate material atoms necessarily also meant to postulate indivisibles of space and time. This underlying assumption of isomorphism survived intact into the seventeenth century (Palmerino 2011). Even Jean-Chrysostôme Magnen, who with his *Democritus reviviscens* strove to replace Aristotle’s matter theory by Democritus’, insisted that “motion, time and space are analogous, that is to say, proportional” (Magnen 1646, 226).

This isomorphism is powerfully visible in those ninth- to twelfth-century Muslim theologians of the *kalâm* (the so-called *mutakallimûn*), who emphatically embraced an overall atomistic conception of time, space, and matter (Dhanani 1994). Their view implied what we would nowadays characterize under the terms “determinism” and “occasionalism,” as in their model, God was said to re-create the world in each instant, with all secondary causality apparently gone – a view that is obviously quite distant from the doctrines of either Democritus or Epicurus. Reports of their convictions entered the Latin West through Avicenna, Averroes, and Maimonides, and were discussed by medieval and Renaissance authors, although until the early seventeenth century, this

radically discontinuist view of the world, in which God is the only active cause, found no supporters. Sébastien Basson may have been the first author to applaud it overtly, although only *en passant* (Basson 1621, 247/227).

Scholarly acquaintance with Aristotle’s arguments against atoms led in the later Middle Ages to questions that were not theological, as the *mutakallimûn*’s had been, but natural philosophical or logical. Philosophers in the fourteenth century were, for example, obsessed by the question of mixture: what happens to the qualities of the elements when they blend into a new, continuous mixture, which according to Aristotle had once again to be a continuum? How did the original ingredients bring about the new “form of the mixt” (*forma mixti*), and how was it possible that sometimes, the original elements could be recovered from the mixt (Maier 1943)? While these questions remained unresolved in the context of the university disputations, they were of concrete relevance to medieval alchemists, whose understanding of mixture and other chemical processes often relied on the assumptions that the ultimate carriers of qualities were individual units. From the anonymous thirteenth-century pseudo-Geber (Paul of Taranto), who in his *Summa perfectionis* spoke of the combination of elementary *minimae partes* that together form a *fortis compositio*, there has existed a continuous alchemical tradition that explained chemical operations such as sublimation or mixture in terms of particles. A particularly strong empirical argument in favor of an atomical structure of compounds was constituted by the operation called *reductio ad pristinum statum*, in which the original ingredients of a mixture were fully recovered from the mixt (Newman 1991, 1996, 2006).

Another set of scholastic authors, beginning with the fourteenth-century Oxford philosopher Henry of Harclay, challenged Aristotle’s concept of the continuum and insisted that it was possible to construct a continuum from a finite (according to some) or infinite number (according to others) of indivisibles. These positions responded to problems that arose from Aristotle’s view of continuous magnitudes and had once again nothing to do with any sympathy for the doctrines of

Democritus or Epicurus (Murdoch 1974; Pabst 1994; Robert 2011). In accordance to the principle of isomorphism, mentioned earlier, the debate between indivisibilists and continuists was about the nature of extensions of all sorts, and involved above all geometrical arguments. A popular anti-divisibilist argument, which had already been used by Arabic philosophers, pointed out that according to the divisibilists, the diagonal of a square would no longer be incommensurable with its sides, but could be shown to be composed of precise number of points, each corresponding to a point on the sides (Murdoch 1969; Robert 2011). This argument remained a powerful weapon through the centuries, even into the seventeenth century, where we still find it extensively rehearsed in Libert Froidmont's *Labyrinthus sive de compositione continui* (Fromondus 1631). It is surprising to the modern reader to see that most divisibilists felt that they had to accommodate their theories to this objection. Sébastien Basson, for example, simply accepted that diagonals were in reality not lines, but steps (Basson 1621, 420). Much more thorough and systematic was the response by Giordano Bruno, who elaborated a veritable geometry of indivisible globules, which explicitly excluded the possibility of diagonal lines. This approach to mathematics, which Bruno shared with Francesco Patrizi, has at times been described as a "realist obstacle" to an understanding of geometrical magnitudes (Védrine 1976). In the seventeenth century, several authors tried – in the wake of Andreas Libavius (1606) and Daniel Sennert (1629) – to overcome this difficulty by distinguishing between the mathematical divisibility *ad infinitum* of all extended magnitudes and the physical indivisibility of material particles.

The growing late Renaissance interest in material indivisibles also has some late medieval antecedents. A small but prominent handful of fourteenth- and fifteenth-century philosophers, less interested in mathematical indivisibles than in physical issues, had put atoms to work in explaining generation and corruption or condensation and rarefaction. One of the most prominent representatives of this physicalist approach was Nicholas of Autrecourt (Grellard 2009). Their

suggestions did however not fall on fertile ground, not least because several of these authors were condemned for holding heretical views, including Nicholas of Autrecourt himself, in 1346. John Wyclif, several of whose views were condemned in 1377 and 1382, is another notorious case in this respect. For Wyclif, space consists of a number of spatial points determined from eternity, and time consists of the same number of moments. All geometrical figures are made up of such points, but since these points are identical to the bodies that fill them, possible space and the actual physical world coincide, in the same way as for God, reality and possibility correspond (Robson 1961).

One of the primary reasons for why such proposals were suppressed was that, well into the modern age, the Catholic Church considered any such atomistic conception to be incompatible with its own dogmatic understanding of the Eucharist in terms of the distinction between substance and accident. Wyclif's condemnation for his alternative to the standard Eucharistic explanation in terms of transubstantiation was thus routinely depicted by Church authorities as a first episode in a perennial opposition between a Christian and a pagan natural philosophy – a perceived opposition that was to get René Descartes' works included in the Index of Forbidden Books as late as 1663.

We find an equally unorthodox blend of theological, logical, and physical doctrines with atomistic implications in the works of Cardinal Cusanus (Nicholas of Cusa), who however not only avoided all censorship, but enjoyed an untarnished reputation. In several of his writings, Cusanus took recourse to mathematical arguments to strengthen his theological and metaphysical reasoning. In his *De docta ignorantia* (1440), Cusanus develops his well-known doctrine of the "coincidence of opposites" (*coincidentia oppositorum*). According to him, in the field of geometry, the largest and the smallest may be shown to coincide formally, as the infinitely small point and the infinite large circle share a number of features. By the same token, in the field of metaphysics, God as the all-embracing measure of all things, and its contrary, the invisibly small unit-point, coincide in various formal

respects. In his *De ludo globi* (ca. 1462), Cusanus furthermore describes the geometrical point as a dynamic starting point, which is capable of “evolving itself” into atom, line and body, and which can therefore be present in all things (Cusanus 1998, 578). The unfolding of the point into the All, and its opposite, namely the contraction of the divine All into a point (which is everywhere and anywhere), are routinely illustrated in geometrical terms.

One of the clearest testimonies to Cusanus’ intellectual influence is constituted by Giordano Bruno, who repeatedly expressed his admiration for the “divine Cusanus” and developed the latter’s doctrine of the “coincidence of opposites” into a complex theory of the “triple minimum” (Bruno 1591). The word “triple” refers to the fact that Bruno’s “minimum” refers to the mathematical point, the mental or spiritual monad, and the physical atom. As for the physical atom, Bruno regarded it (in Cusanian fashion) as the dynamically expansive and ubiquitous minimum in an infinite universe. It is no coincidence that the atom, which for Bruno is always spherical (since it is the projection of the mathematical point into the third dimension), has the same shape as stars and solar systems (*mondi*), so that the “minimum is visible again in large things and the largest” (Bruno 1591, 49). The dynamic expansion of the geometrical points into physical atoms, from atoms into solar systems (*mondi*, in the Italian dialogues) and from the *mondi* into the infinite universe: this is, in Bruno’s mind, the path that the original *centra* take through a series of ever larger *circuli* until they reach the ultimate *circumferentia*. This ultimate, infinite and divine circumference has such a stretched-out curvature that it coincides with the straight line, its logical opposite. And when, in the opposite movement, the ultimate expansion contracts down to the level of the original unit of expansion, the indivisible point, all geometrical opposites fall together once more into a point that is also the smallest line and tiniest body.

Giordano Bruno tried to visualize this doctrine in numerous woodcuts of his own making, some of which are clearly inspired by Cusanus’ diagrams (Lüthy 2010). Several of these woodcuts

Atomism in the Renaissance, Fig. 1 Giordano Bruno’s “Area Democriti” might be the earliest visual representation of atoms ever published. It was crafted by Bruno himself and shows how a cluster of seven atoms produces once again a circular form. Bruno placed stars in the corners of his woodcut to remind the reader or beholder of the fact that atomic and cosmological patterns mirror each other. The image, which was to influence Kepler’s reflections on the hexagonal shape of snow flakes, is contained in Giordano Bruno, *De triplici minimo et mensura* (Frankfurt, 1591, 50)

carry names. A key illustration, and one that probably constitutes the very first image of a constellation of physical atoms, is called “Area Democriti” (Bruno 1591, 51), and it is contained in *De triplici minimo et mensura*, a didactic poem that imitates the style of Lucretius’ *De rerum natura* (Fig. 1). Here, then, we finally encounter an acknowledged debt to Democritus (who, like Bruno, had postulated infinite worlds) as well as to Lucretius (whose preferred word for “atom,” *semina rerum*, Bruno took as a sign of Lucretius’ vitalistic understanding of these particles). And yet, it would be wrong to view Bruno simply as a neo-atomist. “The atoms and the void don’t suffice us” (Bruno 1591, 10), Bruno explained, who filled the cosmos with a vivifying ether.

In fact, no single allegedly “atomistic” author of the early modern period felt that “atoms and the void” were sufficient. None, to begin with, wished to exclude a divine creator. Furthermore,

Renaissance and early modern atoms were routinely endowed with souls, innate forces, sympathies and antipathies, and appetites, or else they were vivified by an ether or guided by God. Aggregate titles such as Nicolaus Hill's *De philosophia epicurea, democritica, theophrastica, proposita simpliciter, non edocta* (1601) or Walter Charleton's later *Physiologia Epicuro-Gassendo-Charletoniana: or a Fabric of Science Natural, upon the Hypothesis of Atoms* (1654) are indicative of the combinatorial and syncretistic nature of the alleged revival of ancient atomist ideas.

The resulting combinations of matter theories were as different and mutually incompatible as the types of particles that each of them proposed. To recognize this incompatibility, it is enough to compare Giordano Bruno's ensouled spherical monads with Pierre Gassendi's or Giovanni Alfonso Borelli's highly complex corpuscular shapes, the unextended point-atoms (*atomi non quanti*) of the later Galileo Galilei, Daniel Sennert's atoms which were carriers of substantial forms, or with René Descartes curiously shaped chunks of *res extensa*. The properties ascribed to the minimal material bodies in each of these models are mutually irreconcilable and furthermore look entirely different when drawn on paper, if they can be drawn at all. In fact, the term "atom" was used in so many different ways that we must conclude that this term had neither a fixed reference nor a stable meaning (to use Gottlob Frege's useful terms).

If we return once more to the first visual representation of atoms, we may say that Giordano Bruno's atomistic speculations combine Cusanus' theologico-geometrical reasoning, Pythagorean monadological and numerological ideas, Lullian combinatorics, Ficinian Neoplatonism, and Copernicus' heliocentrism with Lucretian ideas. As for Bruno's belief in a structural similarity between clusters of ensouled spherical atoms and solar systems, we may say that it had little influence on later thinkers. By contrast, his geometrical reflections on the ways in which spherical atoms can be stacked had, thanks to Kepler's reflections on the hexagonal shapes of snowflakes (Kepler 1611), an important influence on

seventeenth-century modeling in crystallography and optics (Lüthy 2003).

Reasons for the Popularity of Atoms, Particles, Minima in the Renaissance

In the period between 1400 and 1650, which spans the period between the birth of Nicholas of Cusa and the death of Descartes, we find a slow but evident increase in the reliance on all sorts of atoms, particles, minima, and corpuscles for the explanation of natural phenomena. As has been mentioned before, there was no overall program behind this proliferation of small particles, nor can any coherence be discerned between the mathematical, metaphysical, numerological, theological, alchemical, and physical arguments that were produced in their favor. However, what most of these entities had in common was that they possessed a certain ontological stability, which was employed to explain upper-level phenomena. But besides that, they shared no other common properties. Some were described as purely material bodies, others as animated entities; some were said to be simple (such as Bruno's globules), but most others possessed complex structures, having hooks and eyes, protrusions and pores; sometimes they were said to be made up of one universal matter, but sometimes, they were distinguished according to different elements or substances. Nor was there any agreement about how many types of them existed, nor how they interacted with other atoms or with the higher levels of material organization. While for a range of authors from Isaac Beeckman over Sébastien Basson to Pierre Gassendi, atoms gathered to form higher-order molecules, which possessed what we would nowadays call "emergent properties" (such as being the carriers of live-giving seeds), for René Descartes, all physical and chemical properties could be directly reduced to the ultimate level of the corpuscles (see Joy 1987, Chap. 5).

Among the various reasons for the increasing popularity of microscopic particles, the following should certainly be mentioned: the increased attention given to book IV of Aristotle's *Meteorology*, which led to the paradoxical phenomenon

of an “Aristotelian atomism”; the recovery of ancient sources, most importantly of Plato’s *Timaeus*, Diogenes Laërtius’ doxographical work and of Lucretius’ *De rerum natura*; the assumption of a *prisca sapientia*, and the increased attention this assumption demanded for Presocratic philosophy, which was sometimes even taken to include the biblical book of Genesis, Moses, and the legendary Phoenician Moschus, with whom Moses was sometimes conflated; the revival of monadological and numerological theories; alchemical theories; and, from about 1620 onwards, the development of microscopy and the feverish hope for ocular inspection of the ultimate material particles. Although several influences were usually present in any given author or text, they remained distinct enough to lead to an overall conceptual “incoherence.” They therefore also deserve each a separate treatment.

As for the phenomenon of “Aristotelian atomism,” it has to do with the attention that was paid by Italian natural philosophers to book IV of the *Meteorology*. In that work, Aristotle seems to abandon his usual four-element theory, for he mentions only two elements, namely earth (as the principle of dryness) and water (as the principle of wetness), which mix under the influence of celestial heat. “All recognizable substances in our world contain these two elements,” Aristotle states there, “and are to be assigned to one or the other according to the proportion in which they contain earth or water” (*Meteorology* 328a5, transl. Düring 1943, 41). In the same work, Aristotle also offers various physical explanations in terms of particles passing through the pores of bodies, as when he speaks of the “water-particles” slipping through the “pores” of earthen bodies (*Meteorology* 386a18ff). To Renaissance commentators, it seemed that Aristotle had here abandoned his earlier enmity to the concept of atoms. Pietro Pomponazzi phrased this impression strongly when he stated that in this treatise, “Aristotle therefore Democratizes” (*ergo Aristoteles Democratizat*; Pomponazzi 1563, 43v).

From the late fifteenth century onwards, the *Meteorology* and particularly book IV attracted much attention in Northern Italy. Many

commentaries sided with Alexander of Aphrodisias in stating that book IV was in reality an independent treatise on perfect mixtures; Agostino Nifo called this work *Liber de mixtis*, Pietro Pomponazzi *Liber de mixtione* (Martin 2011).

This attention to book IV had a number of interesting effects. Within the Aristotelian university tradition, it led to the emergence of what might indeed be termed an “Aristotelian atomism.” Francesco Patrizi mentions a disputation in which a professor confused his opponent by citing passages from “the so-called fourth book of *Meteorology*,” deriving anti-Aristotelian conclusions from it (Patrizi 1571, 113v). The intense discussion of the implications of *Meteorology* IV led to a revival of explanations of mixture in which the “minimal parts” of elements were said to move until they touched, but did not merge and instead merely exchanged their qualities so as to form a common “temperament” – an explanation that – at least according to Alessandro Achillini, Pietro Pomponazzi, or Agostino Nifo – managed to reconcile Aristotle’s theory of mixture with Galen’s (see Piccolomini 1600, 2: 98r–112v; Martin 2011). It deserves mention here, that similar notions and almost identical definitions of mixture are already found in medieval physiological treatises, for example, in Bartholomew of Salerno (Jacquart 2001).

Outside of the university context, *Meteorology* IV eventually led to explicitly anti-Aristotelian theories. The Padua-trained philosopher-physician Girolamo Cardano developed the two-element theory of *Meteorology* IV into a veritable cosmology. He defined elements as those bodies that could enter into mixtures and form more complex bodies. This definition excluded fire, which Cardano banned from the list of elements altogether, while he considered air to be a real substance, but not an element, as it could not mix with the real elements. The function of air was instead to carry celestial heat down to the terrestrial realm (Ingegno 1980).

Julius Caesar Scaliger, who attacked Cardano’s theory in his idiosyncratic but highly influential *Exercitationum exotericarum liber XV. de subtilitate* (1557), was like Cardano a physician-

natural philosopher trained in Northern Italy. In his rebuttal, he proposed a definition of mixture that was to become famous: “Mixture is the movement of minimal bodies towards mutual contact, so that a union occurs,” adding, “For our corpuscles do not touch as Epicurean atoms do, but so that a continuous and single body is produced” (Scaliger 1557, ex. 110). In other words, whereas Epicurean atoms remain merely juxtaposed, Scaliger’s corpuscles touch and thereby bring about a continuous body defined by common properties. Although Scaliger officially rejected atomistic explanations, such *novatores* as Sébastien Basson, David Gorlaeus, and Daniel Sennert in the early 1600s eagerly cited this definition in defense of an atomistic conception of mixture (Subow 1960). The same may be said about Cardano’s two-element theory, which Scaliger combated: it, too, could easily be “atomized,” by defining earth and water as material building blocks that heat up under the influence of celestial warmth. An explicitly atomistic version of Cardano’s two-element theory is in fact found in David Gorlaeus’ *Exercitationes philosophicae* and his *Idea physicae*, both of ca. 1610 (Lüthy 2012, 86–88).

However, the Aristotelian tradition was not the main cause behind the sixteenth century’s increased curiosity in the explanatory possibilities that the postulate of a structured physical micro-level offered. More direct influences are to be sought in the rediscovery of a set of ancient descriptions of atomism, most importantly in Plato’s *Timaeus*, Lucretius’ *De rerum natura*, and Diogenes Laërtius’ *Lives of Eminent Philosophers* as well as in some other genuine or pseudonymous works.

Some fragments of Diogenes Laërtius’ doxographical account of the views of ancient philosophers had been known before Ambrose Traversari translated its ten books between 1422 and 1433 into Latin, but it was this translation and its subsequent publication that started the wide fifteenth-century diffusion of this text (Dorandi 2013, 10). Diogenes’ doxography includes entries on Leucippus, Democritus, and Epicurus. On the first two philosophers, Diogenes adds much to what is said by Aristotle, who remains otherwise our main source. Notably, it depicts Democritus of

Abdera as a sage who had extensively traveled to the Orient, had been bestowed with many honors, had written 70 works on a great variety of themes, and had died, almost a saint, at age 109. Diogenes furthermore dedicates the last of the ten books of his *Lives* to Epicurus, whose doctrines had previously been known chiefly through Cicero’s even-handed discussion as well as the invectives hurled at him by Lactantius and other Church Fathers. Diogenes Laërtius, who seems to have felt philosophically close to Epicurus, not only described the latter’s life but also reproduced three long letters that he attributes to Epicurus and which he takes to explain his doctrines. These three letters cast a new light on this Greek philosopher, whom early Christian authors had accused of offering an ethics worthy of a swine. It is no coincidence that it was from this tenth book of Diogenes Laërtius’ *Vitae* that Pierre Gassendi would start his grandiose project of reconstructing Epicurus’ philosophy (Gassendi 1649).

A decidedly more important but usually underestimated source of Renaissance and early modern atomistic thought was Plato’s *Timaeus*. This dialogue had exercised a certain influence throughout the Middle Ages, but the concluding parts, in which Plato’s atomist ideas are presented, became only available after Marsilio Ficino translated and published the entire dialogue (1484) and also supplied a commentary, the *Compendium in Timaeum* (1496). Readers encountered in the extensive last part of this late work of Plato’s a theory that explained the formation of all four elements out of triangles of “space” (*chora*), with each element being made up of a certain number of triangles and defined by a regular atomic shape (the so-called Platonic solids). These shapes were taken to explain the sensory elemental properties (named “secondary qualities” after John Locke). To cite the most convincing example, fire particles burn our skin or produce a sharp taste on our tongue when we eat “hot” foods because they have a sharp, pyramidal shape, which can pierce or lacerate other surfaces. Particularly influential about this account was that it also attempted to explain a range of physiological processes by means of the interaction between our bodily machine and these particles.

Plato had since Antiquity been frequently depicted as a more Christian philosopher than Aristotle; and the first part of the *Timaeus*, in which the demiurge constructs the world, had been known since the early Middle Ages. If atomic notions needed a respectable face, then it could be found there. Still, the impact of the *Timaeus* on the evolution of matter theory is complex. On the one hand, his pyramidal fire particle is frequently found even in otherwise nonatomic theories, such as Julius Caesar Scaliger's *Exercitationes exotericae* (1557). In Galileo Galilei's *Saggiatore* (1623), to give another example, one encounters several Timaeian concepts, including the notion of the divine mathematician, who has defined all bodies geometrically, and the distinction between the true geometrical quality of the ultimate bodies and the merely sensory, secondary qualities these provoke in us. Finally, a whole range of early modern physicians – including those who would call themselves “iatromechanics” – came to take Plato's *Timaeus* as a model for how to explain physiological processes mechanically.

Lucretius' *De rerum natura*, rediscovered by Poggio Bracciolini in an unknown monastery close to Lake Constance in 1417 is the third important text that must be mentioned here. Next to Plato's *Timaeus*, this was the most extensive ancient source in which atoms played a crucial explanatory role. It is of course correct to say that Lucretius' text had never been completely lost, and that in the earlier Middle Ages, it had been copied, used, and cited. In the twelfth century, for example, William of Conches quoted Lucretian verses in his *Dragmaticon philosophiae* (Robert 2011). Still, it is obvious that for Bracciolini and his contemporaries, Lucretius' didactic poem came as a surprise. The work, brought to Italy, first spread in manuscript form, and then more rapidly and widely after its *editio princeps* of 1473, going through at least 79 editions by 1625. It was a text that was much appreciated for its poetic elegance, and at the same time dreaded for its impious character. In fact, the Roman Inquisition made sure that no translation into the vulgar was published (Gordon 1962). Marsilio Ficino, who may have been the first Renaissance

philosopher to compose a commentary on *De rerum natura*, later claimed to have burnt it. The earliest published reactions to it, Raphael Francus' *Paraphrasis cum appendice de anima immortalitate* (1504) and Giovanni Battista Pio's *In Carum Lucretium poetam commentarii* (1511), both published in Bologna, clearly indicate that initial philosophical engagement with this work took place the framework of the heated contemporary debates over the possibility of proving the immortality of the soul on philosophical grounds. It was thus initially Lucretius' materialism (which contradicted divine providence, creation, the immortal soul, and other central elements of Christian faith) that attracted attention, but not his specific theories concerning the ultimate building blocks of matter (Prosperi 2004; Nicoli 2017).

In the course of the sixteenth century, however, we see references to Lucretian matter theory increase, and not just among the so-called Lucretian *imitatores*. Interestingly, physicians seem to have been particularly interested in his theory – in fact, we encounter atoms in the sixteenth century above all in medical works. Even though Lucretius invoked “the sacred doctrine of Democritus” and extensively praised Epicurus as his philosophical teacher, his own atomism reflected also Roman medical theories. It has been suggested that his particular interest in an atomistic explanation of diseases may have been due to his acquaintance with the physician Asclepiades of Bithynia (Stückelberger 1972). Irrespective of Lucretius' own beliefs, his total avoidance of the term “atom” and his preference for the expression “seeds of things” (*semina rerum*) was interpreted by many of his readers as evidence that Lucretius' atoms were animated, dynamic units (Gemelli 1996; Hirai 2005). Such a “biological” understanding of Lucretius' atoms is found already in the sixteenth-century physician Girolamo Fracastoro, who in his *De sympathia et antipathia rerum* (1545) explained various physical and medical effects through “effluvia of atoms,” up to the seventeenth-century physician Nathaniel Highmore, who spoke of specific “seminal Atomes” (Clericuzio 2000, 89).

The notion that an atomistic conception of matter was more suitable to medicine than an

Aristotelian one could also derive support from a body of pseudo-Hippocratic letters, which Rinuccio Aretino had translated in the mid-fifteenth century. It contains a number of letters that narrate how Hippocrates has been called to Abdera to heal Democritus, who has apparently become insane, and who has removed himself to the forest, where he is busy cutting up animals. When Hippocrates visits his alleged patient, it turns out that Democritus is engaged in an exercise in comparative anatomy. In his desire to understand why his fellow-Abderites spend their lives in futile endeavors, he is trying to locate the physiological origin of black bile. After that initial meeting, Hippocrates, understanding that Democritus is a more advanced physician than himself, exchanges a number of letters from which he learns further medical secrets from his new master. This body of letters was in many quarters taken as a sign that Democritus' theory of matter was more compatible with medical doctrine than Aristotle's or even Galen's. The most striking product of this tale is Marco Aurelio Severino's *Zootomia democritea* of 1645, which depicts the encounter of Hippocrates and Democritus on the frontispiece, advocates a new method of comparative anatomy, and even interprets the term "anatomy" as "an-atomy" (which Severino took to mean "cutting up down to the level of atoms") (Lüthy 2000).

An altogether different factor that helped Democritus' matter theory in its reemergence after the many centuries of Peripatetic refutation was the emerging Renaissance belief in the existence of a primordial *prisca philosophia* or *prisca sapientia*, which had allegedly sprung up in the temporal vicinity of the divine breath of creation. This belief obviously reversed the time axis to the detriment of Aristotle's authority. No longer the victorious systematizer of rudimentary Presocratic intuitions, he could now be seen as a distant afterglow of original philosophical splendor. The improving textual base appeared to support such a view, because a comparison between Aristotle's judgment of his predecessors and their rediscovered actual or presumed doctrines encouraged humanist historiographers to charge the philosopher with deliberately misrepresenting

the views he reported, an accusation that seems to have first been formulated in 1520 by Francesco Pico della Mirandola. Although Democritus was not the main beneficiary of this reversal of fate – *pace* Ernst Cassirer (1995, 1: 166) – the perceived overlap between his theory of matter and that expounded in Plato's *Timaeus* suggested that an atomistic conception not only predated Aristotle (which had always been clear), but that it was in some sense a venerable *opinio communis*. In this vein, Francesco Patrizi could report that Democritus was generally regarded as the inventor of physics (Patrizi 1581, 3: 293). More extremely, in 1621, Sébastien Basson depicted Aristotle as a solitary rebel against a holy ancient consensus, which involved the *prisca philosophi*, Plato, Hippocrates, Democritus, and Empedocles (Basson 1621, Introduction). In the late sixteenth century, the figure of "Mo[s]chus, the Phoenician" – the true inventor of atomism according to Strabo, who in turn had taken it from Posidonius – was furthermore identified by some with the biblical Moses. This implausible idea, which never became mainstream, represented the culmination of a veritable sacralization of an atomistic matter theory and in some quarters was integrated into what was proposed as a Mosaic physics – a physics that took its cue no longer from Aristotle but from *Genesis* (Sailor 1964; Walker 1972; Blair 2000).

Another version of this quest for primeval wisdom implied numerology, which could assume a range of Pythagorean, Cabbalistic, and Neoplatonic overtones. As mentioned earlier, Giordano Bruno's own type of atomism was partially indebted to this tradition (Yates 1964). Combinations of Pythagoreanism and a monadic conceptions of reality continued, however, well into the eighteenth century, receiving an additional boost by Gottfried Wilhelm Leibniz (Neumann 2013).

Empirical Arguments for the Existence of Atoms

Most of the arguments in favor of the existence of atoms or otherwise stable corpuscles or minima

discussed up to now have been of speculative or “purely philosophical” nature. However, in the later Renaissance, and possibly beginning with Fracastoro’s above-mentioned *De sympathia et antipathia rerum* (1545), empirical arguments became ever more prominent. However, it has been argued that “in atomism, there was no experimental proof possible, although most corpuscular theories of the seventeenth century explicitly claimed to be based upon experience” (Meinel 1988, 68). Those who thought that dust motes or water vapors were atoms, which were thus accessible to ocular inspection, were sorely disappointed by Jean-Chrysostôme Magnen’s calculation that an atom of frankincense had to be at least 7.7×10^{19} smaller than a grain of this same substance (Magnen 1646). The empirical proof thus had to be indirect. But none of them was decisive. After all, the magnet could be explained by atomic effluvia – but also in terms of occult sympathies between bodies; epidemics could be explained by seminal particles – but also by corrupt air; condensation and rarefaction could be explained through particles and the void – but Aristotelians had of course for centuries provided nonatomistic explanations of these very same phenomena. One of the best proofs, which was invoked from Paul of Taranto up to Daniel Sennert, was the abovementioned *reductio ad pristinum statum*, a chemical operation in which the original ingredients of a mixture are recovered – for example silver, which had previously been dissolved in nitric acid – and which is indeed hard to reconcile with the Aristotelian theory of mixture (Newman 2006). However, while this specific chemical operation favors an understanding of chemical substances in terms of stable atoms and molecules, most other operations do not; and in fact, the *reductio ad pristinum statum* seemed to many a tedious exception on which no coherent new theory of matter could be built.

Interestingly, it was the microscope that appeared for a few decades to provide the crucial evidence for an atomistic conception of matter. One of Aristotle’s most successful epistemological objections to an atomistic conception of matter had been that if Democritus were correct, then a

person with perfect eyes (such as the mythological Lynceus) would see a very different world than we do, namely a discontinuous, literally “atomized” world (*De generatione et corruptione*, II.10). After the development of microscopes around 1620, it turned out that magnified objects did indeed look different than they did to the naked eye. Although this did not itself prove the existence of atoms, it did invalidate Aristotle’s belief in the adequacy of our senses. The first philosopher to recognize this was Francis Bacon, who was probably also one of the first persons to peer through Cornelis Drebbel’s newly invented compound microscope. When speaking of this instrument in his *Novum organum*, he remarked: “if Democritus had seen [the new microscope], he would have rejoiced a lot, believing a method to have been discovered to see the atoms” (Bacon 1620, aphorism II§39). Although Francis Bacon had a great esteem for Democritus and also postulated material microstructures and schemata, he was however not persuaded by an atomistic explanation of natural phenomena (Rees 1980). Still, his aphorism about rejoicing Democritus was triumphantly handed from one microscopical author to the next. At the height of the hype, Nathaniel Highmore wrote that he had seen Descartes’ magnetic effluvia through a microscope (Highmore 1651, 117), while Henry Power and Robert Hooke were persuaded that a little improvement of optical glasses was going to be sufficient to render atoms visible (Power 1664; Hooke 1665). In the event, they did not, and their credulousness was to become the laughter of the eighteenth century.

After a veritable atomist hype that the Catholic Church and in some minor way also certain Protestant currents tried to impede, the seventeenth century eventually ended with the widespread conviction in much of Europe that Aristotle’s description of bodies in terms of matter and form was unhelpful or outright wrong, and that there were indeed material structures to be found beneath the visible realm. However, no consensus had been reached about how many structural levels there existed underneath the level of visibility; whether there was an ultimate level to be found; and if so, of how many types of particles

that ultimate level would be constituted, and by what characteristics these types would be defined.

Augustinianism

Alexander Lee

Centre for the Study of the Renaissance,
University of Warwick, Warwick, UK

Abstract

Augustine exerted a pervasive influence on philosophy throughout the Renaissance period, due in large part to a renewed effort to recover the entirety of his *oeuvre* and a recognition of his role as a mediator between classical and Christian culture.

Heritage and Rupture with the Tradition

During the Renaissance period, St. Augustine experienced his own “rebirth” (Oberman 1978, 86). Whereas, for much of the Middle Ages, his works had been known primarily through Peter Lombard’s *Sentences*, Yves of Chartres’ *Decretum*, and *florilegia*, the early decades of the fourteenth century witnessed a new effort to recover the entirety of his corpus, and to acquire a more direct acquaintance with his thought. Exactly where this began is debated. While some have argued that it emerged in the circle of the Oxford Calculators, as part of a reaction against modern “Pelagianism” (Trapp 1956; Oberman 1958), others have suggested that it may instead have arisen out of the Emperor Ludwig IV’s struggle with Pope John XXII (Saak 2012). From the beginning, however, a decisive role was played by members of the Augustinian Order. Of these, the leading light was Gregory of Rimini, who perhaps did more than anyone else to restore long-neglected works to circulation and to expose misattributed works as apocrypha (Leff 1961); but also of note was Bartolomeo da Urbino, whose *Milleloquium Sancti Augustini* contained more than 15,000 quotations from Augustine’s works, arranged under more than a thousand headings.

Among the most avid readers of St. Augustine were the humanists. Seeking out his works

with undisguised enthusiasm from an early date, they soon supplanted the friars as the driving force in the recovery, collation, and emendation of texts. Petrarch not only included four of Augustine’s works on a list of his *libri peculiaries* but also confessed that, of all Catholic writers, Augustine was his favorite (*Fam.* 4.15.3). And while Desiderius Erasmus expressed a preference for St. Jerome, it is to him that posterity owes the first critical edition of Augustine’s *oeuvre*.

Augustine’s influence was consequently felt in almost every area of Renaissance culture – including philosophy (Gill 2005). So great was his reputation as an arbiter of “orthodoxy” that appeals to his authority were commonplace. In seeking to rebut George of Trebizond’s calumny of Plato, for example, Cardinal Bessarion tasked his amanuensis with finding suitable Augustinian *testimonia*, in the belief that the mere mention of the saint’s name would be sufficient to validate his position. But Augustine also provided readers with a model of the Christian philosopher. Keenly aware of how much his writings owed to classical thought, they acknowledged him both as a mediator of antique culture, and as a model of how ancient philosophy could be harnessed to the service of the Christian faith. Thus, in Petrarch’s *Secretum*, “Augustinus” is called upon to speak on Lady Truth’s behalf and, in attempting to guide “Franciscus” away from his sinful ways, frequently quotes from Cicero’s dialogues. So too, Marsilio Ficino declared that, since Augustine had chosen “Plato out of the ranks of the philosophers to be his model, as being closest of all to the Christian truth,” he would take Augustine for his guide in the *Theologia platonica* (pr. 2; q.v. Garin 1940).

This is not to say that Augustine was without his critics. Precisely because he was so ubiquitous a presence, he was a regular target of philosophical attacks. Though Benedetto Morandi thought it “foolhardy and even wicked” to challenge Augustine in matters of faith, for example, he believed that “in matters separate from religion,” the saint’s judgment could, and even should, be questioned (Trinkaus 1970, 1:287). Similarly, Poggio Bracciolini went so far as to suggest that

the pride of man was so great that even “the blessed Augustine” was susceptible to error.

Nor is it to say that Renaissance “Augustinianism” was monolithic (Lee 2012). Augustine himself had been a notoriously unsystematic thinker. The product of a philosophically diverse age, he had written his major works not as constituent components of a coherent body of thought, but in response to changing circumstances. In the course of his struggles with the Manicheans, the Donatists, and the Pelagians, he had frequently had cause to change his mind – so much so, in fact, that in his old age, he had written the *Retractationes* to correct the perceived “errors” of his earlier works. As such, Renaissance readers were able to find in his diverse and heterogeneous corpus support for a wide range of contrasting philosophical perspectives – all with equal legitimacy.

Theories of soul. If there was a common thread running through Renaissance Augustinianism, however, its beginnings lay in a distinctive conception of the human soul (Bouwsma 1975). In contrast to contemporary Aristotelians, who regarded man as a dualistic creature, consisting of a separate body and soul, Augustine’s imitators believed that, because man had been created in God’s “image and likeness” (*Gen.* 1:26), he was necessarily a unity, in which *corpus* and *anima* were inextricably bound together. This was articulated with particular clarity by Aurelio Lippo Brandolini. In his *Paradoxa christiana*, Brandolini noted that, while God had created man with both spiritual and corporeal natures, He had “joined both parts together in such a way that each needs the other, and neither can carry on its action or live in any way without the other” (Trinkaus 1970, 1:313).

There was, however, one important difference. Whereas the body, being subject to change and decay, occupied the lowest rung in the hierarchy of existence, most of Augustine’s Renaissance readers accepted that the soul, being immortal and changeable only in time, stood halfway between the fragility of the flesh and the unchanging eternity of God. The subject of innumerable treatises, this immortality could be demonstrated in a variety of different ways. While some – taking

their lead from Augustine’s *De immortalitate animae* – stressed that the soul’s immortality was a function of its direct dependence on God, others, inspired more by *De Trinitate* and *De beata vita*, found evidence for it in man’s innate longing for happiness and perpetuity.

This led many of Augustine’s readers to believe that man possessed a special – even unique – dignity. Though the soul’s mid-rank position meant that it was able either to seek its happiness in the body or to turn toward God, the mere fact of its immortality was sufficient to show that it was not only more excellent than all sensible things but also nearer to God even than angels. This was not all. Influenced by Augustine’s most strikingly Neo-Platonic works, some Renaissance philosophers – such as Lorenzo Valla and Francesco Giorgi – even came to argue that the soul was in some sense “divine” and that incarnate man enjoyed a God-like status.

Of course, not all of Augustine’s readers held to such views. On occasions, his emphasis on the unity of the body and soul could even be used to support precisely the opposite conclusions. Although Pietro Pomponazzi could hardly be described as an “Augustinian,” for example, he doubtless had Augustine in mind when he argued that, if body and soul were indeed one, the soul could be neither immortal nor “divine” and that, if any claims were to be made for man’s dignity, they would have to be built on quite different foundations. Among the saint’s more devoted followers, however, such peculiar misappropriations were rare.

As to the soul’s constituent parts, there was much greater agreement. Just as Augustine had argued that the soul reflected the structure of the Trinity, so his Renaissance readers maintained that it consisted of three parts: memory, intellect (or reason), and will. This triad was unquestioningly repeated in Lorenzo Valla’s *Repastinatio dialectice et philosophie*; and, by the early sixteenth century, it enjoyed such wide currency as to appear in both Girolamo Benivieni’s Christian canzoni and Fernán Pérez de Oliva’s *Diálogo de la dignidad del hombre*.

Theories of knowledge. This understanding of the soul’s nature had important implications for

the manner in which Renaissance philosophers approached theories of knowledge. Though it was accepted that perception was undergone by the body, most nevertheless followed Augustine in recognizing that, since body and soul were united, nothing which the body perceived could be hidden from the soul (cf. *De quant. anim.* 48). This being so, there was no need for “representation.” Rather than receiving an “image” of what was perceived from an intermediary faculty (as contemporary Aristotelians supposed), the soul was thought to receive perceptions directly from the body.

Needless to say, few of Augustine’s readers were under any illusions about the reliability of sensory perception. Like him, they were aware that the senses could all too easily be deceived. As such, they were doubtful about the possibility of knowing anything certain about the external world. But, like Augustine, they accepted that something, at least, could be known about the *phenomenal* world. Often elaborated in opposition to skepticism, this view – which was later to have a decisive influence on René Descartes – was expressed in a variety of different ways; but perhaps the most forceful statement was offered by Heinrich Cornelius Agrippa. In *De incertitudine et vanitate scientiarum*, Agrippa argued that, while the senses could neither deliver any certain experience of the world nor disclose anything about the nature and causes of phenomena, the application of reason to our sensory perceptions could nevertheless provide us with *some* understanding of phenomena in themselves.

Nor did Augustine’s readers believe that the limitations of the senses prevented man from knowing something about eternal truths. Given that the soul was immortal, it necessarily contained within it a kernel of God’s transcendental reality. By means of the intellect, and with the assistance of grace, the soul could hence abstract Neo-Platonic “Forms” from the disparate evidence of our sensory perceptions or even intuit immutable truths, such as the laws of mathematics. This could sometimes be expressed in terms of “illumination,” using the same language as Augustine had done in *De magistro*. In his *Theologica*, for example, Tommaso Campanella

observed that it was by the *lumen Dei* which the soul contained within itself, and which comprised the *rationes rerum*, that the intellect was able to apprehend that which was unknown *in rationibus aeternis*. More often, however, it was presented as a form of recollection. Much as in Augustine’s *De Trinitate*, this had an unmistakably Neo-Platonic stamp. Although few – if any – of the saint’s readers would have gone so far as to suggest that the soul could recall any “Forms” with which it had been in communion before its current incarnation, Bernardino Telesio typified the majority’s opinion in arguing that, with God’s help, the soul could “remember” knowledge which it already contained within itself.

Nor, indeed, did Renaissance Augustinians have any doubt about the possibility of self-knowledge. Following Augustine’s argument in *De Trinitate*, many accepted that the soul’s attributes – thinking, willing, and remembering – were self-certifying and that any doubts about sensory experience served to validate an awareness of the self. In Petrarch’s *Secretum*, Augustine’s advice to Franciscus is predicated on the belief – derived from Augustine’s *Soliloquia* – that knowledge of the self and of the soul’s true nature was not only possible, but even necessary. So too, Ficino cited Augustine’s *Contra Academicos* and *De vera religione* as an authority for the same view in the *Theologia platonica*.

Ethics. To an even greater extent than on theories of knowledge, Augustinian conceptions of the soul had a decisive impact on Renaissance ethics. Since the soul occupied a mid-rank position in the hierarchy of creation, the saint’s readers recognized that it could either descend to the level of the body, in which case its existence would be an unhappy one, or turn heavenwards, in which case its reward would be everlasting bliss in the company of God after death. Yet *how* the soul could be rightly oriented remained to be seen. Augustine himself had never settled on a single answer, and his changing views were reflected in the diversity of opinion among Renaissance philosophers.

For some, the intellect was of primary importance. Influenced by a close reading of Augustine’s early works – especially the *Soliloquia* and

De vera religione – Petrarch maintained that, if a man came to a proper understanding of his soul's true nature, he would inevitably will the good – and thus merit *vera felicitas* in the next life (Lee 2012, 63–112). Similarly, Benedetto Morandi, for all his doubts about Augustine, accepted the saint's youthful belief that, by the “force of the intellect,” man could truly make himself happy (Trinkaus 1970, 1:284).

For others, virtue was more a matter of will – although opinion was divided over whether it was free or not. Relying on Augustine's *De libero arbitrio* and other similar works, Aurelio Lippo Brandolini and Giovanni Nesi maintained that the will not only directed the intellect but was also solely responsible for the proper ordering of the soul. Quite different, however, were the views of Coluccio Salutati, Lorenzo Valla, and – later – Martin Luther. Drawing on Augustine's anti-Pelagian writings, they argued that, while the soul could, in a certain sense, be called “free,” man was nevertheless wholly dependent upon God for his salvation. If we will the good, they believed, we do so only by cooperating with the action of grace.

To this latter view, there was a further implication – again derived from Augustine's most mature works. Since God is omnipotent, omniscient, and endowed with perfect foreknowledge, it was recognized that He not only knows in advance who is good and who is wicked but actually predestines some to Heaven and others to Hell. As such, it was possible for Augustine's readers to speak of humanity being divided between two groups: the “City of God” (those who loved God and who were destined for salvation) and the “city of man” (those who loved the self and who were doomed to perdition). Yet there was some disagreement about whether membership of either group could be known in this life. Following Augustine's most thorough treatments of the subject, some – such as Luther and Melancthon – believed that membership was known only to God and that any given human society hence contained a mixture of both. But others – such as Jean Calvin – maintained a contrary view. Seizing on passages in which Augustine appears to identify the “City of God” with the Church, Calvin used the doctrine of the “two

cities” as the basis for notions of an “elect people,” identifiable either with a confessional group or with a subgroup thereof.

Political philosophy. Augustine's ethics had far-reaching consequences for Renaissance political philosophy – although, as in other fields, the ambiguity of his works was reflected in a diversity of opinion among his readers.

Those, like Calvin, who saw the “City of God” reflected in earthly societies were led to a view of politics which, though different to Augustine's position in *De civitate Dei*, had parallels with his writings on the Donatist controversy. Under this interpretation, the ends of the political community were, in many senses, identical to those of the Church. As such, it followed that secular government should not only cooperate with the religious authorities but should also act in such a way as to maintain, or even enforce, virtuous living.

Those who believed that the two cities remained invisible, by contrast, were led to a very different vision of political authority. Derived principally from *De civitate Dei*, this often began from a rejection of Ciceronian conceptions of *societas*. Given that any group of people will contain members of the “City of God” and the “city of man,” Augustine had pointed out that a society clearly could not exist on the basis of a shared sense of right and the common good, as Cicero had suggested (*Rep.* 1.25.39). At most, a community might be able to agree on certain “goods” – such as peace – which they could either “use” for the sake of pursuing salvation or “enjoy” for their own sake. As such, Augustine had suggested that a society should instead be defined as an assembly of individuals united by an agreement as to the objects of their love (*De civ. Dei* 19.24). It thus followed that, while political authority could, in some circumstances, use law to inculcate a habit of virtue, its principal role should be merely to guarantee the “well-ordered concord of obedience and rule” needed for men to attain these objects (*De civ. Dei* 19.17). The purpose of secular government was hence *not* to make men good Christians, but simply to create the conditions in which the “City of God” could pursue salvation unmolested. As Augustine's Renaissance readers were quick to

recognize, this had particularly clear implications for the relationship between the Holy Roman Empire and the Papacy. In the early *Trecento*, for example, Giovanni da Cermenate used Augustine's understanding of *societas* to demonstrate that, while the emperor was obliged to defend the Church if necessary, his authority was equal to – and separate from – that of the pope. At the same time, it was recognized that this could also be turned on its head and used as the basis for more direct criticisms of the papacy's temporal power. It is even possible that Machiavelli may have had Augustine in mind when reproving the worldliness of the contemporary Church in the *Discorsi*.

Another respect in which Augustine influenced Renaissance political philosophy was in regard to just war theory. His belief that conflict could be justified, provided it aimed at peace, and was waged without cruelty for the sake of furthering the rightful ordering of humankind, lay behind almost all discussions of the topic throughout the period. It is found in Petrarch's letters on the Venetian-Genoese war of 1350–1355 and would later have a decisive impact on the thought of Hugo Grotius.

Philosophy and eloquence. A final area of influence concerns the relationship between philosophy and eloquence. Although Cicero's rhetorical theory predominated throughout the Renaissance period, Augustine's *De doctrina christiana* nevertheless provided some Renaissance readers with a model of how this could be made to serve the cause of Christian truth more fully. Among the most profoundly affected was Petrarch. For all his admiration for Cicero, it was to Augustine that he owed his belief that poetry was the proper medium not only for theology but also for philosophy and that the inculcation of virtue was more important for an orator than an understanding of rhetorical rules (Lee 2012, 277–350). A lesser – but no less noteworthy – debt can be observed in the writings of Salutati and Valla, among others.

Automata, Renaissance

Stefano Gulizia

Bucharest, Newark, NJ, USA

Abstract

Automata and self-moving mechanisms have a long history – part of which, namely the medieval chapter, remains largely unexplored in any systematic fashion – and have articulated not only issues of technology and mechanical explanation of the world but also ideas of foreignness and cunning intelligence, to say nothing of the deep-ranging political significance that these instruments served in Mediterranean diplomacy. If the Industrial Revolution reflected on robots as a threat to human civilization, the Age of the Enlightenment used automata to think about the complex cultural function of bodily motion and performances.

Innovative and Original Aspects

Apart from their status as valued commercial commodities – evident, for instance, in enormously popular attractions such as Wolfgang von Kempelen's chess-playing Turk (1784) or Jacques de Vaucanson's defecating duck (1742) – and long before they served as potential metaphors for social order – at least as early as in Hobbes' influential description of society as an "Artificial Man" in *Leviathan* (1651) or in Descartes' explanation of automatic patterns in sensory data – self-moving mechanisms were able to articulate key issues of their period, particularly ideas about social hierarchy and economics. Any automaton was equipped to work as a spectacular *deus ex machina*, that is, through individualized exhibitions of entertaining wonder (Bynum 1997). At some historical juncture – namely, the Victorian Age – the inner theatricality of the automaton (Cambiano 1994) also acquired the distinction of a sympathy machine or an imaginary prosthetic.

In the Aristotelian tradition, automata were part of a sophisticated argument concerning the self-regulation of embryological development, although these devices can hardly be used as gap-fillers within a mechanistic understanding of natural history (Berryman 2004). At the same time, the idea of stunning wonder-making was never far away, both in its practical consequences – as in the military machines built by Archimedes – and in its crowd-pleasing effects. This explains why Pappus and Hero of Alexandria, two Hellenistic theoreticians whose work would be translated and further expanded in the Renaissance (Marr 2004), present useful knowledge and technical show-business as something epistemically on a par with philosophy (Tybjerg 2003).

In addition, automata represent a mechanical narrative of *metis* or cunning intelligence, which enables the triumph of the weak over the strong (Wolfe 2004) and allows a certain degree of social mobility for artisans. Finally, in a variety of intellectual and literary texts, the nineteenth and twentieth centuries have expressed a tendency to lump together different examples of automaton-making, by using them as universal mechanical metaphors – often as harbingers of the threat posed by the modern industrial age to bodily motion and the human soul more generally.

This kind of teleology, however, should be actively resisted (Kang 2011). Instead, individual automata should be carefully placed within their philosophical and political contexts. To stay briefly with the eighteenth-century fascination for "robots," which shows the Enlightenment's affinity for thinking with metaphors of the machine (Schaffer 1999), some considerable differences remain: first between the objects themselves – including the engineering decisions that made them how they are – and their reception, social, and textual and second among competing representations of their epistemic relevance. One might understand a series of women automata created by Swiss families of craftsmakers like the Jaquet-Droz and the Roentgen to be simulations of live bodies (Riskin 2003), in which case they could primarily be said to provide anatomical and physiological knowledge about humans and animals. Or, conversely, one might take these

automata as replications of cultural and political body practices (Voskuhl 2013), in which case they should be investigated especially as a type of materiality painstakingly designed to perform sentiments and sociability pertaining to domestic and international markets.

Clock-making, moreover, as it was practiced in the Alpine valleys and in Central European locales such as Prague, hints at the vast role that mechanical devices played in early modern Mediterranean diplomacy, where they affected global commerce and the question of sovereignty (Iafrate 2015). To a degree, this function was already visible in the Middle Ages. Medieval accounts of technological wonders, long neglected until recently (Truitt 2015), punctuated the unfolding of geopolitical ceremonial, while also offering a narrative focus of foreignness.

Abstract

Averroes (Ibn Rushd) exerted a profound impact on Renaissance philosophy, primarily, although not exclusively, through his commentaries on Aristotle. Renaissance scholars translated and conducted significant editorial work on his writings, which were frequently printed in the sixteenth century. The commentaries formed the basis for countless philosophical interpretations and disputes, but the most historically prominent were those related to his psychology. Averroes proposed that the material intellect is one in number, a thesis referred to as the unicity of the intellect or monopsychism. In the years around 1500, many, in particularly northern Italian, philosophers found Averroes' interpretation of the soul philosophically convincing, even if they recognized its lack of conformity to Christianity. In the same years, ecclesiastical censures were promulgated that forbade the promotion of the unicity of the intellect. Nevertheless, philosophers continued to rely on his commentaries until the last decades of the sixteenth century. Thus, Averroes had a mixed reputation. While many university professors commended his subtlety as a commentator, humanists criticized his work for its supposed impiety and poor Latin, and many Thomist theologians considered his works a threat to religious orthodoxy.

Background

The writings of Averroes (Ibn Rushd, 1126–1198) had a profound effect on Renaissance philosophy, just as they had on medieval philosophy. Similarly, in the historiography of Renaissance philosophy, the concept Averroism has played a prominent role since the middle of the nineteenth century. Scholars have often seen Averroism as a link from Renaissance philosophy, on one hand, to the debates between philosophers and theologians during the late thirteenth century, and on the other hand, to early modern libertinism, atheism, and modern conceptions of secularism.

Averroes' primary, but not sole, influence during the late Middle Ages and Renaissance was as a commentator on Aristotle. Additionally, his medical treatise, which synthesized mainly Galenic concepts, and circulated under the title *Colliget*, made him an authority for physicians and professors of medicine. The corpus of Averroes' writings is large. He wrote multiple commentaries on nearly all of the Aristotelian corpus. These commentaries vary in size, some being paraphrases; others lengthier, the so-called middle commentaries; and others very detailed, referred to as long commentaries. As such, these commentaries served as effective guides to reading and interpreting Aristotle's works on logic, natural philosophy, cosmology, metaphysics, and psychology, topics which formed much of the core of university curricula by the thirteenth century. Averroes' commentaries were also subject to philosophical investigation. Averroes' commentaries were translated into Latin in the same decades of the thirteenth century that most of the Aristotelian corpus was. Accordingly, they were the first pre-eminent guides to Aristotle in the Latin (Christian) West, in part, as a result of Averroes' dedication to revealing what he believed was Aristotle's intent or "mind" as it was often phrased in his works and in those of his followers.

While the bulk of, if not all, Renaissance scholars were unaware of the historical context of Averroes' intellectual output, nonetheless it is relevant, as it conditioned the hermeneutical approach that, at least for some thinkers, made Averroes' interpretations appealing. Averroes

attacked the philosophical approaches of Avicenna (980–1037), al-Ghazālī (1058–1111), and the Islamic theologians designated *mutakallimūn*, or *loquentes* in the Latin translation, because they, in his view, either illegitimately combined theology and philosophy or attacked philosophy using religious credos. Rather, Averroes sought to distinguish the two fields, seeing philosophy, or *falsafa*, the philosophical tradition that descended from ancient Greece, and rationality in general as largely equivalent to Aristotelian thought and thereby distinct from theology and scripture. In this manner, Averroes, like many other Islamic philosophers, followed the interpretative traditions established in the late antiquity that promoted commentaries as the main genre of philosophy. Unlike many of these ancient commentators, who also wrote on Plato's metaphysics, Averroes professed to have a hostility toward many Platonic ideas, in particular those that involved the application of mathematics to natural philosophy, even if it is possible to identify strands of Platonism in Averroes' thought.

Instead, Averroes promoted the belief that Aristotle was a standard of reason, the realization of the perfection of the human mind that providence supplied to aid humanity's knowledge. As such, his writings provided the unequivocally ideal source for discovering philosophical truths. Accordingly, Averroes advocated a method of interpretation that prized a more literal reading of Aristotle's than is found in those who attempted to reconcile or create grand syntheses of different schools of philosophy. A consequence of this approach is that Averroes' commentaries provide readings that clarify and (internally) reconcile Aristotle's thought, without explicit attempts to synthesize them with other philosophies and theology, like Avicenna or Thomas Aquinas (1225–1274) did; or to use Aristotelian concepts as a foundation or starting point for philosophical speculation that goes beyond what is found in Aristotle's texts, as was the case with the Merton school of calculators that thrived in Oxford during the fourteenth century.

Averroes' desire to expound the views of Aristotle as philosophical truth meant that for several issues, his doctrines did not easily conform to the

theological doctrines of monotheistic religions. Two of the most important positions in this respect were the eternity of the world and the nature of the human soul. First, in contradistinction to a literal reading of the book of Genesis and in line with Aristotle, Averroes contended that the world was not created in time, but was rather eternal, having always existed. Similarly, God did not create living beings, but rather they are generated and participate in eternity through the endless persistence of their respective species. Second, Averroes promoted what was later labeled monopsychism or the unicity of the material intellect. This view holds that the passive or material intellect is shared by all humans. The attractiveness of this theory is that it gives a plausible explanation for unicity of knowledge. Its ramifications, however, include the impossibility of survival of the individual intellect after death, eliminating the plausibility of doctrines of the afterlife that are central to Islam and Christianity. These positions, coupled with his privileging of reason – and not sacred texts – as the ultimate arbiter of truth, rendered Averroes' works controversial in both the Middle Ages and the Renaissance, even if his philosophical solutions and clarifications of Aristotle were widely read and endorsed.

During the thirteenth century in the Latin West, a number of ecclesiastical authorities and theologians rebuked Averroes' teachings, despite, or, perhaps as a result of, the diffusion of his writings in the new universities of Western Europe. Thomas Aquinas was the prominent, if not most outspoken, opponent of Averroes' views on the soul. He wrote the treatise *De unitate intellectus contra Averroistas* (ca. 1270) that sought to demonstrate the lack of coherence of Averroes' positions. Thomas's attacks, or triumph as they were called, were later memorialized in paintings that decorated Dominican churches, such as in Santa Maria Novella in Florence, Santa Maria sopra Minerva in Rome, and Santa Caterina in Pisa (Polzer 1993). Thomas was by no means the only opponent of Averroes. For example, the theologian Giles of Rome (ca. 1245–1316) deemed twelve positions he attributed to Averroes as inimical to Christianity.

A few years after the composition of Thomas's treatise, Étienne Tempier, the bishop of Paris,

included a number of positions linked to Averroes in the famed Condemnations of 1277, which sought to limit what could be taught in the faculty of arts at Paris. The Condemnations of 1277 were likely aimed at Siger of Brabant (ca. 1240–ca. 1282) and Boethius of Dacia (ca. 1240–ca. 1285), who taught, among other doctrines, that Aristotle held the world to be eternal. Siger distinguished between philosophical discourse and revelation, restricting his discussions of the intellect and the eternity of the world to what he referred to as “natural reasons,” which derived from his reading of Aristotle's natural philosophical texts. Significantly, for the history of Averroism, these Condemnations forbade teaching what was called the doctrine of “double truth,” which held that different truths held for the same topic in different fields of inquiry. Thus, a proposition could be true in natural philosophy but false in theology. Numerous scholars and historians have associated the doctrine of “double truth” with Averroes and his followers, even though he did not promote that idea and the endorsement of that idea cannot be found in the writings of Siger, Boethius, or any other philosopher who was influenced by Averroes. “Double truth” is probably more closely linked to the inquisitor's caricature of Averroes and Averroism than any actual position. Nonetheless, because of its prominence in the Condemnations of 1277, it has retained a significant role in the historiography of medieval and Renaissance philosophy (Thijssen 1998; Bianchi 2008). The Condemnations of 1277 had a limited effect, and within a half century its promulgation, if not forgotten, was not nevertheless not universally heeded, as Averroes' writings and ideas spread throughout the universities of Catholic Europe, demonstrated by the examples of John of Jandun (ca. 1280–1328), Thomas Wylton (died ca. 1327), and John Baconthorpe (ca. 1290–ca. 1346). Yet, through the polemics of Thomas and the Condemnations of 1277, Averroes gained a reputation for impiety that persisted throughout the Renaissance and early modern era.

Both medieval and Renaissance understandings of Averroes differ from the interpretations of scholars of the twentieth and twenty-first

century. First of all, they did not, for the most part, seek to understand Averroes as a historical figure. Consequently, they did not trace the development of Averroes' thought. Secondly, until the late fifteenth century, they relied only on Latin translations, meaning they did not have access to his entire corpus. For example, the *Decisive Treatise*, which examined the relation between philosophy and religion, with a few exceptions, was unknown to Renaissance scholars. Other writings, such as his *Commentary on Plato's Republic*, were not widely available in Latin until several decades into the sixteenth century. Furthermore, many medieval and Renaissance scholars, even those attracted to Averroes' ideas, seem to have been almost entirely uninterested in developing knowledge of the history of Islamic philosophy. Thus, their understanding of his life and works was greatly limited in comparison to what is now available, not only in Latin, but also in Arabic and Hebrew. While Renaissance philosophy was conditioned by the medieval Latin tradition, Averroes was also greatly influential in medieval Jewish philosophy, which significantly affected the transmission, translation, and interpretation of his work in the sixteenth century.

Definition and Historiography

During the Renaissance, Averroes' commentaries on almost all the Aristotelian corpus as well as his medical writings were well known, frequently cited, and greatly influential. Yet Averroism, as the term and concept has developed in the historiography of Renaissance philosophy, does not equate to the broad influence of Averroes' thought, but is largely confined to a few specific issues, most importantly his theory of the intellect.

The historiography of Averroism is one of the longest of all of Renaissance philosophy. It reveals shifting ideals of scholarship during the nineteenth and twentieth centuries. The modern origins of scholarship on Averroism began with Ernest Renan's 1852 *Averroës et l'Averroïsme*. This early work of Renan helped initiate a lengthy literary career that included a biography of Jesus, which emphasized his humanity, and an

innovative and influential theory of nationalism. For Renan, the history of Averroism was the history of a misinterpretation of Aristotle that revealed the historical struggles between philosophy and religion (Marebon 2013). Renan, influenced by positivism, saw in Averroism the transmission of what he considered to be an undying spirit of secularism and anticlericalism that persisted throughout the Middle Ages and the Renaissance until it transformed into the materialism of modern science that emerged, in his view, in the seventeenth century. As such, Renan equated Averroism with freedom of thought and resistance to ecclesiastical orthodoxy, a form of philosophical heterodoxy that stemmed mainly from two specific issues, the eternity of matter and unicity of the material intellect (Martin 2007).

Renan's emphasis on these two specific issues, however, did not temper his understanding of Averroism in broader terms of secularism. A number of the thinkers he associated with it, such as Pietro d'Abano (c. 1250–c. 1316), Pietro Pomponazzi (1462–1525), Simone Porzio (1496–1554), Giacomo Zabarella (1533–1589), and Cesare Cremonini (1550–1631), did not endorse Averroes' theory of the intellect. Yet Renan found that their separation of philosophy from theology adhered to the spirit of Averroism. For the Renaissance, Averroism flourished in particular in what Renan called the "school of Padua," which he believed began with Gaetano of Thiene (1387–1465). This movement eventually proliferated in several major intellectual centers in all of northern Italy, until its demise that accompanied Cremonini's death in 1631 (Renan 1852).

Renan laid the foundation for much of the discussion of Renaissance Averroism for more than a century and a half. Scholars looked to figures central to Renan's narrative in order to identify parallels to positivism. The French historian Jacques Charbonnel sought to trace the origins of the irreligious libertinism of seventeenth-century France to Averroes and his sixteenth-century Italian followers (Charbonnel 1919). Erminio Troilo contended that Averroism was an outpouring of a heterodox spirit that naturalized Aristotle by deflating the importance of

metaphysics. For Troilo, this heterodoxy flourished as a result of the *libertas patavina* that encouraged freedom of discourse and thought and eventually morphed into the materialist Alexandrism of Pomponazzi and Porzio before transforming from Paduan thought to the Italian thought of Bernardino Telesio (1509–1588) and Galileo Galilei (1564–1642) (Troilo 1939). Other twentieth-century historians of philosophy, with Bruno Nardi in the lead, provided close textual studies that enriched and tempered Renan's thesis without rejecting it completely. Nardi emphasized continuities between medieval and Renaissance Averroism, like Renan, although limited its later influence on modern science and thought (Nardi 1958). Stuart MacClintock suggested that Latin Averroism emerged because of the difficulties of reconciling Aristotle with Christian theology, "when natural reason was radically separated from the domain of faith" (MacClintock 1954–1955, 180). It died, in his view, by the availability of Greek Aristotelian texts that revealed Averroes' Platonism. Accordingly, throughout the twentieth-century Renaissance, Averroism was frequently identified, by leading scholars, including John Herman Randall Jr. and Paul Oskar Kristeller, as "secular," "radical," or "Paduan" Aristotelianism (Randall 1961; Kristeller 1965).

In recent years, scholars have attempted to strip away the vagueness of the term and find a more precise definition of Renaissance Averroism that is based on how the word *Averroista* was used during the period. Dag Nikolaus Hasse's *Success and Suppression* presents the fullest analysis of the meaning of the term in the Renaissance to date. He convincingly argues that Averroism was associated with a far broader range of theories than Renan attributed, including the doctrines that proclaim that God only knows universals and not individuals, that God's power is limited, that human happiness results from the conjunction of the separate substances, that prime matter has indeterminate dimension, that the celestial influences play a role in spontaneous generation, in addition to his theory of mixture that maintains the elemental substantial forms remain in the new mixture in a refracted, diminished, or blunted

state (Hasse 2016, 190). Hasse's list is likely incomplete, as he admits. We might also add the doctrines that proclaim that God is efficient cause, not just final cause, of the world, and that celestial bodies, unlike sublunary ones, are not composed of matter and form, as set forth in *On the Substance of the Orbs*.

The term *Averroista*, for Hasse, possesses legitimate meanings useful for historical analysis, despite its frequent employment as a term of abuse for alleged heretics. The first is what Hasse describes as an expert on Averroes' philosophy. The second legitimate meaning refers to a group whose members interacted with each other, building on, or disagreeing with the work of earlier scholars. For Hasse, this group, or sect (*secta*) existed for psychology, beginning with Bolognese masters of the fourteenth century and culminating in the sixteenth century with philosophers associated with Padua, many of whom contended that Averroes' arguments for the unicity of the material intellect were strong, even though they could not be true because they do not conform to Christianity. This Averroistic sect consists of Taddeo da Parma (early fourteenth century), Matteo da Gubbio, (first half of fourteenth century), Giacomo da Piacenza (first half of fourteenth century), Angelo d'Arezzo (died 1422), Paul of Venice (ca. 1369–1429), Niccolò Tignosi (1402–1474), Nicoletto Vernia (died 1499), Alessandro Achillini (ca. 1461–1512), Agostino Nifo (ca. 1470–1538), Luca Prassicio (died ca. 1521), Marco Antonio Genua (1491–1563), Antonio Bernardi (1502–1565), and Francesco Vimercato (1512–1571) (Hasse 2016, 190–91). Furthermore, it might be possible to include in this sect Elijah (or Elia) del Medigo (1458–1493), who discussed in detail and approved of the unicity thesis. Del Medigo considered many of the same sources as other members of the Averroistic sect, while maintaining a distance by not engaging his contemporaries by name (Engel 2016).

Averroism, in this restricted sense, ended not with Cremonini, who did not endorse the unicity thesis, and the demise of Aristotelianism, or because of the efforts of inquisitors and Church councils, but largely for internal reasons.

Giacomo Zabarella (1533–1589), among others, articulated a more philosophically satisfying interpretation of Aristotle's theory of the intellect, rendering the previously esteemed Averroistic theory obsolete. In some ways, this conception of Averroism conforms to Renan's that it considers it to be a movement located primarily in Padua and northern Italy and closely associated with potentially heterodox positions for psychology. The advantage of Hasse's definition of Averroism is that it frees itself from the imprecision with which the term was used by polemicists that equates the term vaguely with philosophical heresy. Rather, it corresponds to the actors' category and defines a coherent cohort of thinkers who openly associated themselves with the most famous, or infamous, doctrine of Averroes, namely, the unicity of the material intellect. This entry, therefore, will consider Averroism according to these limited definitions of Hasse, rather than the expansive definitions of medieval and Renaissance polemicists and earlier historians of philosophy.

Renaissance Averroism as Expertise in Averroes

Although it is difficult to determine whether or to what extent expertise in Averroes grew in the Renaissance, nevertheless it is clear that it was widespread, particularly in Italy, and that Averroes' philosophy was at times divisive and a source of controversy. The high level of interest in his works is evident from the frequent printing of his works and the expansive editorial interventions undertaken to improve the accuracy of the translations of his texts (Schmitt 1979; Burnett 1999). His *opera omnia* were printed in Latin at least ten times, not to mention the numerous printed editions of single works (Cranz 1976).

While part of the attraction of Averroes was linked to his philosophical solutions, interest in him reflects the culture of humanism that had spread and rooted in Italy in the fifteenth and sixteenth centuries. The ideals of humanism involved using ancient writings as models and privileged sources and endeavored to recover

ancient ideas, freed from medieval additions. While Averroes might seem a strange candidate, his professed hermeneutical method of attempting to retrieve the true unadulterated thought of Aristotle combined with his dependence on ancient Greek commentators recommended his writings to scholars who hoped to uncover a pure Aristotelianism (Martin 2014). Some philosophers considered Averroes and Aristotle as being nearly equivalent. For instance, Agostino Nifo wrote that he taught his students that "Averroes is Aristotle transposed" (Mahoney 1970, 453–454). Even after awareness of ancient Greek grew in the sixteenth century in western Europe, despite the fact that Averroes did not know Greek, important thinkers, including Giacomo Zabarella and Giordano Bruno (1548–1600), considered his linguistic ignorance only a minor impediment, if one at all, from uncovering the true mind of Aristotle (Sturlese 1994). As a result, Averroes' own works were subject to investigation in a manner similar to the works of other ancient authors.

A genre of super-commentaries on Averroes emerged in the sixteenth century, much like it had among medieval Jewish philosophers, notably Gersonides (Levi ben Gershon) (1288–1344) (Harvey 2003). Some of the most important philosophers of the Italian Renaissance wrote works specifically dedicated to interpreting Averroes. Agostino Nifo wrote a commentary on the *Destructio destructionis* (*The Incoherence of the Incoherence*). Both Nifo and Pietro Pomponazzi wrote on *De substantia orbis*, as did more minor figures, such as Elijah del Medigo, Giovanni Battista Confalonieri (died 1537), Niccolò Vito de Gozze (1549–1610), and Mainetto Mainetti (died 1572). These commentaries on Averroes, much like commentaries on Aristotle, sought to clarify and interpret the text, while using it as a starting point for philosophical investigation (Martin 2013). Marco Antonio Zimara (1460–1523) wrote a book that sought to reconcile seemingly contradictory statements in Averroes. It served as a philosophical manual. A generation later, Bernardino Tomitano (1517–1576) wrote a similar work of considerations of and solutions to Averroes' texts, which was included in the edition of 1560–1562. Within the sect of Averroists, there

were disagreements about how to interpret him, as a genre emerged for exploring the meaning and significance of his works. Both the philosophical lexica of Antonio Posio (1528–1580), published in 1562, and by Giovanni Battista Bernardo in the 1580s were heavily indebted to Averroes' reading of Aristotle (Schmitt 1979, 130).

The evolution of humanism influenced the reception of Averroes in other ways, particularly in an attempt to apply new philological techniques to the editing, translation, and correction of his texts. From Petrarch (1304–1374) on, humanists had repudiated Averroes and Averroists, in part because of their alleged impiety, in part for the supposedly unrefined Latin prose of their writings. Criticism of Averroes for linguistic barbarism formed a crucial feature of the attacks on scholasticism, universities, and medieval culture, which they hoped to replace with ancient models and emphasized rhetorical eloquence and Latin prose that imitated that the rules and styles of Cicero, Quintillian, and similar authors. Many of the most famed humanists, including Coluccio Salutati (1331–1406), Lorenzo Valla (ca. 1407–1447), Marsilio Ficino (1433–1499), Pietro Bembo (1470–1547), Desiderius Erasmus (ca. 1467–1536), and Juan Luis Vives (1492–1540) in the fourteenth, fifteenth, and sixteenth centuries participated in these polemics against Averroes (Martin 2014, 28–50).

Whether or not these polemics were well founded, by the end of the fifteenth century a number of scholars set out to improve and expand the extant body of Latin translations of Averroes. These philological activities, centered, although not exclusively, in Padua and Venice, were supported and promoted by, among others, Giovanni Pico della Mirandola (1464–1493), the Venetian aristocrat Domenico Grimani (1461–1523), and the Mantuan noble and bishop Ercole Gonzaga (1505–1563), who had studied under and protected Pietro Pomponazzi. The geographical center of this work, most likely, reflects the heavy use of Averroes in philosophical debates at Padua and its neighbors (Di Donato 2013).

Elijah del Medigo was the first representative of this new wave of translators. Beginning in the 1480s, under first the patronage of Pico and then

Grimani, basing his translations on Hebrew texts, he greatly expanded the Averroistic corpus, most notably to include Averroes' epitome of Plato's *Republic*. In the first decades of the sixteenth century, Paolo Ricci (first half of sixteenth century), a physician from northern Italy with a Jewish background, translated Averroes' commentaries on *De caelo* and *Metaphysics Lambda*, as he cited the corrupt text of the medieval Latin translations of Averroes as his motivation (Hasse 2016, 342–343). Not long after, Giovanni Francesco Burana (ca. 1475–ca. 1523) and Abraham de Balme (ca. 1440–ca. 1523), who both lived in Padua, produced translations, primarily of Averroes' logical works. Calo Calonymos ben David (born ca. 1480) translated the *Destructio* in 1527 and included quotations of the *Decisive Treatise* in his work on the creation of the world (Di Donato 2004).

The most important translator was likely Jacob Mantino (ca. 1490–ca. 1549), a physician to Alessandro Farnese (Paul III), and probably a member of the circle of Ercole Gonzaga (1505–1563), a member of the leading family of Mantua and a cardinal beginning in 1527. Mantino, also criticized the medieval translations, as he sought to improve the accuracy of Averroes' texts in his translations from Hebrew of commentaries on logic, natural philosophy, metaphysics, the *Poetics*, Plato's *Republic*, and the *Colliget* (Hasse 2016). Many of these translations were incorporated in the Giunta *Opera omnia*, printed first from 1550 to 1552. The 1560–1562 printing for the *Posterior Analytics*, puts De Balme's, Burana's, and Mantino's translations side-by-side, allowing the reader to compare the three versions (Burnett 2013).

While the success of some of these translations might be questioned, the larger effect was an expanded engagement with Averroes' writings on subjects that are not part of the medieval tradition of Averroism. For example, Pomponazzi used Mantino's translation of the *Paraphrase on the Parts of Animals* in his lectures on the work. It is even possible that the translation was the motivation behind Pomponazzi's decision to comment on a work that was relatively infrequently discussed in university classrooms. In the following decade,

Nifo relied heavily on the paraphrase in his discussions of zoology (Perfetti 2000, 36, 100–109). The translations of the long commentary on the *Posterior Analytics* alerted numerous scholars to the importance of his views on epistemology, recognized not just by Italians but also by the German logician Bartholomaeus Keckermann (ca. 1572–1608) (Burnett 2013, 64).

Renaissance Averroism and the Intellect

Renaissance treatments of Averroes' position regarding the intellect were built upon medieval discussions, most importantly those of John of Jandun (Brenet 2003). But in other ways the Renaissance debates were not a mere continuation of the earlier tradition, as they were infused with new interpretative ideals informed by the growth in expertise in Averroes' writings, and a revived interest in newly available texts, including those of Plato (Mahoney 1986; Mahoney 1993; Kessler 1988). Renaissance authors engaged and polemized with each other by name. They followed upon the polemics of Byzantine scholars, such as those between Georgios Scholarios (ca. 1400–1472) and Giorgios Gemistos Pletho (ca. 1360–1454), and the teachings of the Greek émigré John Argyropoulos (ca. 1415–1487) (Monfasani 1993; Steiris 2018). They debated what were Averroes' views, whether John of Jandun's interpretations were correct, whether Averroes' positions were identical to Aristotle's, and whether they were true (Mahoney 1976; Hasse 2016). The participants in the debates uniformly acknowledged that at least some of Averroes' positions ran counter to Christian teachings yet considered it appropriate to discuss them as part of philosophical discourse. Many of these discussions were highly technical and likely were fully understood by few except those who were trained as philosophers. Nevertheless, they provoked ecclesiastical interventions, first in a local prohibition promulgated by the bishop of Padua, Pietro Barozzi (1441–1507), in 1489 and then later at the Fifth Lateran Council in 1513, when teaching or defending the unicity thesis was explicitly banned.

The foundation for Averroes' position of the soul depended on his interpretation of Aristotle's *De anima*, 3.5, where the active and material intellects are discussed. A primary interpretative challenge for Averroes and other philosophers was to explain how the human intellect could be separable, unmixed with the body. Averroes, like most medieval philosophers, rejected the idea that the soul, as substantial form of the body, emerged from matter. Rather, its separability and its unmixed character corresponded to its immateriality and immortality. According to this psychological theory, the intellect is divided into active and material or passive parts, in an analogical manner to material substances. The material intellect is not in fact material but plays a role similar to that of matter in hylomorphic compounds. Accordingly, the material intellect is the place and recipient of universals, which are eternal and immaterial and stem from the active or agent intellect. In order to avoid the conclusion that these universals are multiplied as they are received by the passive intellect, Averroes in the *Long Commentary on the De Anima* contended that the material intellect is one in number. Universals can be considered with respect to two subjects, what Hasse calls the *duo-subiecta* theory (Hasse 2016, 197). An individual understands universals with respect to the epistemological subject of the soul's imaginative faculty. However, the universals are eternal and single with respect to the ontological subject of the single material intellect, the recipient of the universals. Thus, individual knowledge is possible, the eternity of the intellect is preserved, but its plurality denied with respect to being, a challenge to the Thomistic position that the intellect or the rational soul is the form of the body per se, a position that the Council of Vienne (1311–1312) had made part of the orthodox teachings of the Catholic Church. The position that the material intellect is one in number ran contrary to doctrines regarding personal immortality and the afterlife. Nevertheless, Averroes' solution, which upheld the separability of the intellect and the eternity and uniqueness of universals, while distinguishing the epistemological and ontological aspects of the intellect and intelligible universals, was philosophically

appealing to many philosophers in the decades around 1500.

In Italy, Averroist psychology revived with Paul of Venice (Paulus Venetus) (ca. 1369–1429), an Augustinian hermit and teacher of theology at Padua, who was sympathetic, although not entirely indebted, to the Ockhamist logic taught at Oxford. In disagreement with the nominalists who put forth an argument that he considered to comply with the dictates of natural philosophy, Paul contended that universals represent entities that are external to the mind and are obtained when the material intellect has grasped them through the process of abstraction. Because universals are singular, he argued, so must be the material intellect that receives them (Kessler 1988, 489). The singular rational intellect acts as *forma informans* of the body that gives existence and the possibility of knowledge to humans. Later in his life, Paul, however, maintained that this argument based on naturals was not true according to Christianity, and provided metaphysical arguments for the existence of multiple intellects. Paul's insistence that the intellect is one, only according to natural philosophy, has prompted some commentators to deny that he was in fact an Averroist (Conti 2017). Niccolò Tignosi (1402–1474), a student of Paul's, likewise advocated Averroes' theory of the soul, but with reservations for its theological implications, in lectures at Pisa. Another student of Paul, Gaetano of Thiene (1387–1465), a professor at Padua, while rejecting the unicity thesis, nevertheless considered it an accurate interpretation of Aristotle.

While there might be ambiguity in the case of Paul, it is less apparent in a number of his successors in Padua and Bologna, even if many modified their positions over the course of their careers. Arguing on the basis of naturals, which he considered the genuine position of Aristotle, Nicoletto Vernia (died 1499) assumed the eternity of the world and consequently rejected the possibility of the creation of individual souls. Instead, in his 1480 question on the intellect, Vernia defended the unicity thesis. Vernia followed John of Jandun and argued that the single intellect, connected to the body through the *phantasmata* of sensation, acts as the *forma assistens* and, as such, it joins the body to *phantasmata*, without uniting

to it, by acting like “a sailor to a ship,” that is, operating but being substantially distinct (Hasse 2004).

Vernia's treatment was likely just one of many at Padua during the 1480s, since in 1489, Bishop Barozzi (1441–1507) prohibited public discussions of the unicity thesis under the threat of excommunication. The decree had only local jurisdiction, yet seems to have significantly affected philosophical discourse in Italy. Vernia appears to have revised his views, recanting after the decree, an act that Nardi considered to be intellectually dishonest, as he bended to the Catholic Church's will. Yet, Mahoney (1976) saw Vernia as reacting to the climate of Renaissance humanism, influenced by his reading of Greek commentators. Similarly, Kessler (1988) perceived Vernia to have been similar to Giovanni Pico della Mirandola, in that he weakened the authority of Aristotle and Averroes, while enlarging the body of ancient authorities and trying to find consensus among them. Hasse, however, dismisses Vernia's justification of having been persuaded by the Greek commentators. He construes his use of them to be consistent with Thomas's critiques and calls the affair a “sad case” in that Vernia was a victim of ecclesiastical overreach (Hasse 2016, 203–5). Vernia's later treatise, which rejected Averroes' “insane position,” probably written in 1492, but not printed until 1504, was endorsed by Barozzi and a panel of theologians. Nevertheless, it is possible that at least vestiges of Averroism remain, as Vernia cited Albert the Great's (ca. 1200–1280) views on the intellect, which closely mirror the *duo-subiecta* position. The broader ramifications of the Vernia affair can be seen in the arrival, or renewal, of censorship on philosophy in Italy. For example, even though Barozzi's censure did not extend to Bologna, its effects might be seen in the works of Alessandro Achillini (ca. 1461–1512) who lectured there. Achillini argued that Averroes' unicity was the most probable interpretation of Aristotle, yet it does not conform to either religion or the truth, suggesting that the unicity thesis was philosophically compelling to him and that, by tempering philosophical arguments with concessions to faith, he was engaging in self-suppression.

In the years after Vernia's reversal, Agostino Nifo (ca. 1470–1538) was probably the most important exponent of Averroism, in both the sense of general expertise, as editor and super-commentator on Averroes, and in the sense of participating in debates about the unicity of the material intellect. Born in southern Italy, Nifo studied under Vernia in Padua, where he also taught, before moving to Naples and Salerno, sometime around 1500. Nifo, like Vernia, altered his views about the unicity thesis. Also like Vernia, after being accused of heresy, Barozzi approved Nifo's revised discussions of Averroes (Hasse 2016, 209–210). Nifo repeatedly equated Averroes' views with Aristotle's. Nonetheless, he contended that where Averroes contradicts faith, he in fact errs. In many passages of his *De intellectu*, written around 1492 but first printed in 1502, Nifo rejected the unicity thesis yet presented arguments that appear to support the Averroistic understanding of the soul, including the *duo-subiecta* thesis. In this work, the most emphatic dismissals of Averroes theory of the soul derive not from natural philosophy but from ethics. Nifo argued that what derives from sensation is less certain than the moral truths that stem from religion and revelation. Nifo, influenced not just by Averroes, but by Albert the Great and Plotinus, represents to some an example of Renaissance syncretic tendencies (Holland 2013).

Despite these reversals, or perhaps as a result of them, ecclesiastical censures against the unicity thesis were reinforced at the Fifth Lateran Council. In 1513, the Council promulgated the bull *Apostolici regiminis* that forbade challenging the immortality of the individual soul and, thereby, explicitly condemned teaching the unicity thesis, along with the mortality of the human soul and the eternity of the world. The immediate effect of the bull was limited, and there were even theologians present who dissented (Martin 2014, 60–61). The most vehement debates about the nature of the soul of the Renaissance took place in the decade that followed the Council, after Pomponazzi published *De immortalitate animae*. The participants in the debate openly discussed and even defended the specific propositions condemned by the bull. Pomponazzi argued that according to the philosophical principles of Aristotle it is

probable that the human soul is mortal. Reversing his earlier view that Averroes and Aristotle agreed but were wrong about the unicity of the material intellect, Pomponazzi contended that Averroes' view was fatuous and inconsistent with Aristotelian natural philosophy. Pomponazzi faced threats of heresy charges, which never materialized, as well as attacks from Nifo, who among his other charges, accused Pomponazzi of misinterpreting Averroes.

In those years, Nifo continued to defend his interpretation of Averroes, even if he did not accept it as true, most famously in his exchanges with Pomponazzi and then Luca Prassicio (died ca. 1530). Nifo accused Pomponazzi of falsely positing that Averroes held that, in addition to the immortal intellect that acts as the *forma informans*, humans possess a mortal sensitive soul. Prassicio, in turn, attacked Nifo for misconstruing Averroes. Following John of Jandun, Prassicio accused Nifo of mangling Averroes, most importantly for not recognizing that the intellect acts as a *forma assistens* of the body. For Prassicio, this interpretation was also a way of defending Averroes as positing an immortal soul, despite his recognition that the theory ran counter to Christian dogma. Later, the Jandunian interpretation won over Marco Antonio Genua (1491–1563), who, while lecturing on the *De anima* at Padua, endorsed Averroes reading of Aristotle and linked it to Simplicius's commentary. At the same time, Genua conceded that Aristotle erred, unlike Plato, as his understanding of the soul contradicts Christian theology (Nardi 1958, 452; Hasse 2016, 219–221). In the decades that followed, Francesco Vimercato (1512–1571) and Antonio Bernardi (1502–1565) also endorsed Averroes' reading of the soul, while denouncing it as incompatible with the truths of religion. In doing so, they closed out the long Renaissance tradition of Averroist psychology.

The Decline of Averroism

A number of factors, such as changes in philosophical practice, the revival of Thomism after the Council of Trent, the growth of reading Aristotle in Greek, and internal philosophical

developments, contributed to the decline of Averroism in the last decades of the sixteenth century. The diminishing influence of Averroes is perhaps most easily seen in the lack of adherents to the unicity thesis, as his commentaries continued to be read and cited, particularly by professors in northern Italy, including Giacomo Zabarella and Cesare Cremonini, both of whom refuted the unicity thesis.

In the aftermath of the Reformation, instruction in philosophy changed. Lutheran universities, most notably Wittenberg, while continuing to teach natural philosophy based on Aristotle, were less prone to discuss the multitude of opinions found in late-medieval and early Renaissance lectures, as they aimed to dismiss the scholastic tradition as unhelpful and irrelevant. Alternatively, new curricula designed by Jesuits, specifically deemphasized Averroes' views about the soul. The second scholastic harkened back to the medieval interpretations of Aristotle. The proliferations of editions of Aristotle in Greek – even the Coimbrans' commentary on the *De anima* (1592) contained a version of the Greek text – slowly undermined the authority of the Latin commentary tradition on Aristotle in general.

By the beginning of the seventeenth century, Aristotelian natural philosophy faced numerous competitors, first from the so-called Neoterics, such as Francesco Patrizi (1529–1597) and Telesio, and then by proponents of the new sciences, such as Galileo Galilei and René Descartes (1596–1650). Increasingly, in the seventeenth century, as Aristotelianism waned, the name of Averroes became synonymous with impiety, much as it was for Renaissance humanists, associated not just with the unicity thesis but also with the denial of providence. Emphasizing his impiety and proximity to Aristotle was a means to attack Aristotelianism in general. At the end of the seventeenth century, Pierre Bayle (1647–1706) maintained, most likely truthfully, that no one read Averroes any more (Martin 2015).

Hasse points to internal developments as also contributing to the decline of Averroism, in particular the new Aristotelian theories of the intellect by Philip Melancthon (1497–1560), Giacomo Zabarella, and Francisco Suárez

(1548–1617), that preserved intellection and the individuality of the soul (Hasse 2016, 224–229). It might be added that in a certain sense the success of Pomponazzi's materialist reading of the soul rendered Averroes' position less prominent, as a number of seventeenth-century intellectuals, even if they rejected the mortality of the soul, nevertheless saw it as an accurate reading of Aristotle, and a motivation for forging new philosophies (Martin 2014, 145–168).

Impact and Legacy

The impact and legacy of Renaissance Averroism is perhaps greater in the historiography of the early modern period, as a phenomenon key to understanding the emergence of modernism, the impact of Arabic philosophy in the Renaissance, and ideals of rationalism and faith, than it was on later philosophical thinkers. While Averroes influenced later thinkers, it is difficult to discern the impact of thinkers such as Vernia, Nifo, Prassicio, and Vimercato on later early modern and modern philosophy, especially if the definition is restricted to issues surrounding the unicity of the material intellect. While Bayle, who saw Averroism as a pantheistic philosophy akin to Spinozism that recurred throughout human history, included an entry on Nifo in his *Dictionnaire historique et critique*, he dwelt little on his Averroism. Bayle discussed in depth Pomponazzi, Zabarella, and other Renaissance Aristotelians, who in a strict sense were not Averroists, in order to expose what he considered to be the absurd limitations on and censures of Cartesianism (Piaia 2002). Given a more expansive definition of Renaissance Averroism, such as expertise in Averroes, more influences can be identified. For example, Carlos Fraenkel argues that Spinoza broke with Elijah Del Medigo's Averroistic understanding of the duties of philosophers with regard to the allegories of scripture (Fraenkel 2013).

Perhaps, the most significant legacy of Renaissance Averroism is in the historiographical tradition inaugurated by Renan, which sees these thinkers as exponents of rationalism that countered the repression of the Church or as libertines

avant la lettre, that used subterfuges to disseminate heretical ideas. While the anachronism of such a reading has been noted, Renaissance Averroists' place as both the target of Renaissance humanists' and the object of Thomists' vehement condemnations will likely ensure the persistence of the interpretation of them as impious and linguistically unrefined. Attempts to portray Averroists as scheming and impious, however, should be counterbalanced by the realization that some Averroistic interpretations relied on and conformed to Albert the Great's writings, and that definitions of religious orthodoxy were contested and changed substantially during the fifteenth and sixteenth centuries.

Azpilcueta, Martín de

Born: 13, December, 1492, Barasoain (Spain)

Died: 21, June, 1586, Rome (Italy).

A. Martínez Sobrino

Euskal Herriko Unibertsitatea, Universidad del País Vasco, UPV/EHU, Leioa, Spain

Abstract

Martin de Azpilcueta Jaureguizar is one of the most relevant members of the School of Salamanca together with Francisco de Vitoria and Domingo de Soto. Also known as *Doctor Navarrus* or just *Navarrus*, he was a leading figure in Canon Law and Moral Theology of the sixteenth Century. Nowadays, he is better known as an original and pioneer economic thinker; he was indeed the first to make the clear and definite statement of the quantity theory of money. He is also the discoverer of the Purchasing Power Standards of the foreign-exchange. On Social politics, he held in a speech addressed to the Emperor Charles V the democratic origin of the power and the indirect power of the Church on terrestrial issues.

Alternate Names

[Doctor Navarro](#); [Doctor Navarrus](#); [de Azpilcueta Jaureguizar](#), [Martín](#); [Navarrus](#)

Biography

Born in a noble family in the small villa of Barasoain (Navarre, Spain), Martin de Azpilcueta studied Latin, Rethorics, and Dialectics. In 1508, accepted as one of the first 24 students of the newly founded Colegio San Ildefonso, he moved into the University of Alcalá de Henares, where he got the bachelor in Theology. In 1516, he enrolled in the University of Toulouse and, seven years later, he got the PhD in Canon and Civil Laws. He lectured in both in the University of Cahors

(1522) and in the University of Toulouse. In 1524, having refused the offer of becoming councilor of the Parliament in Paris, he moved to the monastery of Roncesvalles to profess as a regular canon of Saint Augustin – he was ordained in 1515 – but shortly after, he departed to the University of Salamanca to be a lecturer in Canon and Civil law. At that time, the Spanish universities would not accept PhDs obtained abroad, so he earned for a second time (1531) the PhD in Canon and Civil Laws. In Salamanca, he became a very renowned lecturer; his *lectiones* on the *Commentaria in septem distinctiones de poenitentia*, which followed the *Edictum Gratiani*, were attended up to 1000 students, something unheard of. Among the attendants of his lectures stand out Diego de Covarrubias (1512–1577), Arias Pinelo, Francisco Sarmiento, and Pedro Deza (1526–1600). In 1528, the Emperor Charles V listened to the *lectio* addressed by the *Navarrus* on the first property of the kingdom. The Emperor offered him both a position in the Royal Council of Navarre and a canonry in the Cathedral of Pamplona, but Azpilcueta refused them. In 1537, he got the Prima Cathedra of Canons, and shortly after, in 1538, the Emperor asked him to move into the University of Coimbra to occupy the same Professorship held in Salamanca. In Portugal, he gained the appreciation of the king Juan III who, in 1539, appointed him Chancellor of the University and guaranteed to him a permanent monthly salary of 1000 ducats. In 1555, his relationship with the University of Coimbra concluded, and the following year, willing to resume his very much appreciated writings and studies, *Navarrus* returned to Spain, where Philip II offered him both a position in the Council of Castilla and a second one in the Inquisition. Azpilcueta refused both, together with a bishopric Juan III would bid him in a posterior visit to Portugal. Back in Navarre, Philip II requested the *Doctor Navarrus* to defend from the charge of Erasmism presented by the Inquisition Fray Bartolomé de Carranza Miranda, the Archbishop of Toledo, and Cardenal Primate of Spain. The case would be the high point of Azpilcueta's juridical career. The process began in Valladolid, where the Archbishop stayed imprisoned, in 1561. Six years later, *Doctor Navarrus*, due to the unreasonable delays and

the political intrigues, demanded the case to be transferred to the Vatican incurring so the enmity of the King, main guarantor of the honor of the Inquisition. In Rome, Azpilcueta combined his defense of the Archbishop with the positions appointed by both the Pope Pius V and Charles Cardinal Borromeo, first of advisor in the Supreme Penitentiary Tribunal and then of Major Penitentiary. His fame was such that Pius V did try twice – in 1570 and 1572 – to designate him Cardinal, but the Philip's II antipathy impeded it. Nevertheless, *Doctor Navarrus* enjoyed the friendship of the Popes Pius V, Gregory XIII, and Sixtus V, to whom also counseled. In 1586, at the age of 93, Azpilcueta died in Rome where he was buried in the national Church of San Antonio de' Portoghesi.

Heritage and Rupture with the Tradition

Doctor Navarrus exemplifies better than many of his contemporaries the spirit of the universities in the epoch. In a time where many questions on the limits of the Church and the Civil Power raised, he, together with his colleagues of the School of Salamanca, strained on updating the accustomed medieval canons and customs in order to address the Church and Civil powers to their fair exercise. Azpilcueta coped successfully with many arising issues, which were to induce a theological renaissance. Among the factors which provoked it, there were theological factors, such as the Protestant reforms, and nontheological ones, such as the new idea of man and society, the European demographic expansion, the surge of modern national states, the discovery of the New World, the massive affluence of precious metals, the new markets in the Indies, the development of banking activities, the new forms of payment, etc.

Innovative and Original Aspects

Navarrus, unlike the canonical doctrine of the time, endeavored both to promote a reform of customs and to form the conscience of a society needful of amendment in the ecclesiastic discipline. Aware that neither the *Ius Decretalium* nor

the Canons inherited from the Medieval Age could give, in their customary form, the correct answers to the ethical problems arising up, Azpilcueta sought in the tradition, specially, in the *Edictum Gratiani*, perennial criteria upon which base the canonical principia. Convinced that the foundation of a moral opinion should not be supported by speculative arguments, but by the texts or *auctoritates* endorsing it, and conscious that the regular medieval inert repetition of the *formulae* was not useful anymore, he struggled successfully to clarify different canonical areas on specific living problems which demanded enormous erudition and very good criteria. So by safeguarding his own conventions on different matters, by pointing out some lacks of the authors and, occasionally, by confronting contemporary ones, *Doctor Navarrus* gathered everything right and valid from the theologians and canonists from the twelfth to the sixteenth centuries to reach the convergence of the different doctrines. Thus, by offering the possibility of the inclusion of many normative, doctrinal, and historical erudition and by keeping the scholastic exposition of the jurist, that is, by making continue references to the authors instead of stating new rules, he changed forever the status of the Moral Theology from a prescientific *ars* to an independent scientific discipline.

Azpilcueta, troubled as he was by the realms of the salvation of souls, bothered himself with many branches of knowledge and showed a great concern in writing morally profitable dissertations.

Impact and Legacy

It is almost impossible to list all of the editions of *Doctor Navarrus*'s production for, besides being a very prolific writer, he was very keen on the accuracy of his texts, to the point that he would attend his publications making corrections, additions, etc. Still, his writings can be classified under four major groups: (1) Canon Law, on which he treated many living problems under the form of commentaries to the *Edictum Gratiani*. (2) Moral Theology, on which the most important writing is the *Manual de confesores y penitentes* (1556) later known as *Enchiridion sive manuale*

confessariorum et poenitentium (1573). (3) Ascetic and spiritual writings: *Enchiridion sive manuale de oratione, et horis canonicis*, Roma, 1577–1578 (Lyon, 1580; Roma, 1586), *Commentarius de paupertate* (1575). (4) Apologetic works: *Carta apologética a Don Gabriel de la Cueva (Duque de Alburquerque)* (1571).

Azpilcueta's most important doctrinal contributions were in the two leading fields of the time, Canon Law and Moral Theology. Fields on which Lawrence Beyerlinck granted him to be the greatest jurist among the theologians and the greatest theologian among the jurists.

His lectures, both in Salamanca and in Coimbra, on the *Edictum Gratiani*, addressed in order to raise its authority, were collected in the *Commentaria in septem distinctiones de poenitentia* (1581). In them, Azpilcueta deals with the most difficult titles of the Decretals together with the comments to the Decree. *Navarrus* maintains the order of the text set by Gracian but distributes the seven distinctions of the penance in three basic groups: (A) The relation of the penance with the justification and the implantation of the virtues. (B) The fundamental doctrine of the penance: the relations between the contrition, the sacrament of penance, and the reparation; the need of confession for the remission and the obligation of the confession of the sins; the contrition and the will to confess; the inner penance and the sacrament of penance. (C) The authoritative principles of the administration of penance that stand out for their pastoral dimension according to which the ecclesiastical nature confers a customary power of absolving which can only be exercised over a faithful subject liable to a particular priest. Ideas he later completed in works such as the *Commentarius de anno iubeleo et indulgentiis omnibus* (Milán 1573; Roma 1575, 1585), the *Commentarius de silentio in divinis officiis praesertim in choro servando* (1580, 1584), *Miscellanea centum de oratione, praesertim de psalterio et Rosario Virginis matris Mariae* (1586), the *Commentarius de oratione, horis canonicis atque aliis divinis officiis* (1590).

In the *Tratado de las Rentas de los beneficios eclesiásticos* (1566) or *Tractatus de redditibus beneficiorum ecclesiasticorum* (1568), Azpilcueta defends the doctrine on benefits of the revenues,

that is, on the right that assists the beneficiaries regarding the reimbursements of ecclesiastical profits. For him, the beneficiary's right over the revenues of the benefit does not convert them in the owner of the profits neither does it allow them to dispose of them by the inter vivos act or by testament. On this subject, he also asserts that beneficed clergymen are free to expend the fruits of their benefices only for their own necessary support and that of the poor. In addition, he also declares that the use of money in exchanges is natural, and that money is on the same level as any other merchandise, and so the morality of exchanges does not depend on money as their object, but on an equitable exchange.

In the *Relectio cap. "Novit,"* (1548) *Doctor Navarrus* was the first to formulate the doctrine of the indirect power of the Church in terrestrial issues and the origin of the civil power. He considered that everything instituted in order to an end is ordered, instituted, and contracted according to what that end demands. Thus, he follows, it happens that God's celestial power has been instituted both, to govern supernatural realities and to direct mortals to eternal life; and so, it extends to the temporary only insofar as it is required by the reason of the supernatural and not beyond. He also specifies that, as of the doctrine that knows the divine origin of power, the secular power is given immediately by God, who confers the authority to the community for their being the primary subject, the first depository of the secular power. Thus, the real power is by natural right of the community, who cannot renounce to it, and not of the king, who, save for few exceptions, is always the second cause.

Azpilcueta also applied himself to the administration of the Church and to the inquisitorial functions of the magistrates. Themes on which he disserted in writings such as *In capt. "Si quanto,"* "*De rescriptis,*" (1543) *Relectio in cap. "Cum contingat,"* "*De rescriptis,*" (1575) y *Commentarius de datis et promissis pro iustitia vel gratia obtinendis*, (1575) *Consilia et responsa* (1601). Convinced that the trial-processes have more to do with the virtue of justice than with prudence, *Doctor Navarrus* in the *Commentarius utilis in rubricam "De iudicis"* (1548) provides the judge with solid moral criteria to strengthen

his will for justice. He instructed the judge to acquit the convict if the accuser does not prove what he alleges; he also reminds that the judge sins gravely if, lacking sufficient evidence, he strains the convict to answer under torture or oath.

On Moral Theology, his *Enchiridion o Manual de Confesores y penitentes* (1556) or the *Enchiridion sive manuale confessoriorum et poenitentium* (1573) is without any doubt, together with the *Commentaria in septem distinctiones de poenitentia* (1581, 1586), his most influential work. Dedicated to the sister of Philip II, the Princess Juana, Azpilcueta's friend and patroness, it was originally written in Portuguese, and, due to its great success, it was reprinted 81 times between 1549 and 1625 – translated into Spanish, Italian and Latin – by himself in Rome in 1573. As in the *De poenitentia*, the brilliance of the text lies on *Doctor Navarrus's* ability to structure systematically the moral precepts to the point of switching the Moral Theology to an independent scientific discipline.

The organization of the *Manuale* by *Navarrus* made needless the burden of having to read over and over the medieval *Sumae* to inform about an issue. Azpilcueta arranges the *Enchiridion* in 26 chapters which can be thematically grouped in two major sections of ten chapters and a third containing the remaining six. The ten first chapters expose the guiding criteria of the sacrament of penance and the acts of the penitent and the confessor; the next ten explain the moral duties arising from each of the commandments of the Decalogue. The remaining chapters explain the following commandments: the 21st, the five of the Church, the 22nd, those concerning the Sacraments, the 23rd those on Pride and Deadly Sins, the 24th those on the external senses and the Works of Mercy and Fraternal correction, the 25th the sins of the various states; and the last chapter, the 26th, the duties of the Church.

Nevertheless, the importance of the handbook lies fundamentally on Azpilcueta's treatment of the ethical aspect of the commercial transactions. Meant to provide moral guidance for pastors and penitents, the *Manuale* surpasses the boundaries of the Catholic Catechism for its indirect analysis of sixteenth-century economic realities –

explorations on exchange practices, supply and demand, and the nature of money, etc. – to become the main milestone for the transformation of the Moral Theology into an independent scientific discipline. The growing commercial transactions rose in Azpilcueta the interest for the treatment of money as a base for the moral regulation of economic dealings among citizens of the same country and of different nations. To them he devoted the five *appendices* of the *Manuale* in the edition of 1556: el *Comentario resolutorio de cambios*, *Sobre la usura*, *Commentarius de usuris*, in *Cap. “Si feneraveris,” la Simonia*, en la *Defensa del prójimo y el hurto*. Out of which the most relevant will be the *Comentario resolutorio de cambios*.

In these added commentaries to the *Manuale*, *Doctor Navarrus* explains that the value of the money is not determined by nominal and metallic factors but by its interrelationships with goods. Supporting the commonly held view that the value of money, like that of goods, varies according to supply and demand, *Navarrus* first defines the quantity theory of money. A theory whose foundations had been laid by medieval writers, but which Azpilcueta brought to life because he had witnessed in first-hand the rising of prices and wages in Spain as a result of the imports of American gold and silver.

Doctor Navarrus wrote on pure moral-science itself the three following contributions: *De finibus humanorum actuum* (1571), in which he solves how the ends alter the acts of virtue or the sins; the *Commentarius in cap. “Inter verba”* (1584, 1588) about how honor, praise, and good reputation should be based on the truth and the testimony of one’s conscience; the *Commentarius in cap. “Humanae aures”* (1583) on the difficult problem of the possible legality of an amphibological response for a just cause that can be presented to a confessor or to any other person sued and interrogated in court.

Abstract

The general aim of Francis Bacon's philosophy was the reformation of human knowledge, with the intent to put it into practice and use it for the benefit of humankind. He criticized Aristotelian-Scholastic philosophy on the grounds that its method was unable to bring about progress. Bacon's method of induction was the antidote to the idleness of previous philosophies, and it had a twofold function. First, it was supposed to eradicate the errors and idols from human mind, so that this could become like a polished mirror in which the nature could reflect itself, leading to the cultivation of virtues and elimination of vices. Second, it was supposed to discover the inner structure of matter and its activity. This was done by gradual abstraction and, most important, with the help of experiments. Bacon's emphasis on experience and the use of experiments as the right tools to be employed in the study of nature was an idea that influenced future generations of philosophers, and it

is considered a building stone in the establishment of the societies of knowledge founded in the second half of the seventeenth century. Bacon contended that his method of induction should be employed beyond the study of nature into other disciplines, such as ethics. This enterprise, he believed, would bring about not only knowledge, but also welfare and happiness.

Alternate Names

[Lord Verulam, Francis Bacon; Viscount St. Albans](#)

Biography

Francis Bacon was born in London, on January 22, 1561. His father, Nicholas Bacon, was the Lord Keeper of the Great Seal of England during the reign of Elizabeth I. His mother was Anne (Cooke) Bacon, the daughter of Sir Anthony Cooke, the tutor of Henry the VIII's son, Prince Edward. All the Cooke sisters, including Anne, were successfully matched with powerful men, providing the Bacon family with important political connections. Moreover, Francis and his older brother Anthony received a very good humanistic education from their mother, which is prominent in Bacon's later writings.

When he was 12 years old, Francis went with his brother Anthony to study in Cambridge.

There, at Trinity College, they continued receiving a humanistic education. In 1576, at age 15, Francis travelled to Paris with the British ambassador. He remained there for almost 3 years, only returning to England in January 1579 upon hearing of his father's unexpected death. Though Sir Nicholas arranged profitable marriages and set a good inheritance for all his older children (two with Anne and six with his first wife), he died before making any arrangement for the youngest, Francis. This fact affected Bacon for the rest of his life, who struggled to pay his monthly expenses, was arrested for debt; and even in his wealthy years, he was in debt due to his flamboyant and expensive lifestyle. The financial problems would be a recurrent theme throughout his life.

After his return to England, Bacon went to Grey's Inn, one of the four inns of the court, professional associations for barristers and judges in London. In 1581, he joined Parliament, and in 1584 he became part of the committee dealing with the redress of disorders in common informers. In the same period, he also tried to receive advancement at the Inn, but unsuccessfully. Moreover, his attempts to expedite an early promotion to full bench status before he was fully eligible created problems at Grey's Inn. However, with the help of his uncle, Lord Burghley, Bacon was promoted in the spring of 1586 and even attended the pensions, the governing council of the inn. In 1588, he was elected Reader, possibly with the direct intervention of Queen Elizabeth.

However, the queen's attitude toward Bacon grew less favorable after he argued for granting her fewer subsidies in 1593. This affected Bacon's career, making his promotion impossible, a fact that led Bacon to considering dedicating his life to study. However, this did not happen. Bacon continued to be a member of the Parliament, even though without a crown office, and he was employed by the queen in several legal capacities. The Earl of Essex, Bacon's patron and friend, tried to intervene and bring him back on the political stage, but the auspicious situation changed for Essex himself. Judged guilty in 1600 for his decisions during his campaign in Ireland, Essex was dismissed from all political offices. Bacon also

spoke against the Earl of Essex and it has been considered that he might have influenced queen's attitude against Essex. Essex was eventually executed for treason in 1601, and it was Bacon who wrote the official account.

Bacon's situation improved after the coronation of James I in 1603, whom Bacon supported and whose favor he gained by appealing to his pretence of being erudite. The same year, he was dubbed Sir Francis Bacon, a promise made by Elizabeth but never fulfilled. Later, in 1607, after continuing to serve in the Parliament with a somewhat anomalous status, Bacon finally received a crown office – that of Solicitor-General, which provided him with a good annual income. However, only 1 year later, in 1608, he became Clerk of the Star Chamber, and then in 1613, Attorney-General. This time period coincides with the beginning of Bacon's prolific writing of natural philosophical texts. In 1605, he published *The Advancement of Learning*, dedicated to the king, followed by *De sapientia veterum* in 1609. Several other works circulated in form of manuscript over the next few years. Also, in 1606, Francis Bacon married Alice Burnham, the daughter of the deceased Sherrieff of London, whose stepfather had arranged a high dowry for her. Later on, Bacon tried to make use of his relation to her family: he settled the marriage of one of Alice's sisters and tried to instrument another one for his own financial benefit (Jardine and Stewart 1998).

As Attorney-General, Bacon's ascension continued, given that he played key roles in several political matters and off-stage affairs, through which he secured his position. In 1617, Bacon became the Lord Keeper, an office once held by his father. Bacon's fortune became even more favorable when, as a result of his activity and connections (in this case with the Duke of Buckingham, George Villiers), was made Lord Chancellor in January 1618 and in July of the same year, Baron Verulam of Verulam.

In the next couple of years, though Bacon's political activity was intense, his image started to become undermined: his ostentatious entrances were criticized and his rhetorical style mocked. This setback, combined with the cumulative effect of a series of minor challenges, led to

Bacon's fall from political office in 1621 (Jardine and Stewart 1998, p. 433). Though in January 1621, again with the help of Buckingham, Bacon is made Viscount Saint Alban, he was charged with accepting bribes 2 months later. From the initial two cases, the final charge numbered twenty-eight counts. Bacon gave up his original intention to defend himself for each particular case and gave a generalized submission for all the charges. It is believed that this happened because the king wanted to protect Buckingham by sacrificing Bacon (Jardine and Stewart 1998). This would also explain why neither the king nor Buckingham intervened for Bacon. After Bacon sent the submission for each charge, he was punished with a £40,000 fine, imprisoned in the Tower of London, and dismissed from the parliament and all public offices. His title, however, was not suspended. After only a few nights of imprisonment in the Tower of London, he was released. Bacon hoped to regain his status but was asked to retire to Gorhambury, his residence.

Bacon spent the last 5 years of his life working on his philosophical writings and performing experiments, though he never lost hope of returning to politics, and even served on the Privy Council in the last years of James' reign. It was during this time when he completed or rewrote several writings that had started in the early years and published most of his parts of the *Great Instauration*. During a trip, Bacon fell ill and died at the Earl of Arundel's house in Highgate, near London. In one of his last letters, Bacon claimed that he would die as Pliny the Elder, "by trying an experiment." The story that he got a cold as a result of preserving chickens in snow is probably nothing more than an anecdote, but it is very likely that he was indeed studying the processes of preservation and induration of bodies. It might also be, given the descriptions of the symptoms, that he was trying to cure his illnesses with soporiferous substances (Jardine and Stewart 1998). Though Bacon wanted to be buried in St. Alban, it was later discovered he was not buried there, a fact that gave birth to several conspiracy theories. Moreover, the financial issues that had bothered Bacon during his lifetime continued, with his will and possessions creating

several difficulties for his servants, wife, and creditors. His manuscripts were published in the following years by William Rawley, Bacon's last secretary and amanuensis, and by Isaac Gruter, who had inherited the papers from William Boswell, Bacon's brother-in-law.

Heritage and Rupture with the Tradition

Throughout the history, Bacon was considered to be the first promoter of experimental philosophy and of the inductive method. Bacon criticized the Aristotelian-Scholastic philosophy, which was a prevalent view of the universities in the beginning of the seventeenth century. In doing so, he emphasized the importance of studying nature through experimentation, and not through mere observation or analysis of ancient philosophical texts. Moreover, Bacon was equally critical of his contemporaries for not finding the right method able to advance human knowledge. Despite his openly critical attitude, Bacon's relation with the past philosophies is in fact a highly complex one: he admits that there are seeds of knowledge in the ancient and modern authors which should be both valued and used, something he does himself. However, his sources are difficult to capture given Bacon's eclecticism and the lack of references to these sources.

Bacon's attitude toward received philosophies seems to have changed over the course of his life, from very critical to more moderate. In Bacon's early works, such as the unpublished *Cogitata et visa* (*Thoughts and Conclusions*) and *Redargutio philosophiarum* (*Refutation of Philosophies*) (written in 1607 and 1608, respectively), what is at stake is the criticism and rejection of past philosophies. This rejection is crucial, according to Bacon, in order to make the advancement of science possible; otherwise, these philosophies will keep obstructing the acquisition of knowledge. In the *Cogitata et visa*, Bacon affirms that all previous theories, opinions, and notions should be brushed away, so that the mind can be brought in contact with facts without any bias. Several of the ideas exposed in these early texts are to be found in later published works,

particularly the first book of the *Novum organum* (1620) where Bacon discusses the current state of natural philosophy before presenting his own method. However, in his later writings, Bacon is more charitable toward tradition, affirming that he would spend time on received ideas, with the aim of perfecting them and of gaining access to new ones through them.

Another important aspect of his relationship with tradition is the fact that Bacon challenged the status of authoritative figures and texts. According to him, if philosophers worship ancient authority they are merely teachers exposing the ideas of those authors, but not inventors and thus there can be no progress. The only authority one should accept is nature itself. That is why received opinions and theories have to be tested and confronted with facts prior to being accepted in the body of knowledge or rejected from it. As expected, his criticism aims at both the Aristotelian-Scholastic philosophy and that of his contemporaries. His solution for the lack of progress is a method that follows the order of nature in acquiring theoretical knowledge, while protecting the mind as much as possible from error. This is Bacon's method of induction, which in fact should be applied to all areas of knowledge.

The Criticism of the Previous Philosophies

When it comes to refuting previous philosophers and criticizing the deplorable state of philosophy, Aristotle's name is the one repeatedly reoccurring in Bacon's writings, starting with the early ones. He gives two main criticisms toward Aristotle: first, that his philosophy was infested by logic and, second, that his philosophy corrupted almost the entirety of philosophy produced after him. Starting with the second concern, according to Bacon, Aristotle was guilty for having reduced many splendid intellects to mental slavery, being responsible for the "deplorable state" of Scholastic philosophy, and in consequence, for the lack of advancement of knowledge for hundreds of years. As for the first issue, the infestation of philosophy with logic, Bacon contented that, instead of engaging in studying nature, Aristotle busied himself with comparing, contrasting, and analyzing notions about

nature. His use of the syllogism was not adequate to capture the subtlety and obscurity of nature. Against Aristotle's deductive method, Bacon proposed his induction as the only suitable way to investigate nature. Moreover, even if in the biological writings Aristotle mentioned experience, Bacon concluded that in fact Aristotle first established some theories and then he provided some empirical evidences that were in agreement with his theories. Thus, he is more blameworthy than his Scholastic followers, who completely ignored experience.

Plato was, for Bacon, a man with a deeper understanding than Aristotle because he engaged with the knowledge of forms and he employed induction. However, Bacon suggests that Plato actually failed in both – because his forms were abstract and his induction was based on superficial and vulgar materials. Bacon's conclusion is that Plato's writings on natural philosophy have thus no foundation in facts. In a similar way in which Aristotle mixed philosophy with logic, Plato corrupted it by mixing it with theology.

According to Bacon, pre-Socratic philosophers such as Anaxagoras, Leucippus, Democritus, Parmenides, Empedocles, and Heraclitus all advanced ideas closer to truth than those of Aristotle or Plato, because they all conceived, in different ways, primary matter as having the source of activity in itself. The only exception is Pythagoras, who Bacon insists founded a religious order, and not a school of philosophy. Among the pre-Socratics, Democritus was the one to whom Bacon paid most tribute in his writings. He admired Democritus for having dissected nature instead of abstracting it like Plato and Aristotle. This is why he was the only one to arrive at "minima," the smallest particles of matter out of which all things are composed. Democritus, and other atomists, comprehended that the activity of nature is caused by some imperceptible entities within matter itself. Even if Bacon did not agree with all the premises of the atomist philosophy, such as the void, he still considered this theory to be closer to the truth than any other ancient theory.

Turning now to modern authors, in both the *Cogitata et visa* and *Redargutio philosophiarum*,

Bacon mentioned the new generation of philosophers (Bernardino Telesio, Girolamo Fracastoro, Girolamo Cardano, and William Gilbert), but only in order to criticize them. They should just be put together with the ancients, Bacon stated, because they either did not engage in a proper study of nature, or, if they did it was only with some specific experiments, which did not grasp the variety of nature. However, all of them influenced Bacon in various ways, either in his speculative or his experimental philosophy. Telesio was probably the one to whom Bacon attributed more importance. In 1612, he wrote a treatise, not published during his life, *De principiis atque originibus* (*On Principles and Origins*), in which he discussed the philosophy of Telesio, Parmenides, and Democritus. The book is an analysis of the fable of Cupid, which for Bacon is the symbol of atom, and it explains how nature was created from the first atom. Bacon argued against Parmenides and Telesio, both who claimed that there are two principles of things: fire and earth for Parmenides, and heat and cold for Telesio. Bacon considered that none of these can be principles because they are changing entities, and not immutable as principles should be.

Influence of Magic and Alchemy

Regarding the operative disciplines such as alchemy, magic, and mechanics, Bacon's attitude was critical but at the same time he admitted that the work of some members of these crafts is preferable to that of Scholastic natural philosophers. The reason for this preference is the fact that the former work with nature, while the latter take their ideas about nature from books, without making any use of experience. Alchemy, for example, reduced the study of nature to few experiments on distillation, separations, and liberation, and its speculative philosophy was full of errors and based on phantasy. While trying to produce gold, the alchemists made several discoveries from which human life benefitted. Magic, on the other hand, is based on fancies and superstitions and, instead of producing genuine effects, it only excites wonder. Moreover, their very few discoveries are trivial and akin to imposture. Finally, for mechanics Bacon had more admiration than for

the other practical arts. The mechanical arts are, according to Bacon, founded on nature and the light of experience and for this reason they flourish and always progress. Despite these criticisms, magic (and also alchemy to a lower extent) shaped the Baconian program: on the one hand, magic was using the natural powers of bodies to bring about practical ends; on the other hand, the only way to discover those powers was through trials and experiments. Both these ideas stay at the basis of the Baconian method (Henry 2002).

Bacon's Sources

There is still much work to be done in identifying Bacon's sources and in analyzing his originality in dealing with them. His philosophy has often been characterized as "eclectic." However, the variety of sources does not mean Bacon's system is not original and coherent at the same time. It is his fierce criticism toward most of the representative philosophers of both antiquity and modernity that makes following the influence these philosophers exercised upon Bacon's thought difficult. His humanist education can be easily seen from his works *The Advancement of Learning* or the *De augmentis scientiarum*. Ancient authors, especially the Stoics and Epicureans, influenced his ideas on matter. Bacon's natural and experimental histories are filled with experiments borrowed from natural magic (especially from Giambattista della Porta's *Magia naturalis*, second edition, 1589), alchemy, books of secrets and recipes, agriculture, etc. Another source for his more practical writings are the travel books, especially those about the New World, like Jose de Acosta's or Nicolas Monardes', and also those about other parts of the world, such as George Sandys' treatise. However, two of the most important sources of his natural histories remain Pliny the Elder's *Historia naturalis* and Pseudo-Aristotle's *Problemata*.

Innovative and Original Aspects

The Great Instauration

Bacon's solution to the errors generated by the previous philosophies (both ancient and modern)

was his inductive method. The idea of induction appeared in his early unpublished works and was developed in the *Instauratio magna*, Bacon's project for the reformation of knowledge. Bacon considers that induction is the method that gradually gathers information about nature and brings it to the understanding, which creates axioms, first middle axioms, and then general ones. Put it differently, induction starts from the variety of particulars and arrives at the universals, or what Bacon considers "forms." First, facts are collected, then ordered into tables, and lastly generalizations can be made, on the basis of the information from the tables. Theoretical knowledge or axioms, even less general ones, which do not arrive at universals, are accepted as long as no contradictory instance can be found.

This method was supposed to eliminate the four main problems of the current natural philosophy: (1) that the information provided by the senses is not accurate; (2) that notions are poorly abstracted from the impressions of the senses; (3) that induction based on enumeration, without exclusions and separations, is useless; and (4) that establishing first general principles and then establishing middle axioms from these general ones is the "mother of all errors" (Bacon 1996-, vol. XI). This last point is connected to Bacon's distinction between anticipation and interpretation of nature. According to him, there are two ways to investigate nature. One goes from the senses and particulars to very general axioms, and it is from these general axioms that middle ones are inferred. This is the anticipation of nature, and it does not provide knowledge, because it is very easy for the mind to make mistakes in the passage from facts to general axioms. The other way is by drawing axioms from senses and particulars by degrees until it reaches the highest generality at the end of the process. This is the interpretation of nature, or induction. Bacon's induction should not be applied to natural philosophy only. He considered that other disciplines, such as logic, ethics, and politics, could benefit from his method. All these disciplines can start from the compilation of tables, and apply induction according to the nature of things.

In 1620, Bacon started publishing his project on the reformation of knowledge, the *Instauratio magna* (*The Great Instauration*). As the title of the project suggests, its aim was to provide a method that will help humankind regain its central role as the king of creation, which includes the knowledge Adam had before the fall of man. In turn, this knowledge will improve human life, providing new discoveries and resources. Human life can be improved if one discovers medicines, makes bigger crops, and produces objects that alleviate men's work. The *Instauratio magna* was planned to be composed of six parts:

1. *The Partitions of the Sciences*
2. *Novum organum*, or *Directions concerning the Interpretation of Nature*
3. *The Phenomena of the Universe*, or *Natural and Experimental History for the Building up of Philosophy*
4. *The Ladder of the Intellect*
5. *Precursors*, or *Anticipations of the Philosophy to Come*
6. *Philosophia Secunda, sive Scientia Activa*.

From the six, only the first part was finished, published under the title *De dignitate et augmentis scientiarum* (*On the Dignity and Advancement of Learning*, 1623, a development of the 1605 *The Advancement of Learning*). The second, the *Novum organum* (*The New Organon*) was planned to have six parts, but only two of them were published in 1620, together with the introduction to *Instauratio magna*, and the short treatise, *Parasceve at historiam naturalem et experimentalem* (*A Preparative to a Natural and Experimental History*), and a *Catalogue of particular histories*. Bacon planned six natural histories to form part of *The Phenomena of the Universe*, only two of which were published during Bacon's lifetime, *Historia ventorum* (*History of the Winds*) in 1622 and *Historia vitae et mortis* (*History of Life and Death*) in 1623. A third one, *Historia densi et rari* (*History of Dense and Rare*), appeared in 1658 and a fourth might have been written, *Historia gravis et levis* (*History of Heavy and Light*), but if so it is lost. From this last one and from other two, *Historia sympathiae et*

antipathiae rerum (*History of the Sympathy and Antipathy of Things*) and *Historia sulphuris, mercurij et salis* (*History of Sulphur, Mercury, and Salt*), only the introductions arrived to us, published with the *Historia ventorum* in 1622. (It is probable that only the introductions were ever written.) The last three parts of the *Instauratio magna* were never published, and only a fragment discovered later, the *Abececlarium novum naturae*, was probably prepared to compose the fourth part. This unfinished and fragmentary character of Bacon's works explains why Bacon's philosophy is not systematic, but it also represents a characteristic of Bacon's philosophy as collective and of his vision of his own philosophy as model and incentive to further investigation.

The Idols of the Human Mind

Bacon saw the relation between the mind and the human knowledge as a mirroring one: the human mind is a mirror in which nature should reflect itself. However, after the fall of man, the mirror stopped reflecting nature in an accurate way. Minds are now full of "idols," errors, and false notions. By idols, Bacon means natural tendencies and defects of the mind, which hinder the acquisition of knowledge. In the first book of the *Novum organum*, Bacon described four classes of idols. Some are innate, others are extrinsic: the innate are rooted in the nature of the intellect, which have a tendency to make errors, even more than the senses; the extrinsic idols enter the human mind either from dogmas and sects of philosophers, or from misguided laws of demonstration. The extrinsic idols can be eliminated, but the innate cannot. One can draw attention to the possibility of error, and the best weapon against them is to use induction, which has means of discovering a mismatch between nature and theories. Let's now discuss the four types of idols separately.

The "Idols of the Tribe" are rooted in the human nature. They originate from the evenness of the substance of the human spirit, its preconceptions, its narrowness, its restlessness, from contamination by the affections, or the inadequacy of the senses. It is because of these idols

that men do not look further than what is visible; and when they do, they abstract from nature rather than search what is in nature, such as spiritual matter, schematisms, and laws of motion.

The "Idols of the Cave" belong to the particular individual, and they arise either from someone's own nature, education, the books that person read, or from the impressions these all make on the soul; put it differently, they come from the tendency to excessive composition and division, from love of studying certain periods, or from contemplating large- or small-scale objects. Examples of this type are Aristotle, who made his philosophy a slave of logic, or William Gilbert, who created a philosophy explaining the entire natural world based on very few observations about magnets.

The "Idols of the Market" are derived from the mutual agreement and association of human race; they entered the mind because of alliances between words and names. They are either names of things that do not exist (such as "first mover," "the element fire") or names of things that are ill-defined and roughly abstracted from the things (such as "radical moisture").

The "Idols of the Theatre" (or "Theories") entered men's mind from the dogmas of the philosophers and misguided laws of demonstration. The cause of error resides in three kinds of false philosophy: Sophistical, Empirical, and Superstitious. The most illustrative example of the first class is Aristotle, who corrupted natural philosophy with dialectic; the second class invented theories based only on a few experiments, like the sect of the alchemists or William Gilbert; while the third mixed natural philosophy with theology, like Pythagoras and Plato.

The Disciplines of Knowledge

The first book of the *Instauratio Magna, De dignitate et augmentis scientiarum* (1623) contained the tree of knowledge, a scheme of all the disciplines pertaining to human knowledge. The *De augmentis* is an enlargement of the earlier treatise *The advancement of learning* (1605). The first book of both writings constitutes a eulogy of knowledge and a defence of it from all the possible attacks and criticisms raised by theologians and men of estate. Bacon argues that

knowledge can only lead to the improvement of human nature, by making men more devotional and eradicating heresy, by making them better citizens, by cultivating virtues and eliminating vices.

In the following books (one in the first short edition, expanded into eight in the *De augmentis*), Bacon exposes his structure of human knowledge, offering detailed definitions, descriptions, and illustration of all the disciplines of human knowledge. His own tree of knowledge is picking influences from Aristotle, medieval Christian authors, and humanists. The three main disciplines correspond to the three faculties of the mind: history corresponds to memory, poetry to imagination, and philosophy to reason. History can be natural or civil (the last can be further divided into ecclesiastical, literary, and civil); poetry can be narrative, dramatic, and parabolic; while philosophy can be of deity, of nature, and of man. These three branches meet in one trunk, which is "*Philosophia prima*," defined by Bacon as a receptacle for those axioms which are common to more than one science, even if not to all of them. The *Philosophia prima* also comprises the "Adventitious Conditions of Essence," such as Much and Little, Like and Unlike, or Possible and Impossible. Bacon compares his classification of sciences to the branches of a tree: in the same way in which the branches meet and are intertwined, in the same way one subject can be studied by more than one discipline, while information must be communicated from one discipline to another, leading to a better and quicker advancement of each of those disciplines.

Natural and Experimental History

For Bacon, knowledge of nature starts with the accumulation of natural histories. Before offering the readers his own histories, Bacon first criticizes the histories written by his contemporaries, and then he devotes himself to defining and illustrating how a proper natural and experimental history should be written and what it should contain in order to constitute the material for natural philosophy. At the end of the *Novum organum*, and before the *Historia naturalis et experimentalis*, Bacon includes a short treatise *Parasceve ad*

historiam naturalem (*Preparative for Natural History*). The main criticism toward the existing natural histories is that they only contain descriptions of nature and not reports of experimental practices. In order to be complete and to be used as material for induction, natural histories should contain three subdivisions: histories of generation (nature free); histories of monsters or preter-generations (nature erring); and histories of arts or experiments (nature bound). The last one is, according to Bacon, the most important.

The first two types of histories contain observations, so they are based on experience; the last is composed of experiments. The difference between experience and experiment is that experiments are "theorized experience" or "thought-after experience" (Fattori 2012). The compilation of natural and experimental histories is performed according to "learned experience," the art of proceeding from one experiment to another. The literate experience is seen by Bacon's commentators as either a method to order the material from natural histories into tables out of which axioms will be drawn (Jardine 1974), or as a help for the mind to generate natural histories and to keep under control the experimental variation of parameters (Jalobeanu 2015). There are several functions that experiments have in Bacon's natural histories, including but not limited to verification, illustration, and demonstration to concept-formation, exploration, classification, and modelling. Bacon himself divided experiments into two kinds: experiments of light (*experimenta lucifera*) and experiments of fruit (*experimenta fructifera*). The first are called of light because they are used to provide knowledge, while the second are called of fruit because they are oriented toward production. The natural and experimental histories compiled by Bacon have attracted scholarly attention due to the fact that they do not entirely follow Bacon's own guidelines. Instead of being collections of observations and experiments, they contain a great quantity of philosophy, which was supposed to be the next discipline in the hierarchy of knowledge. These histories contain not only observations and experimental reports, but also theories, explanations, advice to further experimentation, etc.

Philosophy of Nature

Bacon starts his analysis of natural philosophy by distinguishing it into speculative (also called natural science or theory) and operative (or natural prudence). Speculative natural philosophy seeks causes, while operative natural philosophy consists in the use of speculative knowledge for the production of effects: once we know the cause of a process, we can produce it artificially. Bacon followed Aristotle in considering that true knowledge is knowledge by causes; he also agreed on the existence of four causes: material, efficient, formal, and final. However, final causes are problematic for Bacon. In the *Novum organum*, Bacon says that they only relate to the actions of humans, and thus pursuing them only corrupts the progress of science. In the *De augmentis*, Bacon's attitude is slightly changed: final causes should be part of metaphysics, and not physics, because they constitute intentions and they presuppose a mind in nature.

Regarding speculative philosophy, Bacon first discriminates his approach from Aristotle's: if for Aristotle, the study of nature should start with individual bodies, for Bacon individuals are bundles of qualities, and the investigation should start with these qualities. They are pairs such as heat and cold, dense and rare, heavy and light, etc. These qualities, called by Bacon "schematisms" or "simple natures," can be known from the point of view of the three causes (material, efficient, and formal) and the type of cause is what further distinguishes between the disciplines of natural philosophy. The study of material and efficient cause pertains to physics. These causes are first variable, second dependent on matter, and third different for each individual that has the given quality. For example, fire is the cause of induration in clay, but the cause of melting in wax. The study of the formal cause is part of metaphysics. This cause, simply called "form" or "law," is common for all bodies that have this quality. The knowledge specific to metaphysics is thus more general and universal than the one of physics. For Bacon, natural knowledge is like a pyramid: natural and experimental histories constitute the basis of the pyramid, physics the middle because it investigates those causes that are variable and

dependent on matter, and metaphysics is the apex since it studies the universal and abstract causes.

Each of the two disciplines of speculative natural philosophy has an operative correspondent: mechanics uses the knowledge of physics in order to create effects, and natural magic applies that of metaphysics. Mechanics only imitates natural processes and translates the knowledge of physics to similar matter, that is, in cases that are very similar to those that lead to the discovery of the material and efficient causes. Because the knowledge of metaphysics is more general and goes deeper into the constitution of bodies, natural magic has greater power over nature, and it is capable of both fundamentally transforming existing natural bodies and creating new bodies that never existed before, in the sense of new species. In other words, once the form of several simple natures is known, it becomes possible to create new combinations of simple natures that never appeared in the course of nature: metals, animals, and plants different than the existing ones. Because of the unpopularity of magic and its connection to witchcraft and demonology (reflected also in Bacon's own criticisms, as we have seen), Bacon was at pains to distinguish his own conception of natural magic from the common use. For him, magic is the supreme knowledge of nature, which is used in transforming natural bodies. It does not include superstitions, witchcraft, or supernatural powers, but only a thorough knowledge of the laws of bodies (the forms) and the relations between them.

Mathematics has an auxiliary role for both speculative and operative natural philosophy. Bacon defines its subject as "quantity when applied to matter" and considers mathematics as one of the Essential Forms of things. Because at the same time it is the form most abstracted and separable from matter, its investigation should properly belong to Metaphysics, though all parts of natural philosophy could benefit from mathematical knowledge. Mathematics is pure and mixed. Pure mathematics, Geometry and Arithmetic, handles quantity "entirely severed from matter and from axioms of natural philosophy." Mixed mathematics, on the other hand, considers

quantity to such extent that it assists to explain, demonstrate, and actuate some axioms and parts of natural philosophy. Disciplines such as perspective, music, astronomy, cosmography, architecture, and machinery cannot have any inventions or demonstrations without the help of mathematics.

Inductive Method

The passage from natural history to metaphysics, that is, from sensible things to the forms of simple natures, is done with the Baconian method of induction. If *experientia literata* helps passing from one experiment to another, induction moves from experiments to axioms and back to experiments. Bacon offered two examples of how induction should work, one in the early unpublished *Valerius terminus* (1603), where he analyzes the form of white, and another in the *Novum organum*, where he analyzes the form of heat. Bacon's method starts by correcting the information provided by the senses, and then it orders experiences and experiments into tables of presence and absence. The table of presence gathers all the instances in which a simple nature is present and searches for another nature, which is always present with the first one. In contrast, the table of absence includes those instances where the nature under study is expected to be found, but it is not. The third and last table, the table of comparison, catalogs the variation of the degrees of presence and absence of the two natures, the one under study and the one discovered to be related to it – its form. This discovery of the relation between the simple nature and its form is an eliminative process and it is within it that we can find the only legitimate use of formal inference in the interpretation of nature (Jardine 1974). In the accumulation of instances of both presence and absence of the simple nature under study, and in ordering and comparing them, Bacon gives primary importance to what he calls “prerogative instances.” They are designed to help during the process of induction in various ways: they either give practical help in devising experiments by extending the power of senses, or suggesting technological benefit, or solve problems of procedure in the course of organizing the information.

Cosmology and Matter Theory

In parallel with his experimental programme, Bacon also developed a system of speculative philosophy, which can be found in both his early, unpublished works and the *Great Instauration*. Speculative philosophy was meant to remain provisory until verified through the process of induction, aspect which is also seen in the fact that some details are changed, which shows Bacon's willingness to adjust his ideas in accordance with the experimental results.

For Bacon, the way in which the bodies are situated in the universe, as well as the interaction between them, is based on the distinction between tangible and pneumatic matter. The tangible matter, dense, heavy, and inactive, is placed in the center of the earth, which coincides with the center of the universe; while the second, rare, light, and highly active occupies the rest of the universe, the sky of the fixed stars. There is a zone where the two interact, and this is placed on the surface of the Earth, more precisely, a few miles below the surface and a few miles up in the skies. The matter of the skies is of the same nature as the pneumatics from the zone of interactions, but purer than the sublunary one. Moreover, fire becomes stronger with distance from earth, while the air becomes weaker, so while in the sublunary world fire needs air as nourishment in order to survive, in the skies of fixed stars the fire is dominant and shines without the need of nourishment (see *Thema coelis*). The tangible matter from this zone of interaction cannot exist without pneumatics in it (even if those are air, the densest type of pneumatics), while pneumatics can be both free and attached to tangibles. However, pneumatic matter does not “want” to be imprisoned in the tangible one and thus tries to escape and unite with similar matter existing in the skies, causing thus the variety of processes we can observe. What Bacon considers to be the main natural processes (desiccation, liquefaction, maturation or concoction, putrefaction, and vivification), to which all the others can be reduced, result from this attempt of the pneumatics to escape the union with tangible matter.

Both tangible and pneumatic matters are separated into two “families” or “quaternia” of

things: sulfurous and mercurial. Sulfurous family is crude, watery, and noninflammable, while mercurial is concocted, oily, and inflammable. While the Paracelsian influence is obvious, Bacon transforms the Paracelsian theory in two significant points. First, Bacon changes the status of sulfur and mercury. If for Paracelsus they were spiritual principles out of which the material world was formed, for Bacon they are families of things. In other words, they distinguish all the things between inflammable (sulfurous) and non-inflammable (mercurial). Second, Bacon rejects salt from this distinction and for him salt is the union of sulfur and mercury, namely, any body, pneumatic or tangible, which is composed of both substances (Rees 1975).

Bacon’s cosmos, thus, is classified in accordance with the two aforementioned distinctions: between tangible and pneumatic and between sulfur and mercury. Taking into consideration their intermediaries, there are four types of matter. Tangible matter has two levels: at the subterranean level, it is distinguished into sulfur and mercury (the metals), and in the interaction zone, into oily and concocted substances on the one hand and crude and watery on the other. Pneumatic matter also has two levels: at the interaction, we find terrestrial fire and air, and in the skies of the fixed stars, sidereal fire and ether. These are the eight simple substances. As mentioned, for Bacon, salt is a composite of the two families, and these are, for the two sets of levels, just mentioned: subterranean salts, juices of plants and animals, attached animate and inanimate spirits, and the heaven of fixed stars.

The twelve types of matter then can be schematized in Table 1 below.

Individual bodies, as we can observe them, are composed of subterranean salts and spirits or juices of plants and animals and spirits. Spirits are a special kind of pneumatic matter, namely, a composite of fire and air, that is, of sulfur and mercury. However, there is further distinction between individuals, depending on the type of spirits they contain and the way in which they are distributed throughout the tangible parts. As it results from the *Historia vitae et mortis* and the *Sylva sylvarum*, metals and stones, which are inanimate beings, have “cut-off spirits,” this is spirits scattered in between their tangible parts. Plants and animals have two types of spirits: one is common with the inanimate beings (the cut-off spirits), but they also have a branched spirit, which is responsible for certain faculties, such as nourishment, growth, and generation. What is specific for animals is that this animate spirit has a main “cell” or “seat” in the body, the brain, that makes other faculties possible, such as the will, imagination, memory, and possible reason.

The activity of bodies, the interactions between and within bodies, is based on the interaction between tangible and pneumatic matter, but each of these types of matter has appetites that they want to satisfy. Appetites are desires impregnated in matter since its creation. The sympathy and antipathy things have between one another is the cause of appetites. There are three appetites of tangible matter: rest; motion toward what is alike; and the avoidance of void, of a contrary body, and of torture. The appetites of pneumatic

Bacon, Francis, Table 1 Structure of matter theory in Rees 1977

	Sulfur quaternion	Intermediates	Mercury quaternion
Tangible bodies (with attached spirits)	Sulfur (subterranean)	Salts (subterranean and inorganic beings)	Mercury (subterranean)
	Oil and oily inflammable substances (terrestrial)	Juices of animals and plants	Water and crude noninflammable substances (terrestrial)
Pneumatic substances	Terrestrial fire (sublunar)	“Attached” animate and inanimate spirits (in tangible bodies)	Air (sublunar)
	Sidereal fire (planetary matter)	Heaven of the fixed stars	Ether (planetary medium)

matter are of four types: of self-preservation, of bettering their condition, of propagation of their nature, and of enjoyment of their nature. These are more powerful than the appetites of tangible matter, producing more effects which are also more complex. In *Abecedarium novum naturae*, Bacon describes all these appetites and adds four simple motions for each of these appetites. The simple motions are actions through which the appetites work to gain supremacy against the other appetites, in this way satisfying themselves. Resistance, a simple motion of the appetite of self-preservation, is always invincible. Further, when in certain combinations, sequences, and quantities, these simple motions form the composed motions, or the visible processes we observe in nature, such as generation, growth, assimilation, or desiccation.

Individual bodies can also be analyzed as clusters of qualities; Bacon calls them schematisms or simple natures. These are always pairs of contraries, such as dense and rare, hot and cold, or heavy and light. The classification of schematisms is made according to five characteristics of either the tangible or the pneumatic matter which comprises individual bodies: the quantity of matter, the fluid and determinate parts, the proportion of spirits within a body, the inequality of its inanimate parts, the types of spirits, and the most profound schematisms (sulfur and mercury).

Bacon's matter theory and his general idea of a productive science was based on a consideration of matter as indefinite and as absolute potency. At this level of explanation, Bacon was influenced by the atomist theory, both in its ancient and modern versions. For Bacon, the atom is the material principle of all things. Primary matter has a form: its resistance to annihilation, which is at the same time its corporality, an appetite, and a motion. The world is the result of the emanation of the atom: the atom has a diffusive power, which creates the multiplicity of the world (Manzo 2006).

Philosophy of Man

Another branch of philosophy is the study of man. This can in turn be divided into philosophy

of humanity (which considers men as species) and civil philosophy (which considers men as members of society). The first, philosophy of humanity, studies the body and the soul of man. Logic and ethics are branches of the "Use and Objects of the Faculty of the Soul"; logic is concerned with the functioning of understanding, and ethics with the working of will, appetites, and affections. Ethics is further divided into Exemplar, or the Platform of Good, and Georgics, or Culture of the Mind. Bacon considers the latter deficient, because philosophers before him were not concerned with the practical improvement of conduct. Contrarily, for him, the main virtue of philosophers should be encountered in the active life. The public implication of philosophy is one of the main characteristics of philosophers. Science is a form of practicing the "common good" and it is superior to individual good, and active good is always greater than passive good. This leads Bacon to the conclusion, developed especially in the *Essays*, that what can be seen as immoral can actually be useful for the public use, and the other way around: what seems to be virtuous can be dangerous for the public good. For Bacon, rhetoric plays an important role in moral philosophy. It is fundamentally ethical, and it has a strong effect on human affairs. Rhetoric helps reason to apply to imagination and move the will in order to perform the good actions. Rhetoric and persuasion are needed because both reason and will are weak. This is why imagination plays a crucial role for Bacon – it censors the images of vices, selecting those of virtues and transforming them in vivid representations (Vickers 1968).

Philosophy of Divine

Bacon argued for a duality of truth: some truth can only be subject to divine revelation, while others can be acquired through philosophical investigation. They also correspond to the two books: the Bible and the nature. The first is the work of God's hands and the second is written by God's finger. Bacon discussed theology in *De augmentis scientiarum*, and he also wrote several theological treatises: *Meditationes Sacrae* (1597), *Prayers* (1603), *Translations of Certain Psalms into*

English (1624), and *A Confession of Faith* (published posthumously in 1641). But in a way Bacon's scientific project is based on theology: the aim of natural philosophy is to recover the state lost by the man after the Fall. Bacon was an orthodox Anglican and throughout his life he prosecuted both radical Protestants and Catholics.

Theology follows, according to Bacon, the same divisions as philosophy, according to the faculties of the human mind: Sacred history (including prophecy) corresponds to memory, Parables (which are a kind of divine poesy) correspond to imagination, and Doctrines and Precepts correspond to reason. Ecclesiastical history is part of civil history and is divided into History of the Church, History according to the prophecies, and History of divine judgements or providence. The last of these is supposed to observe the correspondence between God's revealed and secret will, in other words, between what serves to console the faithful and what serves to convince the wicked. Natural Theology or Divine Philosophy is a rudiment of "knowledge" about God, which is obtained by the light of nature and the contemplation of the creatures. This light is enough, according to Bacon, to refute atheism and provide information about the laws of nature, but not to establish religion. In order to convert idolaters and the superstitious, miracles are needed; but natural theology suffices to know that God exists, that he governs the world, that he is supremely powerful, wise and prescient, good, a rewarder, an avenger, and an object of adoration. Natural theology also makes it possible to attain knowledge about the nature of angels and spirits starting from corporeal things.

Legal Philosophy

Among his philosophical works, Bacon also composed a large amount of juridical treatises. Most of his life he was a practitioner who served in many legal roles: as advocate hired for certain trials, King's advocate, judge, and acted as vice-regent when the king was absent. Bacon is considered to have been the first analytical and critical jurist in the Anglo-American tradition and the first to apply an empirical and inductive analysis to

lawmaking (Coquillette 1992). Bacon emphasized the importance of the process, that is, the application of the substantive legal doctrines in practice, and the process through which the legal doctrines developed. Moreover, he developed a method that can be applied to jurisprudence. Instead of having a corpus of substantive doctrine, he established "methods of compiling, reforming, interpreting and using law" (Coquillette 1992). Because of the abundance of reported cases, Bacon argued for a systematic and critical digest of case reports. He was against torture, but also against fictions and legal distinctions. Similar to the way in which he considered that natural philosophy should be digested into maxims, he thought that the legal information should be preserved and diffused in the same form.

Impact and Legacy

In the seventeenth century, Francis Bacon was seen as the apologist for science and the authority of experimental science. In the second half of the century, Bacon became the emblematic figure of the new scientific societies across Europe, such as Accademia della Scienza (Florence), Académie des Sciences (Paris), and the Royal Society. However, it is still a matter of debate how much his own speculative ideas and the proper method of investigating nature influenced the following generations of natural philosophers.

Bacon's influence in France was immediate. Since the early 1620s, Bacon was famous for his reformation of knowledge within the intellectual circle formed around the brothers Dupuy. Moreover, Descartes characterizes Bacon's method as the legitimate complement of his own approach. Marin Mersenne stresses Bacon's criticism of scholastic philosophy as important, even though he does not give much importance to Bacon's inductive method or to his experimental practices. Nicolas Malebranche holds a similar attitude, while Pierre Gassendi is more critical, arguing that the method of induction is unable to prove anything. In the Netherlands, Bacon's works were read and discussed by Constantijn Huygens

and Isaac Beeckman, while other important figures in diffusing Bacon's works were the brothers Gruter: Isaac Gruter published a few manuscripts inherited from William Boswell (Bacon's brother-in-law) and Jacob Gruter translated *Sylva sylvarum* in Latin.

The situation was different in England. Baconian philosophy became popular during the Interregnum. Bacon's idea of improving human nature and human life with the help of natural philosophy was very widespread among the members of the Hartlib Circle, and it coincided with their protestant views on salvation. Bacon's advice for gathering natural histories was seen by most circle members as an egalitarian approach, something mirrored in Jan Amos Comenius' educational reform. The natural historical approach was followed in practice by Ralph Austen, John Evelyn, and William Petty. While it is difficult to find what is common for all Bacon's followers, some characteristics seem to identify them as Baconians: being in favor of *negotium* instead of *otium*; having an experimental, natural-historical, and inductive approach to natural science; institutionalization of natural philosophy and means to communicate knowledge; cooperative research; as well as a utilitarian and technological approach to social issues. Their identity as Baconians was also evident in the things they were opposed to: useless erudition, metaphysical speculation, superstition, theological controvert, improper reliance on unaided reason, as well as Aristotelianism and scholasticism (Rees 2002).

With the restoration of the monarchy in 1660 and the establishment of the Royal Society, the Baconian scientific project becomes the preeminent vision of British natural philosophy. The Royal Society is the materialization of Solomon's House in the *New Atlantis*. But more than this, the aims of the society coincided with those of Bacon's *Instauratio Magna*: scientific progress attained through experimentation and examination of particulars, collaboration, and technological control over nature. The influence of Bacon's induction over the most representative exponents of the Royal Society, such as Robert Hooke, Robert Boyle, and Isaac Newton, is still a matter

of debate. Hooke was invested into collecting particulars; Boyle made use of the crucial experiment, a transformation of the crucial instance (*instantia crucis*) from the *Novum organum*; and Newton, though not mentioning Bacon even once, adopted the collection of particulars, the induction, and the crucial experiment as parts of his science. It is however disputable to what extent Bacon's speculative ideas were adopted by his followers. One can argue for example that Boyle's concept of "texture" holds a close resemblance to Bacon's idea of the "form of a simple nature." However, it could be that the oblivion of Baconian speculative ideas is the result, on the one hand, of its resembles, at the language level, with the Aristotelian substantial form, so much rejected by early modern natural philosophers, and, on the other, of his vitalist and Paracelsian conception of nature, rejected by most of the corpuscularian mechanist philosophers.

During the Enlightenment, Bacon is again seen as the revolutionary figure of philosophy. It is the humanitarian value of his technological exploitable science used to satisfy the need of the society that made Bacon significant for authors such as Jean le Rond D'Alembert, Denis Diderot, Nicolas de Condorcet, or Jean Jacques Rousseau (Pérez-Ramos 1996). Yet another interpretation of his contribution to science is given by the nineteenth-century Victorian philosophers, such as John Herschel, William Whewell, and John Stuart Mill. For these philosophers, the accent of induction is on the process of mapping out the process taking place in the mind of the practitioner while performing the scientific research. It is nevertheless debatable how much their concept of induction coincided with the Baconian idea exposed in the *Novum organum*. Bacon's fame started to fade toward the end of the nineteenth century, with the fierce criticisms of authors like David Brewster, Justus von Liebig, or G.H. Lewes. For Thomas Kuhn, the Baconian approach was a pre-paradigmatic one, to be developed only in the late seventeenth century and Bacon was the proponent of an experimentation style design to investigate how nature behaves under previously nonexistent circumstances.

Kuhn's commentators did not focus on Bacon, since their emphasis was on the paradigmatic figures, but this started to change in the last decades of the twentieth and early twenty-first centuries.

Abstract

The philosophy of Francis Bacon was interpreted in various ways in the seventeenth century. In England, his utopian project and natural history became the basis for the projects of religious pacification, pedagogical reformation, and scientific cooperation of Hartlib, Comenius and Charleton. In the hands of Evelyn, Wilkins, and Wren, moreover, Bacon's ideal of cooperative science engendered the birth of the Royal Society, and his natural history guided the experimental activities of Boyle and Hooke. In France and the Netherlands, attention was paid to Bacon's natural history especially within the circle of friends of Descartes. In the second half of the seventeenth century, though Bacon's historical approach was gradually supplanted by mechanical-mathematical science in Europe, Baconianism still served as a source of arguments in the Dutch Cartesian context, as to his theory of error and as a source of criticisms to Aristotelianism.

Innovative and Original Aspects

The reception of Bacon's philosophy was manifold, as one can distinguish between political, utopian, experimental, and metaphysical Baconianisms (Giglioni 2012). In England, the appropriation of Bacon's philosophy had a relevant social and religious character. For Samuel Hartlib and Jan Amos Comenius, Bacon's program of renovation of philosophy served as the basis for a

religious pacification of society based on scientific learning and on improvement of techniques as husbandry and mining. Such learning would have been made possible by the application of Bacon's natural history and substantiated in a pansophical collection of all knowledge (Bacon 1857a, b, c, 2000; Hartlib 1970). On a metaphysical level, Comenius and Francis Glisson endorsed Bacon's theory of matter as provided with life and appetites (Comenius 1668; Glisson 1672; Giglioni 2010, 2012). Moreover, Bacon's program of establishing a community of scientists ("Salomon's House") and his natural history were the basis of the pedagogical reform of Walter Charleton for the College of Physicians in London, a group of virtuosi aimed at the exchange of learning, active in 1650s (Charleton 1657; Jalobeanu 2009). Eventually, Baconianism engendered the foundation of the Royal Society: according to the official history of the early Royal Society by Thomas Sprat (Sprat 1667), Baconianism inspired the activities of the "Oxford group" of natural philosophers, including John Evelyn, John Wilkins, and Christopher Wren, who assumed a "pure" form of Baconianism, i.e., they relied on Bacon's inductive method and theory of error (Bacon 2004a), opposed to the "vulgar" Baconianism of Hartlib and the London group (Purver 1967). This account has been corrected in more recent years, as also this group was largely relying on the Baconian ideal of a cooperative science and natural history (Hunter 1981; Agassi 2013; Gaukroger 2001; Jalobeanu 2009, 2015). Also, Bacon's natural history influenced the experimental philosophy of Robert Boyle and Robert Hooke, using the Baconian distinctions between luciferous, fructiferous, solitary and in consort experiments, and the notion of crucial experiment (Boyle 1665; Hooke 1679, 1705; Bacon 1996a, b, 2004b, 2007; Anstey 2014). Moreover, Baconianism inspired the failed attempt of Sprat, Joseph Glanvill, and Abraham Cowley of establishing a College for the Society modelled on the "Salomon's House" in 1660s (Hunter 1984).

In France, Nicolas Fabri de Peiresc planned to translate Bacon's natural histories, and Pierre Amboise abridged Bacon's *Sylva Sylvarum* by the technique of commonplacing (Yeo 2007; Jalobeanu 2014). Moreover, Marin Mersenne

developed an interest for Bacon's natural history after having first rejected his empirical method as atheist and skeptical. Under the influence of Descartes, who asked him empirical data for the study of meteorology, Mersenne deepened Bacon's historical study of sound (Mersenne 1648; Buccolini 2013). In the Netherlands, Bacon's natural history was commented by Isaac Beeckman in his *Journal*, though he criticized Bacon's relying on the qualitative properties of matter rather than on mechanism and mathematics (Beeckman 1939–1954; Gemelli 2013, 2014). With the emergence of Dutch Cartesianism in 1650s, Bacon's philosophy offered a theory of error and an account of past philosophical theories which served to criticize the Scholastic approach to science, as by Johannes de Raey and Burchard de Volder. Also, it served as a *medicina mentis* in the introduction of students to philosophy, as in the works of Johannes Clauberg and Arnout Geulincx (Clauberg 1691; Bacon 1996c, 2004a; Geulincx 1891; De Raey 1654; De Volder 1681; Elena 1991; Strazzoni 2012). Eventually, the emergence of a mathematical natural philosophy expounded by the Newtonians supplanted Baconianism in European science (Anstey 2015).

Bagolino, Gerolamo

Born: End of the Fifteenth Century, Verona

Died: Around 1540

Coralba Colomba

Department of Humanities, Università del Salento, Lecce, Italy

Abstract

Gerolamo Bagolino, a physician and a professor of philosophy at the University of Padua, is best known as a translator of works by Aristotle and his commentators (Johannes Philoponus, Alexander of Aphrodisias, Syrianus, Averroes). As a pupil of Nicoletto Vernia, he taught at Padua and Bologna and collaborated on the great edition of Aristotle's works and their Averroes commentaries that were published in Venice in 1522.

Biography

Bagolino was born in Verona in the last decades of the fifteenth century. He studied in Padua where he became Doctor in Artibus in 1494 and received his doctorate in medicine on 1 February 1501

(Padova, Archivio della Curia Vescovile, vol. 46, f. 146 v) (Nardi 1958; Lohr 1988). Nevertheless, he dedicated himself to philosophy and became professor in 1517 (Sanuto 1889). He held, subsequently, the chair of Ordinary Philosophy (1520), Ordinary Practice (1522), and then Extraordinary Practice (1524) (Mazzuchelli 1758; Vasoli 1963; Lohr 1988). In 1525 he returned to Verona. He also taught logic in Bologna, where he was the teacher of Francesco Burana, with whom he would continue to collaborate.

Bagolino adheres to the so-called school of Paduan Aristotelianism. He primarily produced an intense work of translation and commentary of the works of Aristotle and of Aristotle's commentators (Johannes Philoponus, Alexander of Aphrodisias, Syrianus, Averroes) together with his son Giambattista and in collaboration with his pupil Francesco Burana. He also contributed to the great edition of Aristotle with the commentaries of Averroes, published by his son after his death in 1552. It is suspected that in this edition plagiarism occurred through the unattributed use of Nicoletto Vernia's commentaries, which were never published in spite of their author's intention. Bagolino had access to these by virtue of his close relationship with Vernia. Bagolino, in fact, was Vernia's student and close collaborator and together with Agostino Del Ben was allowed to edit his unpublished writings on Aristotle's work (Garin 1947; De Bellis 2012).

Bagolino thus translated the *De fato* by Alexander of Aphrodisias (*Fato de que eo quod in nostra potestate est ex mente Aristotelis Liber eximius Alexandri Aphrodisiensis, latine vertit Hieronymus Bagolinus*, Veronae 1516, then Venetiis 1541, 1549, 1555, 1559), the commentary to *De generatione et corruptione* of Philoponus (*In Aristotelis libros duo de Generatione et Corruptione commentariis Ioannis Philoponi, Hieronymo Bagolino interprete*, Venetiis 1540, poi 1543, 1548, 1549, 1558, 1559, 1588; in 2004 Frans A.J. de Haas published a copy of the edition issued in 1558 in Venice by Girolamo Scoto), and the commentary to Syrianus' Aristotelian Metaphysics (*Commentarii Syriani in Lib. II, XIII, XIV Metaphysicorum Aristotelis ex interpretatione Hieronymi Bagolini*, Venetiis 1558).

To Bagolino are ascribed some *Annotationes in Averrois compendium in Analytica Priora* published within his protégé Burana's main work (Riccoboni 1598; Lohr 1988) (*Aristotelis Priora Resolutoria latino sermone donata et commentariis illustrata a Io. Francisco Burana, adjecta Averrois expositione Secundi Secti de facultate propositionum, et Averrois in eodem compendio, eodem Burana interprete cum annotationibus Hieronymi Bagolini*, Venetiis 1524, 1536, later Lutetiae Paris 1539 and Venetiis 1567). He was also the author of some *Quaestiones naturales et morales et de fato l. IV Alexandri Aphrodisiensis. Latine vertit Hieronymus Bagolinus Veronensis*, Venetiis 1541, 1544, 1546, 1549, 1555, 1559, 1563.

Moreover, we know that there is an unpublished *Collectanea in libros Priorum* and another unpublished work *In libros I et II Posteriorum Analyticorum* (Mazzuchelli 1758; Lohr 1988). The edition of Aristotle and Averroes (*Aristotelis opera omnia Commentariis Averrois notis Levi Gersonidis, Iacobi Mantuani, Marci Antonii Zimarae et Ioannis Baptistae Bagolini*) was printed in Venice in 1552 by Giunti.

Baldi, Bernardino

Born: 6 June 1553, Urbino

Died: 10 October 1617, Urbino

Elio Nenci

University of Milan, Milan, Italy

Abstract

A man of letters, historiographer, linguist, mathematician, and architectural historian, Bernardino Baldi may be regarded as a classic embodiment of the all-round Renaissance man. He has left his mark practically in all the fields in which he operated. He was the first modern historiographer of the mathematical sciences. Until this day, his translations of certain technical texts from antiquity, like his lexicographical work on Vitruvius, represent a valuable starting point for further enquiries. Most interesting of all are his insights in the field of mechanics, as Baldi often appears to foreshadow some of the theoretical perspectives that inform Galileo's later investigations into the strength of materials.

Biography

Baldi received his education in Urbino. Here, he first learned the classical languages and then embarked on the study of the mathematical sciences under the guidance of his fellow citizen Federico Commandino, who for many years had been working on the publication of the most important mathematical works in Latin translations. Between 1573 and 1575, Baldi moved to Padua to study medicine, but ended up regularly attending Philosophy and Classics lectures instead (Serrai 2002). He also attended the Mathematics course held by Pietro Catena, but ultimately found it disappointing (Baldi 1707).

Just after Commandino's death in 1575, Baldi started gathering information about his teacher's life. Soon, he resolved to do the same for all mathematicians from Antiquity to his own day.

In the following decade, Baldi drew upon this considerable material to compose his *Vite de' Matematici* (*Lives of Mathematicians*), a collection of around 200 biographies, still largely unpublished (Baldi 1998). Meanwhile, he continued his studies under mathematician Guidobaldo del Monte of Pesaro. In 1580, Baldi entered the small court of Guastalla as mathematician to Prince Ferrante II Gonzaga. His most important work from this period is the Italian translation of Hero's *Automata*, which was revised and published many years later with an interesting introduction (Baldi 1589).

During his first years in Guastalla, Baldi composed many literary works, most notably *La nautica*, a didascallic poem much appreciated even today. Also dating from this period is his in-depth study of Vitruvius' *De architectura*, which led to the drafting of two major works: a Virtuvian lexicon (Baldi 1612a) and a study focusing on a difficult passage from the Roman architect's treatise (Baldi 1612b).

In 1586, Baldi's life changed radically. When Ferrante II had the church in Guastalla raised to the status of abbey, the mathematician was appointed as its first abbot. Henceforth, Baldi's interests increasingly shifted from scientific topics to the study of eastern languages and theological subjects; but although he no longer regularly devoted himself to mathematics, on several occasion he had the opportunity to pursue studies related to this discipline: for example, in 1592 he completed a major work on gnomonics. The manuscript containing this work, which had long been thought lost, is now in the History of Science Collections of the University of Oklahoma.

In 1596, Baldi visited Rome, where he stayed until the early months of 1598 as a guest of Cardinal Cintio Aldobrandini. Here he met Giovan Battista Raimondi, a fair mathematician with an excellent knowledge of eastern languages who guided him in the study of Arab (Affò 1783).

In the early 1600s, Baldi sought to publish his literary works, but only some of them went to print, in Pavia and Parma. In the meantime, Baldi had become close to the Duke of Urbino, Francesco Maria II, who had entrusted him with composing a life of Federico da Montefeltro. The

favor that Baldi enjoyed with the Duke led him to quit his office as the Abbot of Guastalla and to return to Urbino in 1609.

A few years later, some of Baldi's works, including those on *Virtuvius*, were printed in Augsburg thanks to the support of Marcus Welser, a member of the Accademia dei Lincei. A Latin translation of Hero's *Belopoeeca* was also published in the German city in the author's lifetime (Baldi 1616). In these last years of his life, Baldi wrote a biography of Federico da Montefeltro's successor, the Duke of Urbino Guidobaldo I, and then fully devoted himself to the creation of a huge geographical dictionary, which remained unfinished.

Four years after Baldi's death, in 1621, his most important scientific work was published in Mainz: the *Exercitationes* on the pseudo-Aristotelian *Mechanical Problems* (Baldi 2011). Through a systematic application of Archimedean centrobarics, it significantly contributed to the development of modern mechanics by offering the first scientific study of the strength of materials and of the causes of the stability/instability of beams, trusses, and arches (Becchi 2004).

Ballistics in Renaissance Science

Patrick Brugh

Loyola University of Maryland, Baltimore, MD, USA

Abstract

This entry discusses the historical legacy in innovations of ballistics as they relate to warfare in Europe between 1300 and 1700. It primarily deals with the problems of smoothbore gunpowder weapons (both artillery and small arms) and the ways in which commanders and artillerymen adjusted their strategies and tactics to account for the limitations of accuracy and unreliability of these weapons. Also discussed are modern comparative studies of early modern gunpowder small arms and early modern scientific and mathematical studies of the trajectory of gunpowder weapons.

Definition of Ballistics and Importance for Early Modern Warfare

Ballistics is the study of the flight of projectiles, most frequently associated with the flight of missile weapons, artillery ordinance, and bullets. The bulk of our knowledge about the ballistic properties of early modern arms comes from historical resources such as battlefield reports and military treatises of the early modern period, eighteenth- and nineteenth-century tests of artillery, and some contemporary recreations using both manufactured reproductions and original artifacts. In particular, thanks to debate surrounding the impact of gunpowder warfare on European

society, modern scholars have looked closely at the physics of smoothbore weaponry. Among the challenges to study accurately the ballistics of early modern weapons are the unreliability and lack of technical detail in early modern and late medieval sources, the impossibility of reproducing battlefield conditions, and the chemical and metallurgical differences between weapons and combustibles with different geographical and historical origins. Strictly speaking, the majority of scientific knowledge about ballistics was created centuries after the more practical considerations of warfare brought weapons such as guns, catapults, and crossbows to the battlefield.

Heritage and Rupture with Tradition: Vegetius's Legacy in the Age of Gunpowder Weapons

The bulk of the written record of ballistic studies in the middle ages stems from interactions with the military treatise *De re militari* by Flavius Vegetius Renatus (fl. fourth century C.E.), more commonly known as Vegetius. Vegetius's work was heavily translated and summarized by early modern military theorists, among others by Christine de Pizan in her *Fais d'armes et de chevalerie* (ca. 1410), Conrad Kyeser's *Bellifortis* (ca. 1405), and even later Leonhard Fronsperger in his *Kriegsbuch* (1573). Vegetius's mark on medieval and early modern siegecraft and preparations for war should not be understated, since even today some 150 manuscripts of his *De re militari* dating from the tenth to fifteenth centuries survive in various languages. Although his text was written centuries before the advent of gunpowder warfare, its recommendations are passed along almost unchallenged save the addition of cannons and gunpowder to the list of materials needed for war next to trebuchets, mantelets, and other siege machines. Gunpowder weapons, therefore, became another – increasingly important – tool in the military commander's kit of ballistic weaponry. Due to the early ineffectiveness, burden, and unreliability of gunpowder weapons to make decisive victories in all but a handful of military conflicts, versions of Roman missile weapons, of which many were passed

down by Vegetius, remained an operative part of the manuals of war written well into the sixteenth and early seventeenth centuries.

Innovative and Original Aspects: Smoothbore Ballistics and Early Modern Theories of Ballistic Flight

The Magnus effect (1852) and Bernoulli's principle (1738) have helped to explain the inaccuracy of smoothbore ballistics in retrospect, but the operators of early modern firearms were more interested in developing battlefield tactics for overcoming these shortfalls than explaining them. Since smoothbore weapons fired rounded shot from unrifled gun barrels, slight imperfections in the shot or the barrel could send the shot spinning on an axis, giving it unpredictable angular momentum. The effect of this spin, as explained by Gustav Magnus and discovered in experiments recorded by Benjamin Robins in his *New Principles of Gunnery* (1742), resulted in deviations from several inches to several feet from the original target depending on its distance. Since musketballs (and cannonballs) could miss a target by a wide margin when mounted on a fixed position and fired under ideal conditions, it is not hard to imagine how far flung a bullet could fly in the havoc of battle.

Some early modern mathematicians and scientists, in particular Niccolò Fontana Tartaglia (d. 1557) in his work *Nova scientia* (1537), did try to deal with the mechanics of trajectory and distance, by applying different forms of reasoning such as geometrical, Archimedean, and algebraic approaches to the trajectory of ballistical objects. Tartaglia's goal, as he states in the opening of his work, was to solve the "bombardier's challenge" and determine the proper angle of a shot to create the maximum range of a cannon. Despite the fact that he claimed to pull from both observed and theoretical physics and geometry, Tartaglia's work does not account for the parabolic motion of a fired object, a mechanical fact that he would have encountered in Archimedes' *Quadrature of the Parabola* (third century B.C.), which he seems to have read and whose writer he cites as central to his own work (Ekholm 2010: 196). Based on his

ideal cannon angle of 45 degrees, his diagrams depict an object flying upward at a 45-degree angle in a straight line, then making a slightly circular descent, and finally falling again to earth in a perfectly straight line perpendicular to the ground. Tartaglia's patchwork method of calculating the maximum distance of a shot had little grounding in the actual mechanics or practical application of ballistics, but it did arrive at a moment in which the debate over the relationship between natural science and theoretical mathematical proofs was beginning to shape the development of renaissance scientific method in the Aristotelian traditions.

It would be another century before Galileo published his dialogues on *Two New Sciences* (1638), which would address the motion of projectiles, in particular those launched from firearms. In contrast to his scientific worldview, Galileo depicted the force behind firearms as "supernatural" and thus deserving of a differentiated approach from other projectiles. One consequence of "the enormous momentum of these violent shots" from firearms helps to explain the straight trajectory that Tartaglia had assumed a century earlier, because, as Galileo points out in "The Motion of Projectiles, Theorem I, Proposition I," the "beginning of the parabola" may be flatter and less curved than at the end, but "this is a matter of small consequence in practical operations, the main one of which is the preparation of a table of ranges for shots of high elevation, giving the distance attained by the ball as a function of the angle of elevation" (Galileo 1638). Perhaps notably above, and found also in his many other caveats placed throughout the dialogue in which he considers the flight of projectiles, Galileo points out that the number of factors that could affect the accuracy and speed of a cannon shot in real life are beyond his ability to calculate abstractly. More useful to the bombardier, it seemed, are tables that carefully lay out charge weights, shot weights, firing angles, and distances for consideration in practical matters of war.

Galileo was not alone in believing that practice with firearms seemed to be an important element in gunpowder warfare. Even though Tartaglia and Galileo had tried to reason the theoretical trajectories of cannonballs, and others such as Ufano,

Pizan, and Fronsperger had compiled and recorded tables and practical lessons for consideration, the operator of small arms and artillery alike had to be aware that technical limitations and a lack of standardization made practice with the actual equipment a necessary part of military training. The weapons manufacturer, meanwhile, should strive to increase standardization in order to render firing outcomes more predictable. From England to Sweden to the Hapsburg and Ottoman Empires, firearms manufacturers did indeed begin standardizing their weaponry in the sixteenth and seventeenth centuries. Nations also slowly began to standardize their militaries to account for gunpowder ballistics. At the end of the sixteenth century, in fact, around the same time that Galileo was teaching the concepts of physics that he would later commit to writing in the *Two New Sciences*, the idea of drilling soldiers with their weapons in very careful and exact ways was innovated by Maurice of Orange and illustrated in a bound series of images by Jacob de Gheyn. Whether firing a pistol or a gigantic bombard, the soldier on the battlefield needed to marry technical knowledge and disciplined movements to Galileo's scientific theory to overcome the number of complicating physical, psychological, strategic, and technical factors that could impact the ballistical function of his guns.

SMALL ARMS: Modern efforts to understand the ballistics of smoothbore small arms on the battlefields of Europe from the 1400s to 1700s turn to three questions with an eye to gunpowder weaponry – "How fast did the bullets travel? How accurate was smoothbore gunfire? And how much damage did such bullets inflict on their target?" (Hall 1997: 135). In terms of speed, historical comparisons of modern shoulder and side arms show that bullets fired from early modern weapons have supersonic muzzle velocities about half that of modern assault rifles but faster than most standard modern handguns. As discussed above, the accuracy of these weapons was typically poor, despite the fact that gun makers as early as the fifteenth century were familiar with the idea of rifling, a trick of physics that they had learned from the fletchers of arrows. Although it (sometimes) led to greater accuracy, rifling was not typically added to battlefield

firearms because it reduced the rate of fire and became easily clogged with gunpowder residue. Thus, a shot fired from typical musket or handgun could easily miss its target by several feet. Modern tests of smoothbore weapons have shown that there was a 50–50 chance of hitting a man-sized target at 100 m under ideal conditions. Finally, tests conducted in Austria in the late 1980s using period weapons and armor showed that smoothbore small arms created wound cavities at a short range that were two to three times larger than wound cavities made by modern assault weapons. When used against 3 mm plate armor at a distance of 8.5–9 m, the bullets would fragment, badly wounding or at least seriously bruising the target, but not inflicting immediately mortal damage. Taken together, these results showed that typical early modern European guns were tremendously dangerous at a short range, but quickly lost their effectiveness both in accuracy and inflicted damage at greater distances.

ARTILLERY: Cannons were first used as siege weapons, another kind of catapult to besiege towns and knock down walls. In fifteenth-century military treatises and fictional war literature, which drew heavily on Vegetius, such as Heinrich Wittenwiler's *Der Ring* (ca. 1410), cannons and trebuchets were given similar importance in terms of their means of delivering blows to a target. The earliest bombard cannons of the fourteenth century were little more than massive metal tubes stuffed with gunpowder and huge stones to be flung in the general direction of a defensive walls, fortifications, and towers. Accuracy was of less importance than force. Through the 1300s, these weapons were also incredibly difficult to transport, and thus to place, and therefore were of little use to field tactics. Only under the leadership of Jan Zizka, the Hussite Rebels of the 1420s demonstrated the potential value of gunpowder weapons in field warfare by using medium to large caliber *Wagenburg*-mounted artillery to fire on charging knights and infantry. Even when artillery grew more mobile and accurate in the fifteenth and sixteenth centuries, the value of cannons for siege warfare was the ability to constantly barrage a large target area with the general idea of inflicting damage. As with small

arms, field artillery's inaccuracy required high rates of fire and oblique angles to the targets, which had to be slow and large, such as massed formations of marching men. There is significant evidence in European war treatises of the fifteenth, sixteenth, and seventeenth centuries that artillerists were constantly experimenting with angles of attack and defense, the weight and composition of gunpowder charges, design of the ordinance, and the tools used to determine distance of targets in order to add some degree of accuracy to a relatively inaccurate ballistic tool.

Impact and Legacy

Thanks to the inaccuracy and unreliability of early modern firearms, tacticians and commanders of the sixteenth and seventeenth (even eighteenth) centuries took a stochastic approach to gunpowder weapons for both the infantry and artillery. Infantry and heavy cavalry units, especially in the late 1500s, developed tactics and drills like the countermarch, the *caraçol*, and weapons drill that sought to sustain high rates of fire on the battlefield in order to increase the chances of hitting targets. Thus, soldiers were grouped carefully together in rows that could fire past each other, were trained to mechanize their movements to improve efficiency, and were deployed to maximize the surface area of the target. Gunpowder artillery was also used widely from the late fourteenth century on but required continuous technical and tactical tinkering to make it more effective both in siege, field, and sea warfare. By the mid-sixteenth century, artillery established itself as a necessary division of all large-scale armies, and the challenges of smoothbore gunpowder ballistics had become mandatory considerations in the training and deployment of both infantry and cavalry units.

Balthasar de Ayala

Born: Antwerp, 1548

Died: Aalst, 1584

D. L. Dusenbury
De Wulf-Mansion Centre, Institute of Philosophy,
Catholic University of Leuven, Leuven, Belgium
Philosophy Department, Loyola University
Maryland, Baltimore, USA

Abstract

Balthasar de Ayala attended the University of Louvain and later served as advocate-general of the army of King Philip II in the Netherlands. He finished his only book, *De iure et officiis bellicis et disciplina militari*, in 1581, and died of unknown causes in 1584, at the age of 36. Ayala's treatise reflects the intellectual culture of Louvain, in which both scholastic and humanist jurisprudence were practiced. The work is influenced by Jean Bodin, but Ayala theorizes the Bodinian state within the higher unity of the Holy Roman Empire. With four editions, Ayala's work served jurists and canonists as an authority on the laws of war throughout the seventeenth and eighteenth centuries. Ayala's contemporary relevance

centers upon his strict application of a formal criterion of belligerency. Without abandoning a moral conception of "just war" (*bellum iustum*), Ayala insists that only a sovereign state can engage in hostilities as a "just enemy" (*iustus hostis*). Insurgents are to be treated as outlaws.

Alternate Names

Ayala, Balthasar; Ayala, Balthazar; d'Ayala, Balthasar; d'Ayala, Balthazar; de Ayala, Balthazar

Biography

Balthasar de Ayala was born in 1548 in Antwerp. His mother, Agnès de Renialme, belonged to the Hispano-Flemish nobility. His father, Diego de Ayala – a native of Burgos, Spain – was a citizen of Antwerp and a prosperous merchant. Nothing is known of his childhood. At the age of 17, Ayala matriculated in the Faculty of Law at the University of Louvain. His inscription is dated 17 August 1565. There is no further record of his time in Louvain, and it is not known when he became a licentiate in the laws (*licentiatius iuris*). It is likely, however, that his period in Louvain roughly coincided with that of Cornelius Grotius, later professor of law at the University of Leiden and uncle of Hugo Grotius. Ayala's parents died in 1579 and were buried in Antwerp. In May 1580, at the age of 32, he was appointed advocate-general of the army of King Philip II in the Netherlands. This made him the highest military judge in the counterinsurgency apparatus of Alexander Farnese, the Duke of Parma, who then held concurrently the offices of governor-general and captain-general of the Netherlands. In August 1580, two military prosecutors and an executioner were added to Ayala's personal retinue.

In 1581, during Farnese's siege of the rebel-held city of Tournai, Ayala finished his only published work, *On the Law of War, and on the Duties Connected with War, and on Military Discipline* (*De iure et officiis bellicis et disciplina militari*). The book's dedication – to Farnese – is

dated 31 October 1581 and signed in “the camp before Tournai.” It appeared in 1582 with a printing house at Douay.

In January 1583, Farnese appointed Ayala to the highest court in the Netherlands, the Great Council of Mechelen (then in exile at Namur). Even after this appointment, he remained in the field with Farnese and the army of Philip II. Ayala died in Aalst on 1 September 1584, of unknown causes, at the age of 36. He was survived by a natural daughter, Barbara de Ayala, who later married Hendrik Zoes, a professor of law at the University of Louvain and author of commentaries on civil and canon law.

A letter from the Flemish humanist Justus Lipsius to one of Ayala’s brothers suggests, intriguingly, that Balthasar de Ayala may also have written a treatise *On Peace* (*De pace*). There is no extant copy of such a text, however, and no record of its publication (Rivier 1883).

Heritage and Rupture with the Tradition

Ayala’s treatise reflects the intellectual culture of Louvain in the mid-sixteenth century. A scholastic influence seems to have predominated, but Gabriel van der Muyden and Jacob Reyvaert had introduced humanist jurisprudence in the decades before his arrival as a student (Lesaffer 2009). Both styles of jurisprudence shape Ayala’s legal reasoning in *On the Law of War, and on the Duties Connected with War, and on Military Discipline*.

Ayala’s text is replete with classical citations, the most numerous being of Livy, Valerius Maximus, Plutarch, Tacitus, Appian, and, above all, Cicero. Augustine of Hippo is his special patristic authority. The corpora of Roman law – civil and canon – are comprehensively referenced. Ayala’s knowledge of the glossators seems to be thorough. Of the medieval scholastics, he favors Thomas Aquinas. Of the Renaissance scholastics, he draws most explicitly from Domingo de Soto and Diego de Covarrubias y Leyva, both of whom took part in the Council of Trent.

A less visible influence is that of a Piedmontese legist, Pierino Belli, whose *Treatise on Military Matters and Warfare* (*De re militari et bello*

tractatus, 1563) is a clear precursor to Ayala’s. Despite the fact that Ayala seems virtually to have had Belli’s *Treatise* laid out “in front of him when composing his own work” (Knight 1921, p. 222), he only cites Belli twice.

The sixteenth century’s monarchomachs provide a critical impetus to Ayala, who is committed to stemming the tide of anti-monarchical and anti-imperial militancy in Europe. Yet he limits his direct engagement to a marginal note citing the *Francogallia* of François Hotman. Ayala accepts a severely circumscribed right to kill “tyrants,” but Hotman’s broad legitimation is dismissed as “wicked and absurd” and as “subversive of the republic.”

Ayala’s conception of a “republic” signals the pervasive influence of Jean Bodin. Ayala tends to cite Bodin approvingly and, crucially, follows him on the question of sovereign powers. What is most striking is that Ayala situates the Bodinian republic within the higher inalterable unity of a *res publica christiana*, that is, the Holy Roman Empire (Peralta 1964). Ayala theorizes the Renaissance state within a legitimate continental order and not within a “state of nature.”

Impact and Legacy

Ayala’s treatise enjoyed a “vogue in its day” (Knight 1921, p. 221) and saw four editions before 1800, with the last appearing in Madrid in 1793. Commentaries and commonplace books show that it served jurists as an authority throughout the seventeenth and eighteenth centuries (Bechtoldus 1654; González Téllez 1715). Of particular interest is a critical engagement by the Jesuit master-thinker, Francisco Suárez (Schnepf 2003).

In *The Rights of War and Peace* (*De jure belli ac pacis libri tres*, 1625), Hugo Grotius cites Ayala more than once as an authority on his topic. The study of Ayala in the late nineteenth century is largely due to this commendation (Nys 1882; Rivier 1883). So is the 1912 reissue of Ayala’s treatise – in facsimile and in English translation – by the Carnegie Institution of Washington.

In recent decades, historians have “attributed to Ayala a higher rank and influence which [is] not exclusively based in Grotius’ judgment” (Grewe 2000, p. 207). The most notable is Carl Schmitt, for whom Ayala signals a new epoch in European legal history by stating with singular clarity the modern “concept of the enemy.” For Schmitt, Ayala’s doctrine of belligerency – and thus, in the fullest sense, of “enmity” – marks his contribution to legal theory (Schmitt 2003).

Ayala holds that belligerency is an exclusive right of sovereigns. Without abandoning a moral conception of “just war” (*bellum iustum*), he insists that sovereignty is the formal criterion of belligerency. Only a sovereign entity can declare war, and only an entity which has declared war can engage in hostilities as a “just enemy” (*iustus hostis*). Therefore, he reasons, only sovereigns can be lawful enemies. Insurgents are to be treated as outlaws.

Certain historians have condemned this as a doctrine of “utmost cruelty ... presented in a cool manner with logical discipline” (Nussbaum 1954, p. 102). Others have concluded that Ayala’s formalization of belligerency led to a “hedging of war” in the epoch of classical international law (Dickmann 1971; Grewe 2000).

Báñez, Domingo

Born: 1528, Valladolid

Died: 1604, Medina del Campo

Jörg Alejandro Tellkamp
Departamento de Filosofía, Universidad
Autónoma Metropolitana – Iztapalapa, Mexico
City, Mexico

Abstract

The Spanish Dominican Domingo Báñez is best known for his leading role in the dispute regarding divine providence and free will held over the course of 20 years with Jesuit scholars, especially with Luis de Molina. He is usually associated with the so-called School of Salamanca, even though his theology and rigid interpretation of Thomas Aquinas is more speculative than, for instance, Francisco de Vitoria's who tended to have a more practical approach to issues concerning human conduct. The other field in which he excelled was in his interpretation of law and justice. Boasting a decidedly anti-humanistic Latin, his work can be seen as a turning point of Dominican theology after the Council of Trent.

Biography

Although being referred to as Mondragonensis because of his family's roots in the city of Mondragón, it seems certain that Domingo Báñez was born in Valladolid on 29 February 1528 (García Cuadrado 1998, 210). In 1542, he

began to study arts at the University of Salamanca, and from 1546 on he continued his studies at the Convent of St. Stephen taking his vows 1 year later. While studying theology from 1548 to 1552, he made Domingo de Soto's acquaintance, one of the most outstanding Dominican theologians of the first half of the sixteenth century and, after Francisco de Vitoria, one of the most recognizable scholars of the so-called School of Salamanca. Although not his student, Soto recommended Báñez for a teaching position, and in 1552, he first imparted courses of arts at St. Stephen and, in 1555, he continued as a lecturer of theology. In 1561, he graduated in theology after which he moved on to Ávila where he taught theology as well. At the University of Sigüenza, he finished his doctorate aiming at the chair of *Prima* at the University of Alcalá. After failing to obtain that chair, he returned to his teaching commitments at Ávila. There, from 1567 onwards, he taught at the convent of St. Thomas, and in 1569 he was appointed director of the convent, yet for only 1 year, after which he returned to St. Stephen in Salamanca where he resided until 1573. He then moved to Valladolid being for a short time director of the Convent of St. Gregory, and in 1574 he was appointed director of the Convent of Toro, although he did not accept the job. In 1576, he moved back to Salamanca with the intention to occupy the chair of Durandus which he finally obtained in 1577 after having to withdraw due to illness the year before. During that period he worked on the reformation of the Gregorian calendar and he also is known to have been Therese of Ávila's confessor. At the end of 1580, the eminent Dominican scholar Bartolomé de Medina died, leaving vacant the prestigious chair of *Prima* in Salamanca. Báñez won it after a hotly contested opposition in early 1581, and he would hold the chair until 1599. From 1582 on, he is ordered to publish his writings, mostly his commentaries on the *Summa theologiae*, thus starting a prolonged and publicized period of theological controversy. Interestingly, the Inquisition at one point initiated a process against him after accusations were made over his stance regarding the Eucharist. But it is the dispute with the Jesuits over the nature of

divine providence, foreknowledge, and free will that kept him busy most of the time. In 1597, he first unsuccessfully requested his retirement on grounds of poor health, but only in 1599 his request was finally granted. He spent his final years at the Convent of St. Andrew in Medina del Campo where he died 22 October 1604.

As already mentioned and unlike the *spiritus rector* of the School of Salamanca, Francisco de Vitoria, Báñez was told to publish his lectures given in the classroom. Those lectures are a substantial part of his written oeuvre; they comprise a series of commentaries to Thomas Aquinas's *Summa Theologiae*, some of which have been published during his life-time, such as the commentaries on the *Prima Pars* (1585b and 1614) or the commentaries on parts of the *Secunda Secundae* (1586 and 1594). Other lectures, however, such as the commentaries on the *Prima secundae* have only been edited in the twentieth century by Vicente Beltrán de Heredia. His other writings are either commentaries on Aristotle, such as the *Dialecticae summulae* (1589) or the commentary on *De generatione* (1585a) or they were written with the purpose to discuss the thesis regarding free will and divine necessity, some of which, such as the *Apologia fratrum praedicatorum* (1595), were published during his lifetime, yet many others were made available by Beltrán de Heredia (1968) in the twentieth century.

Heritage, Teachings and Legacy

The preceding biographical remarks show that Báñez considered himself a keen follower of the Dominican tradition, mainly in the spirit of the revival of Thomism, which made teaching and commenting the *Summa theologiae* a compulsory requirement for any Dominican teacher. From the outset, Báñez did not consider himself to be anything but a faithful follower of Thomas Aquinas, even though he time and again acknowledged indebtedness to Cajetan's commentaries to the *Summa theologiae* (1585b, col. 3). Aquinas's model is certainly a case of stylistic sobriety, and Báñez sympathized with it declaring, contrary to the humanistic spirit, that "the commonplaces of the orator's speeches do not please, but they

terrify" [ib.]. Truth in theology has to be clear and evident, such as shown in the *Summa theologiae* itself: "the Doctor (i.e., Aquinas) has offered so much dignity, so much sweetness of speech, so much modesty and profound humility of the catholic truth" [ib.]. Any adornment necessarily had to obscure the issues at stake, and for that reason, Báñez takes a deliberately anti-humanistic stance rejecting literary elegance not only as vain, but also as counter-productive. In this respect, he poignantly added one of his favorite quotations from Augustine's *De doctrina christiana* IV, 11: "What good is a golden key if it does not open? Or: what disservice does a wooden key if it does open?" (1585b, col. 12). As form follows style, Báñez believed that the most direct and unadorned interpretation of Aquinas's texts had to be goal.

The Debate *De auxiliis*

The most contentious debate of his career was held with thinkers that probably would have agreed with Báñez over the point of stylistic simplicity. The controversy *De auxiliis* showcased a doctrinal infighting that set the tone of the relationship between Dominicans and Jesuits for the next decades at least until Pope Paul V declared in 1607 the discussion to be over and that any further debate had to be avoided. What was at stake is one of the perennial problems in theology and philosophy, i.e., whether divine determinism overrides free will or whether it is compatible with it. In this case, the debate centered on the theological justification of how divine foreknowledge and providence do not contradict the undetermined human free will. For Báñez as well as for Molina the starting point was Thomas Aquinas's *Summa theologiae*, especially *Prima pars* question 14 article 13 in which the problem was raised whether God can know future contingents.

The salient aspect of Báñez's theory is his idea of physical premotion (*praemotio physica*), which he advances controversially in his commentary to the *Summa theologiae* and in a series of treatises written to refute the Jesuit's theory. From the theologian's point of view, two apparently contradicting assumptions had to be made compatible. On the one side, divine omnipotence and

providence accounts for a causally complete explanation of general and individual events in the temporal order of the created world. In other words, everything that happens is, inasmuch as it is based on secondary causes, necessarily related to a first cause, namely God. Without it, no secondary causes and no effects would obtain. On the other side, this deterministic picture stands in a stark contrast with the assumption that human beings are endowed with reason and free choice, thus being *causa sui* and hence standing outside the order of necessary causes. Certainly Báñez thought that both assumptions, i.e., divine necessity and free will, hold true. At least one grave problem arises: assuming that each and every rational agent is responsible for their actions, does this mean that the obtainment of grace can be explained without divine providence? Báñez denied this, and yet the need to hold rational agents responsible for their actions makes it necessary to reconcile divine necessity and free agency recurring to a particular brand of divine intervention (*auxilium*) in human affairs.

On the opposing side, the Jesuits held that divine intervention has to be limited to the foreknowledge of a broad range of alternatives among which human beings make their actual choice. In 1582, a public debate between Báñez and the Jesuit Prudencio de Montemayor took place in Salamanca. On this occasion, the latter emphasized that God does foresee only general aspects of human choice and thus “divine providence does not determine the human will or any other particular cause to good operation, but rather the particular cause determines the act of divine providence” (Matava 2016, 20). Montemayor, who consequently stresses the contingency of human action, goes on to conclude that any contrary doctrine has to be thought of as Lutheran, i.e., deterministic, although he probably had in mind Báñez.

The Jesuit point of view is usually related to Luis de Molina whose seminal work *Concordia liberi arbitrii cum gratiae donis* was first published in 1588. Molina famously advances a novel theory, according to which God’s providence and foreknowledge does not deny free choice articulating a compatibilist theory around the idea of middle knowledge (*scientia media*). To be sure, both Molina and Báñez agreed on the

basic tenets of divine foreknowledge vis-à-vis the contingency of creaturely reality, namely, that God has to be thought of as its necessary cause and that the secondary causes, i.e., the causes within the realm of created things, contingently cause effects that would not obtain without God’s cooperation (*concursum*) (Freddoso 1988, 18). They also accepted that divine foreknowledge covers the universality of events within the created universe so that it would be impossible for God not to know certain events that in fact happened or that could happen. The difference between both lies in their explanation of the nature of divine cooperation and the extent to which foreknowledge necessitates contingent events. Molina holds that free will and contingency are part of the created world. Hence, if indeterminate events are ever to take place, God’s necessary causal contributions for them to happen only reach as far as the secondary causes, leaving the effects of those causes undetermined. In other words, God’s natural knowledge of those events, before he wills them, does not cause them to happen. Molina’s theory points at God’s knowledge of what could happen (natural knowledge) and not of what actually happens. Yet at the same time, God, after he has willed the events to take place, has knowledge of what happened (free knowledge). *Scientia media* or middle knowledge is, then, God’s pre-volitional knowledge of contingent effects; it is a kind of knowledge located between natural (i.e., of what could happen before wills it) and free knowledge (i.e., what actually happened after God had willed it).

Báñez’s objected that Molina did not only inadequately explain Aquinas’s theory of divine foreknowledge of future contingents but that it left too much room for indeterminacy in the realm of contingent effects, which is inconvenient in light of God’s all-encompassing knowledge and causality. In fact, he thought that Molina, in introducing *scientia media*, drove a wedge between divine necessity and free will. In order to maintain free will’s own contingent causality and, at the same time, the causal necessity of divine foreknowledge, Báñez came to a solution that focuses on the issue from the point of view of divine causality. The answer to the problem consists in his unique theory of physical premotion (*praemotio*

physica). While it does not entail a theory of God directly moving objects physically in the material world, it is rather the idea that divine *auxilium* accompanies, so to say, developing contingent effects, without which they could not take place. Hence he says:

But I confess myself not to understand what else that divine premotion would be, if passively considered, than the faculty of intellect itself, placed in complete act by the author of nature, who operates in all things according to the design of his providence.

But if premotion is actively considered, according as it is in God, I understand it to be nothing else than the divine will, which is present in all things, effecting in them everything that they do, insofar as what they do has the notion of being and goodness. (1948, 384; transl. Matava 2016, 61).

Freedom and Rights

Apart from his untiring effort in the discussion regarding free will and divine foreknowledge, there are other topics in his writings that stand out. The most important one is probably his theory of justice, which in parts draws on his conception of free will in the sense that relations between human beings presuppose their free and rational communication in the light of a reality created by God (1594, 121a).

The right (*ius*) that someone can have regarding an object or a person is based on a hierarchical order in the sense that a superior part, e.g., a father, dominates the inferior one, the son in this case. In the end, however, it is God himself, being the supreme being, who exerts *dominium* over all of creation, including human beings (1594, 120a). This in turn implies that no human being is strictly speaking the owner of his or her life or of that of someone else. This limitation is especially relevant for his discussion of slavery, which Báñez considers to be some sort of rightful ownership (*dominium*). Slavery is a kind of dominium when, established from a legal point of view, it is seen as a consequence of the fall from grace. The original sin made property (*divisio rerum*) unavoidable mostly because from that point onwards human beings had turned greedy and selfish. But since God is, in the proper sense, the owner of human life, slavery is not, strictly speaking, ownership over the essence of a human being, but rather over

his or her freedom. This is what makes it possible to relinquish voluntarily ownership over one's freedom; the prevalence of life over freedom is the result of divine ownership of human life. After the fall from grace, all other relationships that imply ownership regarding earthly matters have their origin in civil law or in the *ius gentium*, which thus establishes a background for positive law (1594, 124a). Positive law, however, has to be based on universal normative principles that are not only legally valid but that are also binding in the court of conscience (1594, 10b). Those principles are equivalent to natural rights (*iura naturae*), all of which leads to a very strong Thomasian identification of law and justice.

Unlike his Jesuit opponents, Báñez today does not enjoy the same academic recognition. Being caught in the rigid methodology of accurately commenting Aquinas's *Summa theologiae*, Báñez does not seem to fit the ideal of the innovative thinker that most came to recognize in Molina. Yet if seen in the narrower context of the School of Salamanca, his work is indeed a departure from a more practical approach such as displayed by Francisco de Vitoria, preferring instead an analysis that explores the speculative roots of theology that has been highlighted in his debates with the Jesuits.

Barbaro the Younger, Ermolao

Born: Venice 1453/1454

Died: Rome 1493

Frank La Brasca

Centre d’Etudes Supérieures de la Renaissance,
François Rabelais University, Tours, France

Abstract

Ermolao Barbaro is an emblematic example of the complex relationship, often obliterated by the ideological simplifications in which the vulgarization of Renaissance culture and

thought has been founded, between the prescientific conceptions potentially elaborated in the medieval and scholastic philosophical speculations and the cult of the classical heritage passionately practiced in the courts since Petrarch, a fierce adversary of the barbaric language of the academic *studia* and a passionate advocate of the *Humaniores Litterae*. His family background and the geographical poles between which he moved (Padua and Florence) and his intellectual and speculative interests offer a good testimony of this: starting with a solid philosophical and juridical formation that enabled him to play a certain role as a diplomat, political functionary, and university lecturer, he dedicated a conspicuous part of his scholar production to classical philology, thus giving a well-recognized contribution on the establishment of the text Pliny’s the Elder *Natural History*, one of the main disputed intellectual questions that has shaped the erudite and scientific European debate from the Renaissance to the Enlightenment.

Alternate Names

Barbaro, Ermolao <il Giovane>

Biography

Nephew of the well-known humanist Francesco Barbaro, who had studied in Padua with Giovanni Conversini and Gasparino Barzizza and learned Greek under Guarino Veronese, Ermolao also had Guarino as his teacher of classics.

He studied classical languages in Verona under his homonym (his father Zaccaria’s cousin) Ermolao Barbaro il Vecchio (the Elder).

He joined his father in his travels to Rome where he attended the lectures of two well-known humanists Pomponio Leto and the Greek Teodoro Gaza and then to Naples where he wrote his first treatise on the celibate (*De coelibatu* 1473).

Later on, he obtained a doctorate in Liberal Arts (*in artibus* 1474) and another one in both

civil and ecclesiastical law (*in utroque iure* 1477) from the University of Padua.

In this same University, he taught Aristotelian moral philosophy in 1474–1479.

Active in Venetian political life, he served in different diplomatic missions in Bruges, Rome, and Milan and translated into Latin Aristotle's *Rhetoric* (published in Venice in 1472) and Themistius' commentaries on some Aristotelian treatises (*Themistii Peripatetici paraphrasis* first published in Treviso in 1481 but reprinted several times almost all along the sixteenth century in Venice [1502, 1559, 1560, 1570], Paris [1528, 1535, 1537], and Basel [1533, 1545]).

In 1484 and 1486, he lectured on Demosthenes, Theocritus, and Aristotle's *Poetic* in Padua. He was also an expert botanist who founded the botanical garden (*orto botanico*) of Padua in 1484 and wrote a commentary of Dioscorides' treatises on medicinal plants (published in Venice in 1516 and reprinted in Strasbourg 1529 and Cologne 1530).

In 1490, he was sent to Rome as ambassador of the Venetian Republic to Pope Innocent VIIIth after he had written a treaty on the office of ambassador (*De officio legati*, published in modern times with the *De coelibatu* already mentioned above (Barbaro 1969).

At the beginning of March 1491, the Pope elevated him to the ecclesiastical dignity of Patriarch of Aquileia (an ancient harbor on the Adriatic sea, today located in the Udine province of the Italian region of Friuli and which had been one of the most important ecclesiastical province from the Byzantine times until the eighteenth century), but without the consent of the Venetian authorities who ordered E. Barbaro to refuse this nomination.

The Pope enjoined him to obey, and consequently, E. Barbaro was forced to stay in exile in Rome where he died from the plague in July 1493.

Impact and Legacy

As we can notice by the dates furnished above, E. Barbaro's fame lasted long in the following century, but mainly as a peripatetic philosopher and commentator.

In recent essays, the stress have been made on his philosophical interests not alien, in spite what a certain traditional historiography, opposing in an excessive drastic way scholasticism and humanism, has often assumed, to the logical and physical speculations of the *Calculatores* of Merton College and the derived theory of Walter Burley on the *intensio* and *remissio formarum*. These aspects have been studied in particular in Barbaro's summary of natural science's principles as can be deducted from Aristotle, the *Compendium scientiae naturalis ex Aristotele* composed in 1484 and published in Venice in 1545 (Bianchi 2004: 351–362).

Nonetheless he deserves also to be mentioned as of the major philologists of his time and had been in relationship with the Florentine circle that gathered around Politian and Marsilio Ficino.

His very interesting correspondence (published in modern times by V. Branca in 1943 with his discourses and Latin poems) contains a famous polemical exchange he had with the great Giovanni Pico della Mirandola in 1485 about the central question of which style of language suited best philosophical speculation.

While Pico had defended the "Parisian style" of the scholastics which he thought more precise to express the subtleties of philosophical speculation, Barbaro replied that elegance and property of language should never been disjoined from intellectual quest for truth and happiness.

As we can see, this opposition is of great significance, not only to understand Humanist and Renaissance thought in relation with language and expression, but has kept all his importance in our modern era, where we are more and more concerned with the risks of dis-humanization implied in the tremendous advancement of the technical aspects of our daily lives, behaviors, and aspirations.

In his last years, E. Barbaro published in Rome his main philological work: an enormous collection of philological emendations (the modern critical republication of this work by Father Giovanni Pozzi in 1973 counts no less than four ponderous volumes) on Pliny the Elder's encyclopedia (*Naturalis Historia*) and of the most ancient geographical treaty of antiquity (Pomponius Mela's *Chorographia*).

The importance of this work (*Castigationes plinianae et in Pomponium Melam*, first published in Venice in 1492–1493) not only for the history of philology in general but also for the fundamental question of the reception of Pliny and of scientific knowledge in the Renaissance has been well documented by the modern editor.

Barlaam the Calabrian

Born: ca. 1290

Died: May/June 1348

Michele Trizio

Università degli Studi di Bari “Aldo Moro”,
The University of Bari “Aldo Moro”, Bari, Italy

Abstract

A Basilian monk, theologian, Catholic bishop, and scholar, Barlaam the Calabrian († 1348) is one of the most interesting figures in pre-Renaissance culture. He is known for having started the so-called Hesychast controversy, probably the most crucial cultural and religious event in fourteenth-century Byzantium. However, since his life and career bridges Byzantium and the West, B. is to be regarded as a fourteenth-century forerunner to the later generation of Greek émigrés that provided such impetus to Greek studies in Italy after the fall of Constantinople. His acquaintance with Francesco Petrarca, Leonzio Pilato, and possibly Giovanni Boccaccio and Paolo da Perugia suffices to establish B. as an important figure in the history of Greek studies in the pre-Renaissance West. B.’s reputation was also called into question during the Renaissance Plato-Aristotle controversy, as in the fifteenth century Francesco Filelfo conjectured that this had begun with B.’s alleged attacks against Plato.

Alternate Names

Barlaam de Seminara; Barlaam Mesari (or Masari or Massari)

Biography

Barlaam of Calabria, Barlaam Mesari (also spelled Masari or Massari), or Barlaam de Seminara was born around 1290 in Calabria, Southern Italy, in a Greek-speaking orthodox environment. During his early years in Italy, the young B. became a monk at the Basilian monastery of St. Elias in Galatro, though he may also have been acquainted with the monastery of St. Filarete in Seminara. B.'s biography gets less mysterious around 1325, when he moved to Greece, mainly Thessaloniki, which at the time was one of the leading centers in culture and the sciences. From there, B. frequently visited Constantinople, where he got acquainted with very important figures in the Byzantine aristocracy and imperial court. The reasons behind B.'s decision to leave Italy are unknown. According to his enemies, Gregory Palamas and Nikephoros Gregoras, B. was moved by the desire to live with his orthodox fellows and to read Aristotle in the original Greek. Both these witnesses are biased, although they may not err entirely in their claims. It is certain that B. achieved more than these two goals as he soon became a prominent figure in fourteenth-century Byzantine culture and politics.

With respect to the former, B. rivaled the aforementioned Nikephoros Gregoras, a giant of the scientific and philosophical landscape of the time; as to B.'s political and social ascension, he soon gained the support of the *Megas Domestikos* and later of Emperor John Kantakouzenos († 1383), who considered B. a protégé and appointed him to be the official court theologian around 1334 with the task of defending the Greek view on the procession of the Holy Spirit in front of the Latin ambassadors Franciscus de Camerino and Ricardus Anglicus. While debating with the Latin delegacy, B. was more concerned with the method of the theological discussions than with the topic of the debate. Thus he defended the Greek view of

the procession *ex solo Patre* by claiming that strictly apodictic arguments are unfit to theological matters, for these can only be discussed by means of Aristotelian dialectical syllogisms based on the Holy Scriptures, here understood as that on which the agreement among interlocutors ultimately rests. Since the Latin arguments could be neither apodictic nor dialectic, insofar as they are not shared by the Byzantine counterpart and are not based on the Holy Scriptures, the *Filioque* cannot be defended.

B.'s strategy did not please the Athonite monk and later Metropolit of Thessaloniki Gregory Palamas († 1359), who wrote two anti-Latin treatises supporting the apodictic demonstrability of the Greek dogma. Palamas went further and approached B., first through a common friend, Gregory Akindynos († ca. 1348), and then in person in a crescendo culminating in B.'s condemnation in 1341. B. had left Constantinople for Paris and Avignon in 1339 on a secret mission demanding Western support against the incoming Ottoman threat. However, his condemnation as heterodox in June 1341 and the death of his mentor and greatest supporter, the Emperor Andronikos III Palaiologos on June 15 of the same year, convinced B. to leave Constantinople for the West permanently.

The departure from Constantinople was the beginning of B.'s second life. During his earlier diplomatic mission in the West (1339), B. first visited Naples, then Paris, and finally Avignon. At that time, he must have built a network of relationships at the Neapolitan court of the Anjou and at the papal court in Avignon, for, after leaving Constantinople, B. sojourned precisely in Naples (late July 1341) and Avignon (late August 1341). At this point, B. renounced Orthodoxy and embraced Catholicism. In October 1342, Pope Clement VI († 1352) appointed B. as Bishop of Gerace, in Calabria, which nevertheless B. visited only for short periods. More importantly, in Avignon, he became acquainted with Francesco Petrarca and taught him some Greek. He may also have met Giovanni Boccaccio and Paolo da Perugia personally, possibly during one of his visits to Naples, whereas according to Boccaccio, the Homeric scholar and translator

Leonzio Pilato was B.'s *auditor* during B.'s stay in Gerace. B. returned to Constantinople one more time between the end of 1345 and the beginning of 1346. Then, after spending some few months in Gerace, he went back to Avignon at the end of 1346. He died there in June 1348.

Works and Themes

B.'s early works were all written during the first period of his sojourn in Constantinople and Thessaloniki (between ca. 1325 and 1337). In these, B. discusses scientific matters concerning mathematics (like in his *Logistica; De radice quadrato; Arithmetica demonstratio eorum quae in secundo libro Elementorum sunt in lineis et figuris planis demonstrata*) and astronomy (like in his *De eclipsi solari ann. 1333 et 1337 secundum magnam Syntaxin Ptolomaei, I-II; De paschate secundum Apostolorum canonem; Refutatio trium ultimorum capitum Harmonicorum Ptolomaei*). B.'s astronomical works are reminiscent of his harsh polemics with Byzantine erudite Nikephoros Gregoras, who in exchange targets B. in his satirical dialogue *Florentios*. B. also composed five short essays (transmitted as Λύσεις εἰς τὰς ἐπενεχθείσας αὐτῷ ἀπορίας παρὰ τοῦ σοφωτάτου Γεώργιου τοῦ Λαπίθου) on different philosophical and theological topics at the request of the Cypriot erudite George Lapithes.

The theological debates with the Latins on the *Filioque* (1334/1335) mark a turning point in B.'s life and work. From now on, theology becomes B.'s main concern. In his *Contra Latinos*, B. argues that no demonstrative argument applies to theological matters, for God and the divine properties, being absolutely transcendent and unknowable to men, cannot be the subject of a demonstrative science based on Aristotle's prerequisites as present in the *Posterior Analytics*. Intriguingly, B. will remain consistent with this view even in his later writings (like in the Latin *Epistulae*), where as a Catholic bishop he supports the Latin *Filioque* against the Greeks.

B.'s strategy during the discussions with the Latins was just the beginning of the violent

theological controversy of the following years. In fact, the Athonite monk Gregory Palamas († 1359) challenged B.'s refusal to address theological matters through demonstration and engaged in polemics which soon touched upon other issues, like the hesychast prayer purported by Palamas' monasticism, the status of the divine energies that is to say God's operations *ad extra*, and the value of profane learning.

B.'s approach to these matters is strongly influenced by philosophical authorities, though he confronts his opponent based on the exegesis of patristic authorities and Ps.-Dionysius the Areopagite as well. In B.'s view (espoused in his Greek *Epistulae*), the hesychast prayer is a bodily experience which as such is unfit to transcend the material world toward pure intellection. Accordingly, B. supports purification from bodily passions and false beliefs in a way which is strongly reminiscent of the Neoplatonic interpretation of Socratic Ignorance and follows the Neoplatonist Proclus in admitting that such purification is the *conditio sine qua non* for recollecting the intellectual knowledge innate to the soul. Thus, B. counters Palamas' mystical deification with a form of intellectual assimilation to God, something which harks back to the Christian appropriation of the Platonic definition of philosophy as assimilation to God insofar as humanly possible (e.g., *Republic* 10.613a-b; *Thaetetus* 176b; *Timaeus* 90a-d).

B. wrote several other works in response to Palamas' objections, but most of these (like B.'s *Contra Messalianos*) were destroyed after B.'s condemnation in 1341. However, snippets from these lost works can be extrapolated from Palamas' *Triads in Defense of the Holy Hesychasts*, in which the Athonite monks cite several passages from B.'s writings otherwise unknown to us. From these fragments, it seems that with respect to the status of the divine energies, B. underlines that postulating the existence of energies both uncreated and at the same time separated from God's essence is an impossible contradiction, just as Palamas did. Taking for granted that God is not identical with his energies, it would be safer – implies B. – to admit that the very status of such a distinction is beyond comprehension to

the human mind and is evident only in God's providential operations in the created world.

With respect to the value of pagan learning, B.'s Greek *Epistulae* follows the Church Fathers in granting pagan philosophers a sparkle of God's divine illumination. However, apparently B.'s lost works as transmitted by Palamas suggest that B. went further, stating that there exists only one wisdom for all men, which nonetheless is granted to the few (B. thinks here of the Apostles) by direct divine inspiration and is accessible to the rest of humanity through philosophical reasoning. Intriguingly, the source for this statement is the Neoplatonist Syrianus' commentary on *Metaphysics M-N*, a work on which B. relies in his extant work as well. On this basis, B. follows other Byzantine scholars of the past, like eleventh-century polymath Michael Psellos, in charging the extreme ascetism of certain monks of his time and their rejection of classical scholarship with ignorance.

In spite of the allegations by his contemporaries of being a Latinophrone (i.e., pro-Latins) and the modern interpretation, which sees B. as a Latin theologian transplanted into Byzantium, all the evidence suggests that B.'s culture and education was that of a Byzantine Greek. His knowledge of Latin theology is vague; even B.'s Greek handwriting differs considerably from the Greek Southern Italian literary hands and conform itself to the so-called fourteenth-century neoclassical writing style evident in mss. produced in Thessaloniki and Constantinople in that period.

Yet, B. deserves his place in the prehistory of the Renaissance thanks to his late acquaintance with Francesco Petrarca. In a letter to Nicholas Sigerus (date: 10 Jan. 1354), Petrarca claims to have taught B. some Latin (though B.'s Latin was probably better than Petrarca implies), in exchange for some classes in Greek, which Petrarca did not master at all (*Fam.* XVIII 2.9). More importantly, while praising B. as "modernum graie specimen sophie," Petrarca also claims to have seen "several books" containing Plato's dialogues in B.'s private library (*De sui ipsius et multorum ignorantia* IV). Unfortunately, Petrarca could not profit much from B.'s lessons in Greek; first B.'s duties in Calabria as Bishop of Gerace (a title which B. had gained through Petrarca's solicitude) and then B.'s death

brought Petrarca's study of the Greek language to a premature end (*Fam.* XII 2.7). But both he and his fellow Giovanni Boccaccio, together with Paolo da Perugia, anticipated the Renaissance approach toward Greek as the authentic source for reading and understanding the Classics in glorifying the Greek-Byzantine B. as an undisputed authority in the field of classical mythology and Greek studies in general.

In his *De genealogia deorum*, Boccaccio refers to B. as being teacher of both Paolo da Perugia, the librarian of Robert of Anjou, King of Naples, and the bizarre Leonzio Pilato, who, for the aforementioned reasons, hid his Southern Italian origins by presenting himself as a Thessalian or a Byzantine. Petrarca's (*Sen.* III.6) and Boccaccio's (*De genealogia deorum* XV.6) words on Leonzio's disingenuous attitude and poor scholarship are among the sharpest ever used by these poets, whereas their esteem for B. is always the highest. Finally, a Latin work attributed to B. called "Ethica secundum Stoicos" may have some connection, if proven genuine, with Petrarca's interest in stoicism, although Petrarca already had access to Stoic material through Cicero and Augustine. Yet B.'s Greek works favor the author's fondness for Platonic and Neoplatonic source material above other philosophical secs. Curiously, in spite of B.'s dependence upon Platonism, years later, Francesco Filelfo's letter to Bessarion (*Epistulae*, 31.39) identifies B. as the very source of the attacks against Plato and as being responsible for the Renaissance Plato-Aristotle controversy.

Abstract

This entry briefly examines the major contributions of Hans Baron to the intellectual history of the Italian Renaissance and beyond. It emphasizes Baron's conception of "civic

humanism” and how this concept remains influential even a century after its first introduction.

Biography

Hans Baron emigrated from the persecution of Nazi Germany for Italy, England and then the United States during the 1930s (Kohl 1990). In the U.S. Baron settled into a position at the Newberry Library in Chicago where he completed his historical masterpiece *The Crisis of the Early Italian Renaissance*, first published in two volumes in 1955 and then again in a revised single volume in 1966 (Baron 1955). The book presented Baron’s thesis on “bürgerhumanismus” or “civic humanism,” which he had first proposed in German in 1925 (Fubini 1992) and developed in the decades following (Molho 2008). Baron’s civic humanism thesis impacted studies across disciplines as well as across typical temporal and continental boundaries. It was without question among the most influential historical arguments of the twentieth century (Hankins 2000). Beyond the specifics of his civic humanism thesis, Baron’s insistence upon the importance of social and political contexts for the history of ideas has also had long-reaching impact on the field of Renaissance history.

Baron argued that a dramatic change occurred in the political thought of Florence after the year 1402. Prior to that date intellectual life in Florence was characterized by praise for the contemplative life of the scholar; praise for the Roman Empire; and a preference for Latin over vernacular writings. Yet, all of that changed in the face of political events in the early 1400s. From the 1390s Giangaleazzo Visconti had been expanding the number of allies and towns subject to the city-state of Milan. By the summer of 1402 Florence alone of the powers in northern Italy remained free from Milanese rule. Facing conquest and the prospect of what Baron characterized as an Italian unification under a Milanese tyrant, Florence remained free, but without allies and with diminishing hope of survival. However, in the autumn of 1402 Visconti unexpectedly died, his

armies and empire dispersed, and Florence experienced a patriotic jubilation that dramatically changed Florentine intellectual life. Florentine humanists began to condemn the contemplative life and instead favored the active life within government, business and the family. They rejected the Roman Empire, arguing that the emperors from Julius Caesar onwards were tyrants. Instead, they claimed that Florence was founded and was heir to the civic liberty and freedom of the Roman Republic. Alongside this new emphasis on civic life, liberty, and republicanism, Florentines also developed a new-found appreciation for the vernacular literature of Dante, Petrarch, and Boccaccio. These changes were characteristics of the new “civic humanism” in Florence (Baron 1955).

Both Baron’s concept of civic humanism and his attempts to explicitly bring together changes in social and political history with changes in the history of thought have proven immensely influential since the 1950s. Baron devoted significant sections of his text to establishing the dates of fourteenth and fifteenth century writings. Through more accurate dates Baron sought to show the impact of specific political changes on specific texts and their ideas. Over the past several decades scholars have disputed many of Baron’s dates as well as many of his assumptions and particular points about Florence, Florentine politics and society, and specific humanist texts (Hankins 1995; Baker and Maxson 2015). However, the piecemeal dismantling of Baron’s thesis has done little to diminish his influence. If Baron’s dates are contested, most historians now accept that political forces often influenced the history of thought. Additionally, even as the specifics of Baron’s arguments have been mostly refuted, the general concept of civic humanism continues to hold wide-ranging currency in the scholarship. Different variations of civic humanism have been applied and/or rejected to Florence as well as numerous other examples throughout the Italian peninsula during the late medieval and early modern periods. Outside of Italy, the idea has been traced through thinkers across Europe and the United States, from the medieval to the modern age (Hankins 2000; Pocock 1975). For Baron and

his supporters, civic humanism served as a foundation on which modern democratic values were based.

Barozzi, Francesco

Born: 9 August 1537, Candia (Iràklion), Crete

Died: 23 November 1604, Venice, Italy

Matteo Cosci

Università Ca’ Foscari Venezia, Venice, Italy

Abstract

Philosopher and Mathematician with Venetian origins, Francesco Barozzi (1537–1604) bound up his name to his *Cosmography*, an extended treatise on Ptolemaic cosmology

with many mathematical criticisms to Johannes de Sacrobosco's *Sphere*. During his career Barozzi merged his humanistic and antiquarian studies (as well as those regarding the history of ancient science) with esoterism and sorcery, so attracting the Inquisition's sentence against himself at the end of his life. His major contribution remains the recognized dignity of mathematics as a science, which he always defended as not inferior to the other ones, and even as essential for solving astronomical issues with a certainty that was regarded as superior to that provided by specious and inconclusive disputes.

Alternate Names

Barocius, Franciscus

Biography

As it was expected by a Venetian aristocratic gentleman born in a Mediterranean commercial outpost during Renaissance times, Francesco Barozzi spent his life alternating his residence between his colonial birthplace in Crete and his official homeland, Venice. Besides this, Barozzi spent the years of his cultural formation in Padua, where he studied Philosophy and mathematics, up to lecturing there on Sacrobosco's *Sphere* in 1559. In reference to this work, his major contribution was in fact the correction of many mistakes that he found by the way of mathematical proofs in that widespread academic text. He engaged in a lively correspondence about the number and the nature of those contended errors with the Jesuit Christophorus Clavius, who, on his turn, was the author of a commentary on Sacrobosco's *Sphere* (Spiazzi 1964; Rose 1977, pp. 135–139). Barozzi's positive results were further developed and published in the *Cosmography* (1585 and then 1598), his *magnum opus* in four books which had the fulfilled ambition of replacing Sacrobosco's textbook as the common and more authoritative reference for Ptolemaic cosmology. A fifth book, devoted to astronomy and astrology,

was left incomplete (Dublin Manuscript 2,1 Abbot n. 380); there he dismissed the heliocentric theory and retained the Alphonsine Ninth Sphere as a proper improvement on Copernicus' views. In addition to that, he published a study about the drawing of geometrical asymptotes and ellipses (the *Admirandum Problema*, 1586) and an *Opusculum* (1560), where he defended the certainty of mathematics as equal to the one provided by Logic and even as superior – from the human point of view only – to the one provided by Metaphysics.

He complemented his scientific research with a life-long activity of humanistic retrospective inquiry and unconcealed engagement with esoterism: a typical combination of interest for that age that Barozzi always pursued in a concurrent and parallel way. About the former, he recovered a great quantity of classical scientific books from ancient collections, constituting one of the most extensive private reference libraries on the topic. Nowadays the remaining archive of *Codices Barocciani* (MSS. Barocchi) is kept by the Bodleian Library in Oxford. Among the works that he recovered, edited, and translated, it has to be mentioned his Proclus' commentary on Euclid's first book of *Elements* (1560) an unpublished new edition of Pappus' *Mathematical Collections* (1588) and Heron of Alexandria's treatise on war machines (1572). He also transcribed ancient inscriptions directly from Cretan vestiges for his epigraphic studies.

About the latter, namely, Barozzi's open engagement with esoterism, we know that at least a couple of contributions were published under his name: a book on Nostradamus' predictions (*Universal Prognostication of the Whole World*, 1566) and another one on prophecies attributed to the Byzantine emperor Leo VI (*Oracula [or Vaticinia] Leonis*, 1577) (Rigo 1996). His multifaceted expertise included also astrology, alchemy, and sorcery, but this sort of predilection for the arcane and the occult had lead him into trouble with the Holy Inquisition, since he was tried twice with the accuse of apostasy and suspect of heresy, in 1583 and 1587. He was found guilty of offenses such as distilling love-philters, of wizardry for rainmaking, and also of

necromancy for having evoked a young lady in order to ask her about future and past events: all things which actually were common indictments for all those juridical attacks just based on doctrinal regulations. The penalty of imprisonment and the due payment of a related fine marked de facto the end of Barozzi's biographical and scientific parabola (Spiazzi 1964; Rigo 1996; Scomparin 1996). Nonetheless, his practical and theoretical appreciation for the value of mathematics in general, and within astronomic demonstrations in particular, remains as one of the most important steps toward the epistemic legitimacy of that controversial subject in Renaissance times (Rose 1977; O'Connor and Robertson 2006). Also in his first work, the *Oratio ad Philosophiam Virtutemque* (1557), he argued that the fulfilment of the soul is accomplished only by the study of philosophy and that mathematics, as the most important part of philosophy, ought to be studied above all.

Barros, João de

Born: Viseu, Portugal, c. 1496

Died: Ribeira de Litém, Portugal, 1570

Thomas Earle

University of Oxford, Oxford, UK

Abstract

Barros was educated at court and combined a literary career with an important role in the administration of Portugal's overseas empire. This enabled him to collect material for his great historical work, the *Décadas da Ásia* (Decades of Asia), for which he is best known. Though owing much to the Portuguese tradition of chronicle writing, and to the historians of ancient Rome, the Decades are original in the immense geographical range that they cover – the whole of maritime Asia and East Africa – and also in their impressive chronological sweep. However, he has been criticized for his reluctance ever to condemn the behavior of his fellow countrymen and for his concentration on individual deeds of heroism.

Rópica Pnefma (Spiritual Merchandize) is Barros's most significant work of religious polemic. It is an allegorical dialogue, aimed at the Portuguese New Christians, in other words, hastily converted Jews whose faith was believed to be suspect. However, it

contains much ambiguity, and Razão (Reason), the voice of Christian orthodoxy, does not always have an answer to the questions raised by the other speakers. Barros also shows some sympathy for the ideas of Erasmus, a writer who became increasingly suspect in sixteenth-century Portugal.

Barros's linguistic writings are a contribution to the study of vernacular languages which became widespread in southern Europe during the Renaissance. Barros is not overawed by the Latin inheritance of Portuguese and acknowledges the influence of oriental languages.

Biography

Educated at court, Barros combined a literary career with an increasingly important role in royal and imperial administration. By 1533, he was *feitor da casa da Índia* (administrator of the India House), responsible for the financial management of Portugal's overseas possessions. He made use of his position to collect information, including documents in Asian languages, for his great history of the Portuguese expansion in the East. He himself, however, never travelled further than São Jorge da Mina, on the coast of what is now Ghana. In 1567, he retired from his official position to his estate in the country, near Pombal, where he died three years later.

Works

In his own time, and subsequently, Barros is best known for his monumental historical work, the *Décadas da Ásia* (Decades of Asia). (Vols I-II, Lisbon, 1552–3; vol. III, Lisbon, 1563; vol. IV, incomplete and revised by J. B. Lavanha, Madrid, 1615). Rather surprisingly, he prepared himself for this feat of narrative history by writing a lengthy romance of chivalry, *Crónica do imperador Clarimundo* (Coimbra, 1522). His projected works on geography and on commerce have not come down to us. Barros also published religious polemic, most notably *Rópica Pnefma*

(Spiritual Merchandise, Lisbon, 1532), and books about the Portuguese language, including *Diálogo em louvor da nossa linguagem* (Dialogue in Praise of Our Language, 1540) and a grammar (1540).

Heritage and Rupture with the Tradition

As a historian, Barros was the heir of the flourishing chronicle literature of his own country, but as the title “Decades” makes clear, he was also a writer in the Roman tradition of Livy. His originality lies in the geographical range of his work, which covers the whole of maritime Asia and the coast of East Africa. He also has a broad chronological vision, going beyond the annalistic and regnal perspective of his Portuguese predecessors. He has been criticized, though, for his reluctance ever to condemn the behavior of his fellow countrymen and for his concentration on individual deeds of heroism.

Barros's linguistic writings form part of the current of study of vernacular languages that became widespread in southern Europe during the Renaissance. He is not overawed by the Latin origin of Portuguese, and points out the differences between the two languages clearly and without preconception in favor of one or the other. His knowledge of the East led him to recognize the influence of non-European languages, including Arabic, on his own (Buescu 1978).

Innovation and Original Aspects

The allegorical dialogue *Rópica Pnefma* is aimed at the New Christians of Portugal, that is, forcibly converted Jews, and some Moslems, who were thought to retain elements of their old faith. Barros clearly expected to persuade them of Catholic orthodoxy through the arguments of the dominant speaker, Razão (Reason). However, some of the other speakers, notably Vontade (Will) and Entendimento (Understanding), who from time to time can be identified with Jewish intellectual positions, make points which Reason is unable or unwilling to answer. Will and Understanding's

denial of the immortality of the soul has been linked to the skeptical philosophical tradition, originating with Averroes, which was prevalent among Iberian Jews in the Middle Ages (Révah 1975). Barros uses his characters as vehicles for social and ecclesiastical satire, and this, together with some ambiguous references to Erasmus, caused the book to be placed on the Index of 1581. It is difficult to arrive at a coherent view of the book as a whole, whose frequent paradoxes and changes of direction show how, in the relatively open Portugal of the 1530s, orthodox thought could sometimes be tempered by uncertainty.

Impact and Legacy

Barros was effectively the official historian of Portuguese Asia, and as a consequence his work has always been read. In the early modern period, Decades 1–2 were known abroad via the Italian translation made by the Spaniard Alfonso de Ulloa (Venice, 1561). His minor works tended to be forgotten. *Rópica Pnefma*, for instance, was not reprinted until 1869.

Bartholomew of Bruges

Born: 1286

Died: 1356

Pavel Blažek

Institute of Philosophy, Czech Academy of Sciences, Prague, Czech Republic

Abstract

Aristotelian philosopher, medical scholar, and physician active in Paris and Montpellier in the first half of the fourteenth century and author of philosophical *sophismata* and Aristotle commentaries, including commentaries on marginal and previously uncommented texts of the contemporary Aristotelian *corpus* (*De inundatione Nili*, ps.-Aristotelian *Economics*, Averroes' paraphrase of Aristotle's *Poetics*).

Biography

The philosopher, medical scholar, and physician Bartholomew of Bruges may be considered to be one of the most important representatives of the early fourteenth-century Parisian Aristotelianism. He began his career at the Faculty of Arts of the University of Paris where it is recorded that he was *magister artium* between 1306 and 1309.

B.'s six extant Aristotle commentaries date from around that period. They include a commentary with questions on Aristotle's *De anima* (1306 or before), an extensive *quaestio* commentary on Aristotle's *Physics* (1307), as well as undated *quaestiones* on *De generatione et corruptione*.

His main contribution to the medieval reception of Aristotle is his commentaries on three marginal texts of the medieval Latin *corpus aristotelicum*. His 1307 commentary on Averroes' paraphrase of Aristotle's *Poetics* (translated into Latin in 1256) is the only medieval commentary on this work and one of the rare specimens of the reception of Aristotle's *Poetics* before the fifteenth century. Following the tradition of

Al-Farabi and Gundissalinus, Bartholomew defines *Poetics* as a part of logic and an aid to moral philosophy.

Equally unique among medieval and renaissance Aristotle commentaries is his uncompleted commentary, surviving in a shorter and longer version, on *De inundatione Nili*, a (pseudo?-) Aristotelian treatise on the causes of the annual Nile flood. Bartholomew argues, on stylistic and doctrinal grounds, for the authenticity of the text which he considers an appendix to Aristotle's *Meteorology*.

The most influential of his works on Aristotle is an extensive commentary with *quaestiones* on the pseudo-Aristotelian *Economics* (1309), an ancient philosophical treatise on the household and marriage attributed to Aristotle that was translated twice into Latin in the thirteenth century. The commentary served as model for the *Economics* commentary of Albert of Saxony (1359), and it was partially translated into French by Nicole Oresme (ca. 1372). Bartholomew defines the *Economics* as Aristotle's textbook of the "science of the household community" (*scientia de communitate domestica*) which he considers to be a fully fledged Aristotelian *scientia* and a branch of practical/moral philosophy. The commentary contains an extensive philosophical discussion of the structure of the household and its relationship to the political community, of the natural and monogamous character of marriage, as well as of the relationship between husband and wife and their respective roles and duties within and outside the household.

B. also wrote ca. fifteen shorter philosophical treatises on logic, epistemology, and metaphysics. At least four of these *sophismata* are the outcome of philosophical disputes with colleagues from the Arts Faculty. This is also the case of his best-known *sophisma*, the *Sophisma de sensu agente*, going back to a controversy with the Averroist John of Jandun (d. 1328) and addressing the question about the sensation of material objects by the sensitive faculty of the soul.

After 1309, evidence of Bartholomew's activity at the Arts Faculty disappears. The next period of his life is marked by a radical career shift to medicine. In 1329, he resurfaces in the sources as

a private doctor of Guy I of Châtillon, the Count of Blois, in whose services he shall remain until the count's death in 1342. In 1333, he is at the University of Montpellier as a regent Master of Medicine. His medical writings probably date from that period. Less numerous than his works of philosophy, they include commentaries on Avicenna's *Canon* and on Galen's *Tegni* as well as a tract on the pest. As Cornelius O'Boyle has shown, some medical writings formerly attributed to him (such as a commentary on the *Isagoge* of Johannitius, or a commentary on the Hippocratic *Prognostics*) belong to his older namesake, the twelfth-century Italian medical scholar Bartholomew of Salerno.

Bartolus of Saxoferrato

Born: 10 November 1313/1314, Venantura

Died: 10 July 1357

Francesco Maiolo
University College Utrecht, Utrecht,
The Netherlands

Abstract

The name of Bartolus de Saxoferrato (1313/1314–1357) is associated with late medieval legal theory and practice, although a tradition initiated by his pupil Baldus de Ubaldis (1327–1400) portrays him as a man devoted to practice more than to theory. Bartolus was a brilliant teacher and a prolific writer. Thanks to

his critical insight, which pervades his *commentaria*, *tractatus*, *quaestiones*, and *consilia*, the hermeneutics of the *Corpus Iuris Civilis* became a science aimed at the solution of the practical problems of late medieval society. In the realm of law, two clusters of questions have been debated, one concerning Bartolus' influence on the development of civil law and the other concerning the authorship of a number of writings attributed to him. Bartolus' relevance to philosophy is negligible, even if his conceptions of jurisprudence and truth in legal reasoning correspond to a certain philosophy of law. His ideas are relevant in the perspective of Renaissance political philosophy: Bartolus paved the way for the modern conception of territorial sovereignty and for a rejection of tyranny on legal-theoretical grounds.

Biography

Bartolus was born in Venatura, a village close to Saxoferrato in the province of Ancona, territory of the future Duchy of Urbino. His precise date of birth is unknown but must have been between 10 November 1313 and 10 November 1314. Most likely his father Ceccus, a small landowner of modest means, belonged to the Severi family, whereas his mother was named Santa Alfani. Two Franciscan friars, Peter of Assisi and Guido de Perusio, took care of his primary education. The former played an important role in Bartolus' formation and presumably provided the financial means enabling him, at the age of fourteen, to study law at Perugia under the guidance of Cynus de Pistoia (1270–1336/37). Bartolus' attachment to the Franciscans was notable. Various parts of his *commentaria* and a number of *consilia* are concerned with the problem of the management of the property of Franciscan convents, including hereditary matters, and the problem of the legal representation of those communities. The *Liber minoricarum decisionum* deals with these questions in particular. Cynus encouraged Bartolus to abandon the old interpretative method and embrace the dialectical

techniques developed at the School of Orléans. Possibly due to the transfer of Cynus to Florence, in October 1333 Bartolus moved to Bologna, where, under the guidance of Jacobus Butrigarius (1274–1348), on 15 December 1333 he attained the title of *baccalaureus*. On 17 September 1334, presented by Butrigarius, Bartolus defended his doctorate before a commission presided over by the canonist Johannes Calderinus (ca. 1300–1365). Among the ten members of the commission were the masters Jacobus de Belviso (1270–1335) and Raynerius (Arsendi) de Forlì (d. 1358). On 10 November 1334, Bartolus received his doctoral degree in the Cathedral of St. Peter. During the subsequent 4 years, he exercised judiciary functions in Todi, Cagli, and Macerata. In either 1338 or 1339, he married Pellina Bovarelli, who belonged to a wealthy family. They had two sons and four daughters. In 1339 Bartolus moved to Pisa where he initially exercised judiciary functions and later became professor of civil law. At the end of 1342, or in the early spring of 1343, Bartolus moved to Perugia. In 1348 the outbreak of the Black Death caused an interruption of all academic activities. In October 1348 full citizenship was conferred upon him, his two brothers, and their descendants. He was also granted the permission to hold a salaried chair. Supposedly Bartolus served as a member of the city council. A notable episode concerns his participation as a member of an embassy representing Perugia to Emperor Charles IV (1316–1378) at Pisa between May and June 1355. The Emperor received the famous law professor with great honors and made him imperial *consiliarius* and *familiaris domesticus commensalis*. The Emperor is also said to have given him, and any of his heirs who attained the title of doctor of law, among other privileges, the *venia aetatis*, whereby a minor was declared to have attained his majority before the age of 25. In his unfinished *Tractatus de insignis et armis*, Bartolus claimed that the Emperor granted him a coat of arms consisting of the image of a red lion with a twofold tail on a golden field. It is almost certain that the imperial grant never occurred. Moreover, the lion represented in the coat of arms of the Bohemian kings was two-tailed, but

silver on a red field. Bartolus died presumably on 10 July 1357, but nothing is known of the circumstances of his death (Calasso 1964; Cavallar et al. 1994; Condorelli 1995; Cortese 1995; Bellomo 1998; Lepsius 2004; Treggiari 2009).

A Contested Legacy

Bartolus was the most famous of the commentators, a juristic school mainly concerned with the potential for practical application of the Roman law. The commentators sought a harmonization of the Roman law, local law, customary law, and canon law. Bartolus abhorred the dialectical subtleties in use at Orléans, but he shared with the French jurists the opinion that the authority of the Accursian gloss had to be questioned whenever necessary and convenient. He was often referred to as “the lantern of the law” and the “king of the law.” The maxim “no one can be a good jurist unless he is a Bartolist” (*nullus bonus iurista nisi sit Bartolista*) remained of common usage for a long time (Calasso 1964; Feenstra 1972; Cortese 1995).

In the fifteenth and sixteenth centuries, in various Italian universities, courses were designed taking Bartolus’ *lecturae* and *repetitiones* as a model. In Spain and Portugal, royal decrees sanctioned that the *opinio Bartoli* should be followed where Roman or canon law, as well as certain parts of the Accursian gloss, was silent. King Philip II, who had associated the throne of Portugal to that of Spain (1580–1640), continued this tradition of favor by sanctioning the same principle in the *Ordenações Filipinas* published in 1603, after his death. This codification was applied to Brazil, where the legislative sanction of the supremacy of the *opinio Bartoli* was formally valid until the promulgation of the 1916 Civil Code (Calasso 1964). The emergence of humanism, and humanistic jurisprudence in France in particular, marked the beginning of the history of Bartolus’ discredit. Lorenzo Valla (1407–1475) considered Bartolus guilty of misinterpreting the Roman law due to his ignorance of history and Latin. Guillaume Budé (1467/68–1540), François Baudouin (1520–1573), and

François Hotman (1524–1590) expressed aversion to scholastic jurisprudence (Feenstra 1972). Bartolus came to be seen as “the plague of the intellect” and “the assassin of erudition.” Humanistic criticism of the *auctoritas Bartoli* took brilliant literary form, thanks to François Rabelais (1494–1553), who in *Pantagruel* (1532) ridiculed the jurist and other masters of the *mos italicum* not only for their ignorance of Latin, Greek, history, and philosophy but also for their habit of allegedly twisting justice for the sake of private gain. The negative evaluation of Bartolus among the French *culti* was not univocal. Jacques Cujas (1522–1590), Hugues Doneau (1527–1591), and Jean Bodin (1530–1596) praised Bartolus as a lawyer, even though they attacked his doctrine of the Emperor as “the lord of the world (Maiolo 2007).” The anti-Bartolist tradition was partially absorbed by the natural law schools of the seventeenth and eighteenth centuries and subsequently by the historical school (Lepsius 2003).

Jurisprudence, Truth, and Legitimacy

Medieval jurists were convinced that it was their proper task to concern themselves with problems of political authority, the main normative argument being that justice and tranquility are the chief subject matter of law. In opposition to the Aristotelian teaching that saw jurisprudence as a province of “practical knowledge,” they treated ethical matters as a province of jurisprudence. They revered the idea that the law had to be the implementation of God-given values, as well as the idea that knowledge for its own sake is shameful vanity. In order to justify the pre-eminence of jurisprudence, they argued that the fundamental legal principles of Roman law, the latter being “written reason,” contradict neither the laws of nature nor divine law, but rather actualize them in concrete situations. The roots of their conception of law as knowledge divinely founded were in the opening pages of the Digest: law is the art of knowing what is good and just (Dig. 1, 1, 1), and jurisprudence is awareness of divine and human affairs, as well as knowledge of what is just and unjust (Dig. 1, 1, 10, 2; Inst. 1, 1, 1) (Woolf 1913;

Paradisi 1983; Quaglioni 1983; Pennington 1993). In one doctoral sermon attributed to him and dedicated to his brother Bonaccursius, Bartolus defined jurisprudence as the “perfect science,” “the queen of the sciences” – save theology. Borrowing a powerful image from the Revelation of St. John (Rev. 18, 7), he proclaimed that “she will never be a widow” (Bartholus de Saxoferrato 1576). In order to support this assertion, he oddly mentioned that the jurists occupied the first position in civic parades and official ceremonies (Maiolo 2007).

The perfection that Bartolus attributed to jurisprudence is also the consequence of her power to bring certain entities into existence out of nothing. This particular power implies a certain qualification of truth in legal reasoning and becomes intelligible through the notion of legal personality. The expression *persona ficta et repraesentata* was used to denote public law corporations such as the city-states as well as private law bodies such as foundations and trusts (Woolf 1913; Ullmann 1962; Segoloni 1980; Canning 1987). Ulpian established the principle that what is owed to the corporation is not to be owed to its members, and what the corporation owes to others is not owed by its members directly (Dig. 3, 4, 7, 1). For Accursius (b. 1181/85), a corporation is a mere collection of men, even though he recognized that corporations and individuals are conceptually distinct. For the jurists at Orléans, certain bodies could exist independently of the individuals who are part of them. The canonists developed the idea that crime and excommunication can be ascribed to collectivities, specifying that each collectivity is a *nomen iuris*. In opposition to the Accursian gloss, Bartolus emphasized that what pertains to the whole does not pertain to its parts. In the *Tractatus de regimine civitatis*, he compared the city-state with the “artificial and imaginary man” (Bartholus de Saxoferrato 1576). A legal person is not a person in the ordinary sense because legal reasoning differs from common sense as well as from philosophical or theological reasoning (Woolf 1913; Ullmann 1962; Quaglioni 1983; Ryan 2000; Skinner 2002). By means of an inaccurate generalization, Bartolus asserted that for philosophers and canonists an association is

nothing other than the people making it up; lay jurists found it useful to substitute ordinary truth for fiction under certain circumstances. At the same time Bartolus believed that the meaning of *populus*, for example, is the same under different circumstances. To say that an organized group of people constitutes a *populus* is to say that such a group has a certain peculiar quality manifested in some kind of substance. Yet Bartolus promoted neither the fiction theory nor the realist theory (Bartholus de Saxoferrato 1576). He was not concerned with the philosophical question of whether the universals are mental constructions of human reason or extramental entities. Rather he defended the principle that it is proper to the logic of legal reasoning to replace truth with fiction (Maiolo 2007). He was interested in making it legally possible for the city-state to recognize no superior, even if ontologically the latter was certainly not that of which no superior could be conceived. The replacement of truth by fiction was the expression of both juristic virtuosity and political prudence (Segoloni 1962; Kirshner 1973; Canning 1987; Ryan 2000).

Bartolus defended the validity of the universal lordship (*dominium mundi*) of the Emperor, a lordship which was jurisdictional, not patrimonial. To deny it was to fall into heresy (Bartholus de Saxoferrato 1576). Yet he sought to harmonize the imperial ideology with the Christian doctrine that all powers come from God. Each according to its proper task, temporal and spiritual, respectively, Empire and church had the function to lead the Christian people toward salvation. To claim that they had distinct and separate jurisdictions was again to fall into heresy. The advent of Christ had marked a radical change in the interpretation of the origin of the Empire: God’s providence was its remote efficient cause, whereas the Roman people were its proximate cause. On account of the Donation of Constantine, which he considered to be genuine, Bartolus justified the papal control of portions of central and southern Italy that were formally part of the Empire (Cortese 1995). His conclusion was that the Emperor has no jurisdiction in spiritual matters, and his jurisdiction in temporal matters can never go beyond the borders of the territories nominally

subject to his authority. The Pope has universal jurisdiction in spiritual matters and a jurisdiction in temporal matters that is valid only in the territories subject to his direct control. Bartolus admitted that the Emperor was under the laws by free will, not necessity. Yet he is bound to keep treaties with the city-states for those agreements have their roots in the laws of the nations (Bartholus de Saxoferrato 1576; Woolf 1913; Segoloni 1980; Paradisi 1983; Quagliani 1983; Canning 1987; Pennington 1993; Ryan 2000; Skinner 2002). In fourteenth-century northern and central Italy, the Emperor was seen as the ruler of part of Germany rather than the bearer of universal authority. Since the time of Frederick I “Barbarossa” (1122–1190), some communes had based their autonomy on imperial consent through acquiescence, although some of them factually recognized no superior. Bartolus provided a legal justification for the factual political independence of the latter, ascribing to them the totality of powers hitherto reserved for the Emperor. In this respect Bartolus is said to have paved the way for the modern conception of territorial sovereignty (Woolf 1913; Canning 1987; Pennington 1993; Cortese 1995; Ryan 2000; Skinner 2002; Jonas Cesar 2004). He emphasized the importance of popular government (Ullmann 1962; Segoloni 1962; Kirshner 1973; Ryan 2000; Skinner 2002). We do not know to what extent he was a profound reader of both Aristotle and St. Thomas Aquinas even if he considered both of them authoritative. According to Bartolus, the up-and-coming seignorial rule was detrimental to the system of the communal liberties. Seignorial government remained a matter of concern beyond the fourteenth century. Bartolus’ *Tractatus de tyrannia* constitutes an antecedent for the humanist treatment of the matter. This work influenced, among others, Coluccio Salutati (1399–1400), Girolamo Savonarola (1452–1498), and Francisco Suárez (1548–1617) (Quagliani 1983; Lepsius 2003; Kirshner 2006). Bartolus sought to demonstrate the intrinsic illegality of tyranny. He first distinguished between manifest and concealed tyranny. Then, within manifest tyranny, he distinguished the case of the tyrant who holds power in the absence of a legitimate title, that is, the usurper of sovereign prerogatives, from the

case of the tyrant who abuses power, that is, the abuser of legitimately assumed sovereign powers. Finally, he defined concealed tyranny as that of he who abuses sovereign powers under a veil of lawfulness. Concealed tyranny can be established either through machinations that make one private citizen gain possession of an office institutionally significant or through the assumption of a position that remains concealed (Bartholus de Saxoferrato 1576; Woolf 1913; Quagliani 1983).

Baxter, Richard

Born: 1615

Died: 1691

Jason A. Kerr
Department of English, Brigham Young
University, Provo, UT, USA

Abstract

Richard Baxter (1615–1691) was an English Puritan minister and prolific author of works on primarily religious subjects. His contribution to late Renaissance thought lies at the intersection of religion and politics, on three fronts: his theology of justification, his political thought, and his work in the area of ecclesiology.

Biography

Richard Baxter (1615–1691) was an English Puritan minister and prolific author of works on primarily religious subjects. He rose to prominence during the 1650s Interregnum and remained influential to the end of his life, although in diminished circumstances with his loss of ministerial employment following the 1662 Act of Uniformity. His contribution to late Renaissance thought lies at the intersection of religion and politics, on three fronts: his theology of justification, his political thought, and his work in the area of ecclesiology.

Baxter's writings on justification emphasize human moral responsibility, in contrast to the Lutheran free-grace position espoused by John Saltmarsh and others (Cooper 2001). For Baxter, justification requires an act of faith that he figures as a peppercorn given by a defaulting tenant as a token of homage allowing him to remain on the land (Baxter 1649; Boersma 1993).

Baxter's political thought appears chiefly in *A Holy Commonwealth* (1659), which opposes both the republicanism of James Harrington's *Oceana* and the godly popular sovereignty of Henry Vane's *A Healing Question*. For Baxter, sovereignty derives from God, not the people, and yet the same human moral accountability to God found in the writings on justification means that the obligation to obey the powers that be cannot be as absolute as in mainstream Calvinist teaching. Baxter insists that people do not owe obedience to magistrates per se, but to magistrates as officers of God. In keeping with the Calvinist allowance that inferior magistrates can legitimately resist sovereigns, Baxter acknowledges that in practice Parliaments might be better situated to determine when public resistance might be appropriate, and yet he still allows that individual subjects can engage in personal, private resistance. Political circumstances necessitated that Baxter retract *A Holy Commonwealth* in 1670, but a 1686 manuscript treatise demonstrates his continued adherence to its principles (Lamont 1979; Argent 2014).

Baxter's major significance lies in his work as a churchman. During the Interregnum he became an influential ministerial example of a political Presbyterian – someone who had sided with Parliament against King Charles I and yet opposed the regicide in 1649. He resisted attempts on the part of Oliver Cromwell and John Owen to remake the national church on an Independent model. At least until the mid-1670s, Baxter consistently preferred comprehension, or a broadly inclusive church, to toleration, or the idea of a narrower church that allowed for the existence of other churches (Lamont 1979). He expressed this preference for comprehension by calling himself a “mere catholic Christian,” a phrase that gave

C. S. Lewis the title for *Mere Christianity*. Baxter, however, resolutely opposed Hugo Grotius's defense of the idea that Christendom might be united under a universal human sovereign (Keeble 1982).

Baxter's career as a churchman has two major phases. During the Interregnum and in the negotiations that produced the Restoration church settlement, he consistently advocated for comprehension. A model for a comprehensive church could be found in the county association movement that he founded as a mechanism for local ministers of varying persuasions to collaborate on pastoral goals. After the Act of Uniformity, Baxter became a nonconformist. His activities during these years consisted largely of writing – his 1673 *A Christian Directory* put in print the pastoral advice he would give if permitted to hold ministerial office – and occasional preaching. These activities culminated in a trial and imprisonment during the 1680s (Lamont 1979). Baxter's continued pressing for comprehension, against the toleration urged by Owen and other Congregationalists, meant that nonconformists were never able to make common cause when the opportunity arose (for instance, in 1667–68, 1672–73, and 1680–81; see Cooper 2011). His *Reliquiae Baxterianae* (1696) remains an important historical resource for the last half of the seventeenth century.

Baxter's significance for twentieth-century philosophy lies in the important role that he plays in Max Weber's *The Protestant Ethic and the Spirit of Capitalism*, which presents him as an influential early articulator of the Puritan work ethic.

Beati, Giovanni Francesco

Died: 1546

Craig Martin

Dipartimento di Filosofia e Beni Culturali,
Università Ca' Foscari Venezia, Venice, Italy
Department of History, Oakland University,
Rochester, MI, USA

Abstract

Giovanni Francesco Beati taught metaphysics at Padua and Pisa. His most significant work proposed repositioning the second book (alpha minor) of Aristotle's *Metaphysics* to the beginning of book two of the *Physics*.

Biography

Giovanni Francesco Beati (died 1546) was a Dominican friar and theologian. He taught in Dominican convents in Lombardy and then at Treviso, where he became prior at San Nicolò in 1521 (Mazzuchelli 1760, 2:570). He then took up a chair metaphysics *in via Thomae* at Padua beginning in 1531 before moving to Pisa, where he taught from 1543 to 1546. He was referred to as being from the Veneto and was likely born in Treviso. He had a few contacts with other famed intellectuals of his era. Benedetto Varchi, the Florentine scholar, seems to have followed his lectures at Padua, and he apparently had contacts with the humanist cardinal Jacopo Sadoleto, to whom he dedicated his second book (Quétif 1721, 2:123 Fabroni 1792, 2:128–29; 2:464).

Beati published two books during his lifetime, both interpretations of Aristotelian philosophy. He also wrote an *enarratio* of the introduction of Aristotle's *Physics*, which remains in manuscript (Lohr 1988, 36). His earlier work, printed in 1542, is a brief *quaestio* on the seventh chapter of Averroes' *De substantia orbis* that attempts to reconcile the principles that the heavens are finite and have a finite power yet are eternal. The work

Beast

► Devil, Renaissance Idea of

was one of many commentaries on Averroes' writing that were published during the sixteenth century (Martin 2013). Beati applied deep knowledge of the Greek commentators of Aristotle (Alexander of Aphrodisias, John Philoponus, Themistius, and Simplicius) in his discussion of this question and his interpretation of Averroes.

In his second work printed in 1543, greatly influenced by Alexander of Aphrodisias, he argued that the second book (alpha minor) of Aristotle's *Metaphysics* should be placed as an introduction or prologue to the second book of the *Physics* because its discussion of causality is more connected to the natural world than first philosophy. In particular, he held that Aristotle's argument in the second book of *Metaphysics* that contends there are a limited number of causes was a suitable introduction to the discussions of causation in the *Physics*. Furthermore, he believed the references to nature at the beginning and end of the book (993b1–2; 995a17–19) point to the discussion of nature and natural substances in the *Physics* (Kraye 1991, 145–46).

While Beati's proposal did not change editors' placement of the book, at least a few Renaissance thinkers found it worthy of consideration. Notably, the leading Aristotelian commentator and translator, Francesco Vimercati, praised Beati as deeply knowledgeable of Aristotelian philosophy even if he ultimately rejected Beati's interpretation (Vimercati 1550, 91–93). A few even used Beati's arguments to undermine Aristotle's authority. Mario Nizolio, a humanist who favored rhetoric over Aristotelian philosophy as a route to wisdom, contended that the misplacement of the book showed that imperfect transmission of the Aristotelian corpus. Similarly, Francesco Patrizi, without mentioning Beati, employed Beati's argument to further his argument that the *Metaphysics* as transmitted was the result of a multitude of editorial errors (Kraye 1991, 147–52).

Beauty, the Renaissance Idea of

Elisabeth Oy-Marra
 Institut für Kunstgeschichte und
 Musikwissenschaft, Johannes Gutenberg
 Universität Mainz, Mainz, Germany

Abstract

The idea of beauty in the Renaissance relies heavily on Plato's thoughts about beauty as the emanation and splendor of the divine. The Florentine Neoplatonists, among them Marsilio Ficino, were responsible for the distribution and new reading of Plato's views in the early Renaissance. The idea of beauty, however, was discussed not only in philosophical treatises but also increasingly in the art literature. The leading concepts here are, on the one hand, imitation and, on the other, the work of art as the manifestation of beauty and hence the participation of the viewer in its perception. While the idea of beauty was formulated by Leon Battista Alberti in relation to the imitation of nature in his treatises *De pictura* (1435) and *De re aedificatoria*,

the concept of *grazia* (grace) played a leading role in the discussion of the work of art as a material manifestation of beauty. Even more important, the concept of the indefinable presence, the “non so che,” which later became known as “je ne sais quoi,” appears early in the famous *Dialogue* of Lodovico Dolce (1557).

Heritage and Rupture with the Tradition

The question of what beauty is had no systematic place in Renaissance philosophy. Only in the eighteenth century did beauty become the object of philosophical aesthetics. Since antiquity, however, theoretical reflections on beauty have nonetheless reached far beyond the realm of the sensually perceptible. It was especially Plato, who, in his dialogues, sought a normatively universal concept of the beautiful in opposition to the sophists. The power of the beautiful was defined by Plato as the expression of a normative idea and not as a means of affective persuasion. The idea of the beautiful can be experienced only in a vision of the soul. This ideal beauty is described in Plato’s *Symposium* (210e–211b) as something which is “everywhere and eternally the same.” In his late dialogues, Plato emphasized the role of order, symmetry, and measure, thus laying the foundation for subsequent reflections on the concept of beauty (Eusterschulte 2012, cols. 1148–1149). While Plato had not afforded the arts a role within his idea of the beautiful, the Neoplatonist Plotinus expanded on Plato’s eidetic concept of beauty in a way that could include them. For Plotinus, a thing is beautiful only when it conveys participation in an intelligible idea, which manifests itself in form and design. The experience of beauty occurs through the contemplation of the soul within itself, which, at the same time, seeks the transcendent One and which becomes a condition for artistic creation based on form (ibid., col. 1158). This understanding of the work of art, which participates in the beautiful through the contemplation of the soul, is fundamental not only for the medieval understanding of God as eternal beauty, loveliness, and sweetness,

which Alcuin, who taught at the court of Charlemagne, presented as a counterpoint to a devotion oriented toward sensual pleasures. According to Thomas Aquinas, the relationship between good and beautiful (*bonum* and *pulchrum*) is likewise based on form. Those things are beautiful, in his view, that please by virtue of the knowledge of the senses. The senses delight in well-proportioned things and relate to God as the original cause of form. For Thomas, God is beautiful because he is the cause of the consonance and clarity of all things (Assunto 1996; Eusterschulte 2012, col. 1160). This Christian metaphysical tradition would ultimately determine the debates concerning beauty during the Renaissance as well. A key vehicle for its mediation was, of course, the work of Marsilio Ficino (1433–1499), who translated the works of Plato, Plotinus, and the Corpus Dionysiacum, combined them with traditional concepts from the Middle Ages (light metaphysics, aesthetics of proportion, and the concept of form), and advocated a Christian Platonism. For Ficino, beauty is immaterial but manifests itself physically in *actu*, *vivacitas*, and *gratia* and is ultimately the reflection of the Platonic idea of beauty (Eusterschulte 2012, cols. 1164–1166).

Innovative and Original Aspects

At the same time, the Renaissance can be understood as an epoch in which fundamental groundwork was laid and in which beauty was closely associated with sensual perception without abandoning the divine origin of beauty. Because visible nature was considered deficient – since it deviated from God’s plan (Leinkauf 2005) – art was tasked with both recognizing beauty in the first place and developing a presence accessible to the senses. Mediated by Neoplatonism, which had already strengthened the position of the arts, discourses on art in their own right emerged during the Renaissance, in which the artist was regarded as a participant in the grace (*grazia*) of God and thus the work of art itself as a “manifestation” of *grazia* (Krüger 2016). In literature on art, furthermore, the idea of the beautiful was elevated to a condition and goal of artistic creation. Although

the beautiful was now perceptible in a work and became accessible through aesthetic discourses, it nevertheless remained within the context of notions of wholeness, perfection, and participation in the divine.

Just how powerful these traditional concepts were becomes especially clear in the reflections on the beautiful by Lorenzo de' Medici, Ficino's contemporary. Also evident here is how much the impression of the senses, conveyed through the media of art, now comes to the fore in the assessment of beauty. In his commentary on his own sonnets, Lorenzo lists three kinds of beauty: inner beauty (*la mente, la quale ha per obietto la bellezza dell'anima*), the beauty of the body (*bene proporzionato, di grazioso aspetto*), and that of the voice (Medici, Lorenzo de' 1992; Summers 1981, 371). He declares that, while inner beauty arises from virtue, and the beauty of the voice is based on the harmony of polyphony (*consiste quando di più voce concordi risulta un concerto*), for the body, beauty lies in good proportions. He adds, however, that the grace and lightness (*venusta ed leggiadria*) that emanate from the body are crucial, since beauty sometimes pleases "not so much because of the perfection and good proportion of the body, as because of a certain conformity that it has with the eye to which it is pleasing, that proceeds from heaven and from nature" (ibid; see also p. 372, for Aristotle's quotation of Plato, *Hippias Major*, 298a: "The beautiful is that which gives pleasure through hearing and sight").

At the beginning of the Renaissance, then, there were not only "objective," that is, heavenly, concepts of order but also criteria of perception that Lorenzo de' Medici prioritizes over perfect, absolute proportions. It is this concept that, in an encyclopedia of philosophy, allows for a consideration of the Renaissance idea of beauty from the perspective of its production and reception. With an emphasis on the eye and ear as organs for the perception, as well as the knowledge, of beauty, the arts come to the fore as media for the appearance of beauty.

Indeed, one of the most important objectives of art in the Renaissance was the representation of beauty. How beauty should be defined, however,

and where it can be found have been the subject of lively discourse since at least the fifteenth century. At this point, beauty was still fundamentally bound to notions of order and harmony, which is why the formation of proportion theories continued to hold currency in discussions on beauty. Famously, Albrecht Dürer (1471–1528) made studies of proportion in order to find the perfect human form (Dürer 2003; Andrews 2016). At the same time, nevertheless, attempts to construct absolute standards by means of rules that could be learned were no longer universally convincing. In his treatise on painting, *De pictura*, of 1435, Leon Battista Alberti (1404–1472) took a different route and associated beauty with composition. He applied the concept of *concinntas*, which was used by Cicero in association with beautiful wording, to painting, and explained that what is called beauty becomes visible in good compositions: "From the composition of the surfaces arises gracefulness in the bodies, which is called beauty" (*Della pittura*, §35; Alberti 2000, transl. E.Oy-Marra). While Cicero understood the term *concinntas* as the construction of a beautiful sentence and assigned to this *ornamentum* the adjectives *elegantia* and *suavitas*, Alberti adopted only the adjective *elegans*, which he added to *grazia*, declaring *concinntas* to be one of the most important conditions for beauty. A more thorough explanation of *concinntas*, however, first appears in Alberti's architectural treatise, *De re aedificatoria* (Poeschke 1985, 47–49), in which he dedicates an entire chapter of the ninth book to the concept. In this text, *concinntas* now encompasses number (*numerus*), outline (*finito*), and position (*collocatio*), which Alberti employs in his attempt to describe the concept's laws. In the sixth book, he already differentiates between *pulchritudo* and *ornamentum*, subordinating the latter to beauty. For Alberti, however, *concinntas* was a principle (*ratio pulchritudinis*) that could be discerned through reason and should not be left to opinion (*opinio*). He was not interested, therefore, in individual beauty, for which a judgment could be a matter of opinion. Rather, the concept of *concinntas* was directed at a beauty superior to individual differences and inherent in all living beings, which could only be discerned through

innate reason (*ratio*). With this concept, Alberti essentially designated the goal of architecture to be the imitation of nature.

When Alberti declared the imitation of nature to be the most important rule in art, however, the participation of art in the idea of the beautiful became a theoretical problem, in so far as this could only be achieved if the imitation of nature was oriented toward the divine concept of nature, which did not reveal itself in all of its visible forms. Bound to the imitation of nature, art must be produced and re-designed according to God's model (Blumenberg 1996; Flasch 1965; Leinkauf 2005; Moritz 2010). According to the understanding of the time, then, beauty was fundamentally unavailable and could be discerned only where it manifested itself in nature or where it was revealed to the elect. In the Renaissance, the arts were first and foremost tasked with the discernment of beauty and with making that beauty visible. But how could this task be completed if visible nature no longer represented divine order in all its manifestations? In the epoch's literature on art, many writers never tired of emphasizing the need for artists to maintain a selective and discerning eye in their observations of nature.

Alberti's approach to beauty is well illustrated by a popular anecdote recounted by Pliny the Elder in his *Natural History* (XXXV.64; Pliny the Elder 2014), as well as by Cicero in *De inventione* (II.i.1). In this narrative, the painter Zeuxis, faced with the task of painting Helen of Troy, the most beautiful woman on earth, realizes that no mortal woman could possibly serve as his model. He then asks the five most beautiful women from ancient Croton to stand before him, and he selects the most beautiful of each of their body parts, combining them in his painting of the beautiful Helen (Sammern and Saviello 2019, 39–48).

This anecdote, which Alberti included in *De pictura* (§ 56), composed in 1435, describes the pains a painter must take in order to represent beauty at all: he must first discern and select the beauty of nature, which appears only in individual fragments, and then assemble his choices coherently. It is only logical that Alberti drew on the anecdote of the virgins of Croton at the point at

which he offered instruction on nature studies. He was not concerned with painting precisely what he saw, unlike the ancient Greek painter Demetrios, who, according to Alberti (*De pictura*, §55), was “more inclined to imitate natural things than to make them beautiful.” Alberti, instead, emphasized the difficult task of identifying the “notion of beauty,” which “even the well-trained can scarcely discern” (Alberti 2000, 157; trans. S. Luther). In doing so, he introduced the Platonic idea of beauty, which subsequently gained great significance during the Renaissance, into the literary discourse on art (Panofsky 2008). However, by linking the knowledge of the idea of beauty and the study of nature, Alberti also associated the notion of beauty – which necessarily surpasses nature – with an Aristotelian grounding of all knowledge in sensual experience (Summers 1981, 188–189; Kurbjuhn 2014, 83–85). He thus laid the foundation of the *Idea del bello* as the objective and guiding principle of art. This perspective resonated in Renaissance writings on art through to Giovan Pietro Bellori's (1613–1696) discourse on the *Idea del pittore, cello scultore e dell'architetto. Scelta dalle bellezze naturali superiore alla Natura*, which was delivered as an address to the Roman Academy of St Luke in 1664, was then published as paratext to the *Vite de' pittori, scultori e architetti moderni* (Bellori 1672/2009; Wohl et al. 2005; Panofsky 2008; Bellori 2018). Alberti's distinction between the pure observation of nature and the knowledge of beauty through selective and discerning study had an enormous impact. It is no coincidence that Giovanni Battista Agucchi (1570–1632), who composed a painting treatise between 1607 and 1615, referred to the passage from Alberti's treatise (Mahon 1947, 242). Bellori, on the other hand, underscored the formation of the notion “una certa idea” by invoking a letter attributed to Raphael (1483–1520) and addressed to Baldassare Castiglione (1478–1529), which states: “Per dipingere una bella mi bisognerebbe vedere più belle, ma per essere carestia di belle donne, io mi servo di una certa idea che mi viene in mente” (“In order to paint a beautiful woman, I need to see many beautiful women; but, due to a shortage of beautiful ladies, I make use of a certain

idea which comes into my mind”: Bellori 1672/2009, 17; Shearman 1994).

While Alberti essentially linked the knowledge of the notion of beauty to a study of nature refined by discernment, Michelangelo (1475–1564) argued for the role of divine providence, since, according to him, only those who were born to be artists could participate in the grace, the *grazia*, of God, which is, in turn, a requirement for the knowledge of beauty. For Michelangelo, then, *grazia* and inspiration were available only to the genius. Notably, he referred to the notion of *furor* and inspiration, which had their origins in Plato and featured in the Neoplatonism of Ficino (Summers 1981, 189 and 60–70).

Impact and Legacy

The Neoplatonic definition of beauty, strengthened by Michelangelo as well as by Vasari's (1511–1574) concept of *disegno* (Kemp 1974; Roggenkamp 1996; Kurbjuhn 2014, 72–75), was brought to a new level in the *Dialogue on Painting*, which the Venetian Lodovico Dolce (1508–1568) published in 1557, just 7 years after the publication of the first version of Vasari's *Lives* in 1550 and a year earlier than the second edition of the *Lives*. While Dolce also advocated the necessity of a selective imitation of nature in the sense of the Zeuxis narrative, he decisively associated beauty with perception. In Dolce's *Dialogue*, the Venetian Pietro Aretino (1492–1556) serves as the author's mouthpiece and attempts to persuade the Florentine Giovan Francesco Fabrini to accepting his perspective on art. For Aretino, it is not only a matter proving the superiority of Venetian painting by citing the example of Titian (1488–1576); but also, by juxtaposing Michelangelo and Raphael, he presents a concept of painting in which achievement lies beyond measurable categories. Drawing on a detailed discussion of the three components of painting – *invenzione*, drawing, and color – Aretino concludes that Michelangelo, whom Fabrini admires in all media, is only truly exceptional at drawing. He further argues that Raphael, on the other hand, not only excels in all three components of painting but also displays an element that,

according to Pliny, Apelles also possessed: “charm (*venustà*), that is, that indefinable presence (*quel che non so che*) which customarily proves so attractive with painters no less than with poets, operating in such a way that it fills another person with infinite delight, without his knowing from what quarter this element comes, which afford us so much pleasure” (Roskill 2000, 175). For Aretino, this *non so che* is the element that likewise surpasses *invenzio*, *disegno*, and *colorito* and is capable of generating infinite pleasure. Having provided this description of a conceptually indeterminate impression, which from this point becomes the topos of the unutterable, Aretino then identifies the true perfection that he believes can be seen in Raphael's works, dismissing the question of measurable – and therefore verifiable – beauty repeatedly raised by his interlocutor Fabrini. Although Aretino also acknowledges the beauty in the proportions of the human body, it is this *non so che* that accompanies the adjectives of *grazia*, *leggiadria*, and *facilità* and evokes painting's power to enable participation in divine perfection and its beauty (Cropper 1995).

In Dolce's notion of the *non so che*, a particularly important role is played by the quality of *grazia* attributed to Raphael's paintings. Vasari would claim *grazia* for the *maniera moderna*, and his discussion of it ultimately culminates in Raphael in the second edition of his *Lives* (Krüger 2016, 79–94). Dolce, for his part, traces *grazia* to Raphael's outstanding use of color.

The accompanying indeterminacy – the *vaghezza* – with which Dolce characterizes Raphael's colors also indicates that the contours of significance, with respect to the linguistic identification of beauty, were now dissolving toward the indefinite (Rhein 2008, S.303 und 305; Krüger 2016, 90–94). With the concept of *grazia* and the closely associated *vaghezza*, “the expressive form of non-conceptuality,” in Klaus Krüger's formulation, entered the theoretical discourse on art. This dimension of the “unapproachable, unobtainable” connotes the structure of its “aesthetic mediatedness,” which allows beauty to be experienced only through the longing gaze (ibid., 62). Crucially, Dolce turned the *non so che* into an experience of the indeterminate within the viewer.

By locating the purpose of painting in the arousal of pleasure, he explicitly introduced reception into the discussion. He did not, however, propose a relative, subjective understanding of beauty. When using the category of pleasure as a guideline for the quality of a work of art, which Aristotle had claimed for imitation in his *Poetics* (1448b10–20), Dolce was by no means concerned with a superficial form of sensation. Although he claimed that every human being was capable of discerning beauty, since the eye cannot lie (Rhein 2008, 249), he defined true pleasure as that “which multiplies all the more often any human eye views it anew” (ibid., 283). Pleasure was also bound to the longing gaze, which was stimulated by the indeterminate beauty of the representation, its *vaghezza*. In his treatise on the beauty of women, published in 1542, Agnolo Firenzuola (1493–1543) had defined this as “alluring beauty,” which beguiles and initiates admiration and delight (Cropper 1976; Krüger 2016). By leaving gender determinants intentionally vague, however, Dolce extended his idea beyond a longing gaze directed only at the representation of beautiful women. It is certainly true that he preferred delicate bodies to definitively masculine ones, and he justified this preference by noting the greater difficulty of representing them. Yet while his interlocutor Fabrini understands delicate bodies as clearly female, Dolce’s spokesman Aretino points out that there are also men who are delicately built but who do not resemble women. Such men, he notes, can be found primarily among the nobility. His ideal, however, is the description of the beautiful female body in the Petrarchan tradition, which he invokes by beginning his treatise with Ludovico Ariosto’s verses describing the beautiful Alcina. Even if he stresses the diversity of beauty, it is clear that he is inclined to associate painting, which, unlike poetry, he regards as female, with beautiful women. But here, too, the boundary between beautiful painting and painted beauty is blurred. To the extent that Dolce refused to define gender identities according to clear physical characteristics, he destabilized the distinction between ideal female beauty and its representation in portraiture and the representation of natural beauty, thus undermining the distinction between object, art, and nature (Cropper 1995).

Although Aretino is able to persuade Fabrini to agree with him in Dolce’s treatise, Michelangelo’s own perspective continued to be advocated in Florence, even before Vasari ultimately anchored it in his *Life* of the Florentine artist in 1568. In his *Trattato delle perfette perfezioni*, composed in 1563, the sculptor Vincenzo Danti (1530–1576) did more than merely affirm the Neoplatonic understanding of art and stress the necessity of being born an artist (Danti 1960, 268) in order to create the perfect form that nature intended: “si camina all’operazioni dell’imitare e si crea nella mente nostra la perfetta forma intenzionale della natura” (by means of the operation of imitation we create in our mind the perfect intentional form of nature; ibid., 265; transl. E.Oy-Marra). For the first time, he also discussed the question of the temporal bondage of the human body – and thus the question of whether an old body could be beautiful, without, however, differentiating between the sexes. Unlike Dolce, he seems to have been concerned only with the male, virile ideal of beauty, referring to the triad of youth (*gioventù*), manhood (*virilità*), and old age (*vecchiezza*). Under the theoretical premise of a nature whose intentionality appears only in fragments, he explained that although a man was beautiful at any age, such beauty manifested itself primarily in the youthful body. Unlike Dolce, Danti did not reject aesthetic mediatedness as a condition for the perception of beauty. Though this was tied to conditions of the medium, Danti was more interested in the definition of the ideal subject, which was, in turn, associated with ancient prototypes. In the process, however, a fundamentalist conceptualization of beauty entered the discussion. This conception has been commonly traced back to the beauty of antique sculpture. According to Ernst Gombrich, our ideals of beauty are still informed by antique statues (Cropper 1995). Bellori, in his *Lives*, published a copper engraving of the ancient statue of Antinous (Bellori 1672/2009, 474–477) created by Charles Errard (before 1607–1689) in 1672, which was thought to illustrate the taste of the author; in his *Idea*, however, he expressed the notion of a multiple beauty already present in the ancient sculpture: “Now the idea of the beauty is not one, its forms are various, both strong and magnanimous joyous and

Beauty, the Renaissance Idea of, Fig. 1 Cesar Ripa, *Iconologia overo Descrittione di diverse imagini cavate dall'antichità e di propria inventione*, Roma: Lepido Facii, 1603

delicate of every age and each sex” (Wohl et al. 2005, 60). Eleven years later, Gérard Audran published a Treatise on the proportions of the most beautiful figures with all necessary measurements in order to instruct artists (Audran 1683; Sammern and Saviello 2019).

The attempt to define the laws of beauty and establish norms certainly did not come to an end in the Renaissance and remain influential today in the beauty industry, which changes its standards at increasingly short intervals; however, the Renaissance’s real contribution to the debate on the determination of beauty lies in the aesthetic mediatedness of beauty and its fundamental indeterminacy. An embodiment of the extent to which this indeterminacy entered the public domain can be seen in Cesare Ripa’s (1560–1622) description of the

personification of *Bellezza*, whose pictorial representation in the 1603 edition of the *Iconologia* shows a nude woman with her head enveloped in clouds (see Fig. 1). In an explanatory statement, Ripa writes: “she is painted with her head in the clouds, for beauty cannot be spoken of with mortal tongue or human intellect, as it is nothing but the divine splendor of light that radiates from the face of God” (Ripa 1603, 40–41).

Beda, Noël

Born: c. 1470

Died: 1537

James K. Farge

Pontifical Institute of Mediaeval Studies, Toronto, ON, Canada

Abstract

Noël Beda (c.1470–1537), syndic of the Faculty of Theology of Paris, was the leading polemicist in France defending the university's scholastic curriculum against humanism and fighting to curtail the nascent Protestant Reformation. His opposition to several policies of King Francis I, however, resulted in his eventual arrest. He died in prison in 1537.

Biography

Noël Beda (c.1470–1537) – theologian, university administrator, and polemicist – was born probably in Picardy (northern France). After nearly 20 years of study at the University of Paris in logic, ethics, scholastic theology, and Sacred Scripture, he received the prestigious Paris doctorate in theology in April 1508 (Farge 1980). At first a college administrator, he would later become one of the leading defenders of the

university's scholastic curriculum and of the traditional Catholic faith against the inroads of Lutheranism and later forms of Protestantism.

Beda's earliest involvement in these issues occurred with two books written (1519–1520) against certain biblical interpretations of the “theologizing humanists” Jacques Lefèvre d'Étaples and Josse Clichtove (Crane 2005). In 1520, sensing much greater danger in the writings of Martin Luther, he persuaded the Paris Faculty of Theology to revive the office of syndic, an office he held from 1521 to 1534, using it against the humanists and religious reformers. Because both movements appeared in Paris at about the same time, Beda saw them as working hand-in-hand. In turn, humanists and religious reformers held Beda in contempt. The criticism and satire of humanists like Erasmus of Rotterdam and François Rabelais, as well as Beda's own intransigence in certain political matters, led to his eventual public disgrace, exile, and imprisonment.

Beda's theology relied on the conviction that, from the beginning of Christianity, God's Spirit was an active, indwelling presence in the Church and the world. For him, this implied the duty of theologians to profess, defend, and pass on from one generation to the next a continuity of dogma, moral teaching, liturgical rites, and popular devotions. Any opposition to those ideals, he concluded, had to be defeated (Farge 2008).

Particularly abhorrent to Beda was the humanists' practice of submitting the Latin Vulgate biblical texts to philological probing and advocating their translation into vernacular languages. Beda believed that the former was not only blasphemous but would also lead to textual corruption, and he held that translating the Bible into vernacular languages would result in conflicting interpretations, giving rise to schisms and sects in Christendom.

Among Beda's early targets was the circle of humanist preachers whom Bishop Guillaume Briçonnet had gathered to help reform the Church in his diocese of Meaux (Farge 2015). He also maintained a 5-year-long suit in the Parlement of Paris against his fellow theologian Jacques Merlin who had published an *Apologia* for the early exegete Origen, some of whose ideas had been

condemned by the Second Council of Constantinople (553) (Farge 2015).

Erasmus of Rotterdam, the leading humanist in Europe, was one of Beda's strongest opponents. Their exchange of letters reveals much of Beda's antipathy towards humanism and elucidates Erasmus' defense of it (Nauert 1994, 2003; Farge 2010). In 1525, Beda published his *Annotationes* in which he declared 562 propositions from works of Lefèvre d'Étaples and Erasmus to be dangerous – some even heretical. At Beda's direction, the University of Paris censured several of Erasmus' works (Farge 1990). Erasmus in turn wrote five books against Beda and his Faculty of Theology (Rabbi 2013).

In the 1520s, Beda was often a critic of King Francis I's tolerant policy towards humanists and some religious reformers. In 1530, he strongly opposed Francis's support for Henry VIII's campaign to obtain an annulment of his marriage to Catherine of Aragon. The king intimated at that time that Beda would face consequences for his opposition, but this did not keep Beda from later accusing a favorite preacher of the king's sister Marguerite of Navarre, Gérard Roussel, of heresy (Farge 1985). In 1534, he brought suit in the Parlement of Paris charging that the king's *lecteurs royaux* appointed to teach Hebrew and Greek were criticizing the Vulgate text of the Bible. Although the Parlement favored Beda, the king's Privy Council allowed them to continue (Farge 2015).

Shortly thereafter King Francis arrested Beda. He was made to appear barefoot in public, to witness the burning of his papers, and to ask pardon for his errors and his actions against the king. He was imprisoned in the abbey of Mont-Saint-Michel where he died 18 months later in ignominious circumstances (Gout 1910).

Historians whose predilection for humanism or for the Protestant Reformation have often pictured Beda as an ignorant madman opposed to any change or reform in the university or in the Church. But Beda had significant support from the Parlement of Paris (the Supreme Court in France), from many influential laymen, and from certain bishops who wanted to promote an intellectual and institutional renewal that would

sustain a reformed Gallican Catholic Church based on traditional scholastic theology.

Humanism eventually earned wide acceptance in French intellectual life, and, after nearly four decades of religious war, French Protestants were granted a limited form of toleration in 1598. It can nevertheless be argued that Beda's early and staunch defense of traditional theology and devotion – decades before the Council of Trent – helped keep the greater part of France in the Catholic fold.

Bellarmino, Roberto

Born: 1542

Died: 1621

Franco Motta

Dipartimento di Studi storici, Università degli Studi di Torino, Turin, Italy

Abstract

Roberto Bellarmino (Montepulciano, Siena, 1542–Rome, 1621), Jesuit and cardinal, was among the leading theologians of the Counter-Reformation. A specialist in controversialist theology, he taught at the Roman College of the Society of Jesus and then had his lectures printed as his main work with the title *Disputationes de controversiis* (1586–1593). Appointed cardinal in 1599, he acted as adviser in theological matters to Popes Clement VIII and Paul V, resulting decisive in preventing an official condemnation of Jesuit Molinist theology in the controversy on grace with the Dominican Order. As a member of the Congregation of the Index and the Holy Office, he played a key role in the affairs of Francesco Patrizi's Platonism, the condemnation of Copernicanism, and of Giordano Bruno's trial. Bellarmino's fame is mostly associated with the theory of the *potestas indirecta in temporalibus*, "the indirect power of the popes over temporal matters," a theory he defended in the *Disputationes* and in later polemics with Anglican and Gallican theologians.

Alternate Names

[Bellarmini, Roberto](#) [Francesco Romolo](#);
[Bellarmino, Robert](#)

Biography

One of the most influential theologians of the Counter-Reformation, Bellarmino (born Roberto Francesco Romolo Bellarmini, latinized as Bellarmino, Montepulciano, Siena, 4 October 1542–Rome, 17 September 1621) entered the Society of Jesus in 1560, mostly as a consequence of the close relationship between the order and his uncle Marcello Cervini, who held the office of pope for a brief 22 days (April 1555) under the name of Marcellus II.

Bellarmino's preaching in Latin was so effective that General Francisco Borja chose to send him to Leuven, in Flanders, the hub of dissemination for Catholic culture in the Southern Netherlands, before he had even finished the *cursus* to earn the degree in theology. The Jesuit resided there from 1569 to 1576, alternating between preaching and lecturing on Thomas Aquinas' *Summa Theologiae*. These years spent in a borderland between Catholicism and Calvinism were fundamental to Bellarmino's intellectual development, as a result of his contact with reformed theology and radical Flemish Catholic Augustinianism, as well as for the peculiar doctrinal tone he granted to his sacred rhetoric: indeed, more than one of his homilies took on the air of veritable lessons in Tridentine dogmatics, shaped on the basis of the methodological legacy of Melchor Cano's *De locis theologicis*.

After returning to Rome, Bellarmino was given the chair of controversialist theology at the Collegio Romano, a position he occupied until 1588; the classes he held there went on to form the backbone of his most famous enterprise, the *Disputationes de controversiis christianae fidei adversus huius temporis haereticos* (first edition Ingolstadt, 1586–1593). This huge work, which enjoyed multiple reprints and an extraordinarily long-lived success, can probably be qualified as the most exhaustive compendium of Tridentine orthodoxy, articulated through an intense dialectic between the Catholic and heretical thought that runs through all the matters of faith, from biblical hermeneutics to ecclesiology, from theological anthropology to Christology, and from sacramental to liturgical questions.

Bellarmino's work as a doctrinal expert peaked under the reign of Clement VIII – who appointed him to draft the official Catechism of the Catholic Church and elevated him to the rank of cardinal (1599) – as well as that of Paul V. His appointment in the commission charged with solving the controversy on grace and free will that opposed Jesuit Molinist theologians, and the Dominican Order was decisive in preventing an official condemnation of his own order.

Sponsored by the Society of Jesus as early as 1622, his process of canonization was interrupted multiple times precisely because his name was associated with the thesis asserting the absolute primacy of the Roman See over the council and matters of temporal power; the process was finally concluded three centuries later (canonized in 1930; declared Doctor of the Church in 1931).

Impact and Legacy

Bellarmino's fame remains historically associated with his thesis regarding the Roman pontiff's indirect sovereignty over civil authority (*potestas indirecta*), which represented the theoretical cornerstone of the papal project to gain a worldwide ideological and political hegemony at the turn of the sixteenth century. This theory triggered long polemics throughout the European confessional context, which witnessed Bellarmino defending it against Anglican and Gallican theologians in his *Tractatus de potestate Summi pontificis in rebus temporalibus* (1610).

Bellarmino's work as part of the Congregation of the Index and the Holy Office intersected with some of the most significant theological and philosophical themes of the first two decades of the seventeenth century. He played a key role in multiple cases: his opinion regarding Francesco Patrizi's Platonism turned out to be decisive – indeed, he explicitly warned Clement VIII of its inherent dangerousness; in the inquiry mounted against Giordano Bruno, Bellarmino managed to unblock the process by extrapolating, from the philosopher's writings and the records of the process, the eight specific instances of unquestionable heresy that the accused was then asked to

recant; finally, he was decisive in ascribing a status of heterodoxy to Copernican theory, which Bellarmino had come to know by reading Paolo Antonio Foscarini's *Lettera sopra l'opinione de' pittagorici* and, almost certainly, Galileo Galilei's Letter to Christina of Lorraine as well. In relation to Copernicanism, Bellarmino introduced the idea of a distinction between the true nature of revealed knowledge and the hypothetical nature of experimental knowledge, a principle that continues to underlie Catholic interpretations of the relationship between science and faith even today.

Belli, Pierino

► [Belli, Pietrino](#)

Belli, Pietrino

Born: Alba, 1502

Died: Turin, 1575

D. L. Dusenbury

De Wulf-Mansion Centre, Institute of Philosophy,
Catholic University of Leuven, Leuven, Belgium
Philosophy Department, Loyola University
Maryland, Baltimore, USA

Abstract

Pietrino Belli was a jurist of the Piedmont. He served Philip II of Spain as a counselor of war and Emmanuel Philibert of Savoy as a counselor of state. He wrote a significant treatise on the laws of war and the restoration of peace, *De re militari et bello tractatus* (1563).

Alternate Names

[Bellus, Petrinus](#); [Belli, Pierino](#)

Biography

Pietrino Belli was born in 1502 in the Piedmontese city of Alba. His family belonged to the city's minor nobility, and Belli affixed the name of Alba to his own. In Latin, he is *Petrinus Bellus, Albensis*. Nothing definite is known about his

youth. There is reason to believe that he read Roman law – and perhaps, canon law – at the University of Perugia. Two of Europe's most commanding fourteenth-century legists, Bartolus of Sassoferrato and Baldus de Ubaldis, taught in Perugia. Predictably, both rank among Belli's supreme legal authorities.

Belli seems to have been marked out from the age of thirty-three as “a man of high affairs” (Vernazza di Freney 1783, p. 8). In 1535, he was made a military judge (*auditor di guerra*) in the imperial forces of Charles V. After the emperor's death, Belli was made a counselor of war (*consigliere di guerra*) by Philip II of Spain. This office brought with it a lordly income – 400 crowns per annum – that he presumably drew from that point onward.

Belli himself notes that in the year 1558 (though he likely means 1559), he was writing *A Treatise on Military Matters and Warfare in Eleven Parts* (*De re militari et bello tractatus, divisus in partes XI*). Thus, scholars roughly date the work's composition to 1558 and 1559. It is Belli's only systematic work, and its massive alphabetical index (*index rerum*) suggests that he meant for jurists to consult it in the course of their duties (Gaurier 2007, pp. 3–4). The work appeared in 1563 with a Piedmontese printer in Venice, Franciscus de Portonarijs. It bears a dedication to Philip II, whom Belli hails as “the only hope of the Christian world” (*spes unica Christiani orbis*).

With the Peace of Cateau-Cambrésis (1559), Henry II of France ceded the Piedmont back to its hereditary ruler – Emmanuel Philibert, the Duke of Savoy. In 1561, Emmanuel Philibert invited Belli to serve him as a counselor of state (*consigliere di stato*). Belli held this office for the rest of his life, and a number of the legal opinions he wrote in this time were printed in sixteenth- and seventeenth-century collections of *consilia*. He died in Turin in 1575, and in 1589 his bones were reinterred in a chapel of the cathedral of Asti.

Impact and Legacy

Belli's treatise on the laws of war, *De re militari et bello tractatus*, is important for its systematic

examination of most of the issues that come to the fore in texts written by the canonical early modern jurists, Alberico Gentili and Hugo Grotius. Of special note are Belli's handling of the origins and definition of war (part I), of the just (and unjust) causes for declaring war (part II), of war crimes and their punishments (part VIII), and of the restoration of peace (part X).

It is hard to determine the extent of the direct influence of Belli's treatise. The Hispano-Flemish jurist Balthasar de Ayala seems to have used Belli extensively when writing his own treatise, *De iure et officiis bellicis et disciplina militari* (1582); but Ayala only cites Belli twice. Alberico Gentili refers to Belli, in passing, in his *Encomiums to the Universities of Perugia and Oxford* (*Laudes Academiae Perusinae et Oxoniensis*, 1605); but he fails to mention Belli in the first pages of his magnum opus, *On the Law of War* (*De iure belli libri tres*, 1588). Perhaps due to this slight by Gentili, Belli tends to be forgotten by historians of Renaissance philosophy.

Petrino Belli is a fine exemplar of a late medieval style of juristic reasoning which is open to humanistic influences and which is beginning to grapple with the dissolution of the medieval *res publica Christiana* and the rise of sovereign states in Europe.

Bembo, Pietro

Born: Venice, 20 May 1470

Died: Rome, 18 January 1547

Marco Faini

Department of Philosophy and Cultural Heritage,
Ca' Foscari University of Venice, Venice, Italy

Abstract

Pietro Bembo was a humanist, writer, and poet. The author of the *Prose della volgar lingua* (1525), a work that set the standard of written Italian for the centuries to follow, he was also the editor of fundamental editions of Petrarch and Dante. A refined Latin poet as well as the

official historian of Venice, Bembo contributed to spreading Neoplatonic ideas on beauty and love, especially through his vastly successful dialogue known as *Gli Asolani* (1505).

Biography

Pietro Bembo was born in Venice, the scion of Bernardo, a humanist, collector of antiquities, and civil servant of the Most Serene Republic (Giannetto 1985; on the collection of Bernardo and Pietro Nalezty 2017). Bernardo was a friend of the Florentine philosophers Marsilio Ficino and Cristoforo Landino, among others (on Bembo's biography see Dionisotti 1966; Kidwell 2004). From his early youth, Pietro accompanied his father on embassies to Florence, where he became acquainted with the Medici family – especially Lorenzo il Magnifico – as well as with the most influential humanists of the time. Although very young, he developed long-lasting relationships with Florentine intellectuals. At the same time, he studied with the humanist Giovanni Aurelio Augurello, a scholar of Petrarch and the author of a Latin poem entitled *Chrysopoeia* (1515).

Bembo's philosophical background was also influenced by his studies, from the mid-1490s, of philosophy at the University of Padua with Niccolò Leonicensi, whom he later followed to Ferrara. The Paduan Aristotelian tradition influenced Bembo who, in 1516, intervened in defense of Pietro Pomponazzi and his work *De immortalitate animae*, possibly saving Pomponazzi from an inquisitorial intervention (Perrone Compagni 2015, 708).

From 1492 to 1494, Bembo studied Greek at the school of Costantino Lascaris in Messina. Upon his return to Venice, he published Lascaris's Greek grammar. This was the beginning of his cooperation with the publisher Aldo Manuzio, with whom he printed his Latin dialogue *De Aetna* (1496), where he recounts an ascent of the Sicilian volcano (Williams 2017). The work is interspersed with classical reminiscences and naturalistic notions and observations. It was with the two editions of Petrarch's *Rerum vulgarium fragmenta* (1501) and

Dante's *Divine Comedy* (1502) that Bembo achieved wide renown. However, Bembo was and remained more of a philologist than a philosopher. It was not until 1505 that Bembo published *Gli Asolani*, perhaps his most successful work alongside the *Prose della volgar lingua* (1525) and his *Rime* (1530). The first work stages a dialogue on the nature of love: divided into three days, it is set in Asolo, in the Veneto, at the court of the Queen of Cyprus, Caterina Cornaro. The dialogue – a combination of prose and verse – is heavily influenced by Neoplatonic theories. While the first speaker, Perottino, complains about love, the second speaker, Gismondo, describes love as a force “which promotes the civility of both individuals and groups” (Raffini 1998, 69). The third speaker, Lavinello, explains love in properly Neoplatonic terms, as a desire of beauty that leads to God. A fourth character, a Hermit, intervenes in the work, presenting a different conception of love as completely detached from the senses and from earthly entities, which are but a pale reflection of the celestial world. Bembo expresses his ideas on love also as a character in the fourth book of Baldassare Castiglione's *Book of the Courtier* (1528), taking a more orthodox Neoplatonic position. Bembo's speech in Castiglione's text is “full of deep religious feeling but none of it is specifically Christian or Catholic” (Hankins 2002, 387).

In giving voice to the Hermit, Bembo was perhaps voicing here the aspirations for a renewal of the Church that were very much alive within his circle, the so-called *Compagnia degli amici* (Company of friends), and especially among Vincenzo Querini and Tommaso Giustinian. In 1513, these latter wrote a *Libellus ad Leonem X* concerning a reform of the Church. They both chose the hermitic life and suggested to Bembo that he follow their path. While he did not do so, he later embraced an ecclesiastical career and was appointed cardinal in 1539. It is difficult to ascertain the extent to which Bembo was involved in the harsh religious struggles of his time. Yet, Bembo remained close to some of the main protagonists of Italian evangelism, such as Vittoria Colonna, Jacopo Sadoletto, Vittore Soranzo, Benedetto Varchi, Ludovico Beccadelli, Aonio

Paleario, and many others. From 1542 to 1547, he was also cardinal protector of the Cassinese Congregation, which belonged to the Benedictine order actively involved in the discussion on salvation through Grace and through works.

Impact and Legacy

In general, Bembo's most significant contribution to Italian culture should be identified in his elaboration of a language based on the imitation of the great fifteenth-century works of Petrarch and Boccaccio (Patota 2017), and in his poetry, based on a strict imitation of Petrarch's style. A major exhibition dedicated to Bembo's life and work was mounted in Padua in 2013 (Beltramini et al. 2013)

Benci, Francesco

Born: 1542, Acquapendente

Died: 6 May 1594, Rome

Lorenzo Filippo Bacchini

Department of German and Roman Languages and Literatures, John Hopkins University, Baltimore, MD, USA

Abstract

Francesco Benci (1542–1594) was an Italian humanist, poet, and professor of Rhetoric, Jesuit since the 1562. He studied in Rome under the supervision of Marc'Antoine Muret and along his life he taught Rhetoric in Siena, Perugia, and Rome. He composed, in Latin, an epic poem (*Quinque martyres e Societate Iesu in India libri sex*), a work on Rhetoric (*De Stylo et Scriptione*), many orations (*Orationes*), lyrics (*Carminum libri quattuor*), and three allegorical dramas (*Ergastus*, *Philotimus*, *Elisaeus*). He also compiled and edited five volumes of the *Annuae litterae* of the Society of Jesus for the years between 1586 and 1591 and corresponded with some of the most important humanists of his time.

Alternate Names

Bencio; Bencius; Bentius; Benzi; Franciscus; François; Plauto

Biography

Francesco Benci was born in Acquapendente, in the province of Viterbo, in 1542, with the name of Plauto. After studying 7 years in Rome under the supervision of Marc'Antoine Muret, he pursued the study of Philosophy for 4 years and the study of Civil Law for 2 years. After his mother's death and a religious crisis, on 18 May 1562 he entered the Company of Jesus, changing his name to

Francesco, his father's name. After the novitiate, he started teaching and was Professor of Rhetoric in Siena, in Perugia, and especially in Rome, where he taught at the *Collegio Romano*, the most important Jesuit cultural center. He lived in Rome for the last 20 years of his life and knew and corresponded with some of the most important humanists of his time. He died on 6 May 1594 in Rome and was buried in the Church of the Society of Jesus (see Negri 1966; Sommervogel 1898; Tiraboschi 1805; Villoslada 1954).

Francesco Benci's literary production, completely in Latin, although diverse in content and genres, is a typical example of the counterreformist production and reflects the dialectic between Renaissance and Catholicism typical of the cultural climate of the time.

He composed lyrics (*Carminum libri IV*), including heroic verses, 20 odes, 9 hymns, 14 elegies, 29 epigrams, and 23 couplets; orations (*Orationes*), written for and with his students and characterized by great attention to the construction and the embellishment of the prose; and a work on Rhetoric (*De Stylo et Scriptione*), all published in Rome in 1590 and later published several times usually together (Ingolstadii 1592, 1599, and 1602; Coloniae Agr. 1617) (see Flamini 1903; Mazzuchelli 1760; Negri 1966; Tiraboschi 1805).

Benci also composed an epic poem (*Quinque martyres e Societate Iesu in India libri sex*), published in Venice in 1591. It was inspired by the real adventures of a Jesuit mission in India led by father Rodolfo Acquaviva which inspired many other works of the time and which also inspired Daniello Bartoli's famous *Missione al Gran Mogor* (1653). This work, in which Benci applied the precepts proposed to his students in *De Stylo*, can be considered the highest pick of his literary production (see Flamini 1903; Mazzuchelli 1760; Negri 1966; Tiraboschi 1805).

Less known are his allegorical dramas, which reflect the typical structure and dynamics of the Renaissance Latin theater. Two of them, *Ergastus* and *Philotimus*, were published in Rome and performed during the final ceremony of the *Collegio Romano* in October 1587 and in December 1590, respectively, and a third,

Elisaeus, remained instead in manuscript form, as did his notes and his comments on several Cicero's orations (see Mazzuchelli 1760; Tiraboschi 1805).

Finally, it is also worthy to mention his activity as a compiler and editor of five volumes of the *Annuae litterae* of the Society of Jesus between the years of 1586 and 1591, published in Rome between 1589 and 1594, and his preface to Giulio Cesare Stella's poem (*Columbeidos libri priores duo*), which he published in Rome in 1590 (see Negri 1966; Sommervogel 1898; Villoslada 1954).

Throughout his life he was involved in the humanistic cultural debate, frequenting and corresponding with some of the most important humanists of his time like Marc'Antoine Muret, Justus Lipsius, Piero Vettori, Cesare Baronio, Marco Antonio Bonciario, Paolo Sacrati, and Luigi Lollino, Bishop of Belluno, and most of his letters can be found in *Epistolarum M. A. Bonciarii libri XII* (Perusiae 1613) and in *Sylloges epistolarum a viris illustribus scriptarum* (Leydae 1727).

Beni, Paolo

Born: 1552–1553, Gubbio (Italy)

Died: 1625, Padua (Italy)

Lorenzo Sacchini

School of Languages, Cultures and Societies,
University of Leeds, Leeds, UK
Fredericksburg, USA

Abstract

Paolo Beni was an influential and controversial literary and philosophical theorist, whose main works were published in Italy in the first quarter of the seventeenth century. Born in Gubbio between 1552 and 1553, he entered

the Jesuit order in the early 1580s but was forced to leave in 1593. From 1600 to 1623, he taught at the University of Padua as Professor of Humanities and Rhetoric. He died in Padua in 1625.

Beni is best known for his *Anticrusca* (Paolo Beni and Giovanni Battista Martini, Padua, 1612b), a polemical pamphlet against the Accademia della Crusca's *Vocabolario*. Giovanni Alberti, Venice, 1612). His philosophical works deal with Aristotle's *Rhetoric* and *Poetics* (*In Aristotelis Poeticam commentarii*. In Beniana, per Franciscum Bolzettam, Io. Baptista Martino thypographo, Padua, 1613b; *In Aristotelis Poeticam commentarii*. Io. Guerilium, Venice, 1622a; *In Aristotelis libros Rhetoricum commentarii*. Io. Guerilium, Venice, 1624; *In Aristotelis libros Rhetoricum commentarii secundum, et tertium*. Io. Guerilium, Venice, 1625) and with Plato's *Timaeus* (*In Platonis Timaeum... ex typographia Gabiana*. Rome, 1594). His various interests also included the exegesis of Latin authors, the question of the usefulness of history, and religious matters.

Biography

Paolo Beni was born in Gubbio (Diffley 1983, 1988, 13) sometime between 1 October 1552 and 4 May 1553, most likely on 10 January 1553 (Diffley 1988, 15). His parents, of noble origin, had six children. From his youth, Beni had a very troubled relationship with his father, Francesco, and with his eldest brother, Giacomo. In the late 1550s, he was sent to Rome to attend classes at the Collegio Romano. While his family wished him to study law in Perugia, he rebelled and studied philosophy and theology in Bologna (1566) and later in Padua (1573). Here, Beni published his first poetic compositions, joined the local Accademia degli Animosi (Sangalli 2016, 120), and obtained his doctorate in theology in 1576. Back in Rome in 1576, he served as secretary to Cardinal Cristoforo Madruzzo and developed a close relationship with the humanists Marc-Antoine Muret and Carlo Sigonio.

In May 1581, Beni entered the Jesuit novitiate at Sant'Andrea al Quirinale in Rome. He left Rome in 1587 and lectured in Padua and Milan at various times between 1587 and 1593. On 23 September 1593, Beni was expelled from the Jesuits as a result of his disobedience to the order's rules combined with his insatiable appetite for money (Diffley 1988, 38–39). Beni returned to Rome between late 1593 and early 1594 to lecture on natural philosophy at La Sapienza. In 1594, he published the first of three decades of his commentary on Plato's *Timaeus* (*In Platonis Timaeum*. . . , Rome), aimed at restoring the original Platonic theories and freeing them from Neoplatonic interpretation. This exegetical work was followed by other minor literary compositions intended to obtain Papal favor (*De ecclesiasticis Baronii*. . . *disputatio*, Rome 1596; *Discorsi sopra l'inondation del Tevere*, Rome 1599).

On 3 November 1599, Beni was appointed Professor of Humanities and Rhetoric at the University of Padua, where he taught until at least November 1623. In March 1600, he delivered his inaugural university lecture (*De humanitatis studiis oratio*, Padua) and entered the local Accademia dei Ricovrati (Sangalli 2016, 121–123). In Padua, he devoted himself to university teaching, laying out an ambitious – though ultimately ignored – plan for the reform of the city university (Vatican Secret Archives, Vatican City, Archivio Beni, Quire 123), focused on both humanistic values and practical concerns (Sangalli 2001, 2016, 126–127). All his main works were composed during his mature years in Padua, where he died in 1625, sometime after August 1 (Diffley 1988, 116–117).

Beni is mainly remembered for his frenetic activity as a literary critic and polemicist. In 1600, he entered the debate on Giovan Battista Guarini's *Pastor fido* (Venice 1590) with two works backing Guarini's side (*Risposta alle considerazioni o dubbi dell'ecc.mo sig. Malacreta*. . . *sopra il Pastor Fido*, Padua 1600b; *Discorso nel qual si dichiarano e stabiliscono molte cose pertinenti alla risposta data a' dubbi e considerationi dell'eccellentissimo sig. dottor Malacreta*, Venice 1600c). The printing in the same year of his *Disputatio in qua ostenditur*

praestare comoediam atque tragoediam metrorum vinculis solvere (Padua), arguing against the use of verse in drama, stirred up a major controversy. In 1612, Beni cemented his reputation as a polemicist when he harshly criticized – in the *Anticrusca* (Padua 1612b; Padua 1613a) – the just-published *Vocabolario degli Accademici della Crusca* (Venice 1612). The vigorous negative response to the *Anticrusca* prompted him to publish *Il Cavalcanti* (Padua 1614) – a text supporting his previous work – anonymously. His position against the Accademia della Crusca, which omitted Torquato Tasso's works from its *Vocabolario*, is also well exemplified by his favorable commentary on Tasso's *Jerusalem Delivered* (*Il Goffredo*, Padua 1616), which complements his previous *Comparatione di Homero, Virgilio e Torquato* (Padua 1607; Padua 1612a). His exegetical works in the field of literature embraced Latin authors, such as Virgil (*In P. Virgilii Maronis Aeneidem commentarii*, Venice 1622c; Venice 1623) and Sallust (*In Sallustii Catilinariam commentarii*, Venice 1622d).

Beni's main contributions in the field of philosophy are his commentaries on Aristotle's works – which attracted a great deal of scholarship in the Renaissance – such as *Rhetoric* (*In Aristotelis libros Rhetoricum commentarii*, Venice 1624; *In Aristotelis libros Rhetoricum commentarii secundum, et tertium*, Venice 1625) and *Poetics* (*In Aristotelis Poeticam commentarii*, Padua 1613b; Venice 1622a), and his largely unpublished monumental commentary on Plato's *Timaeus*. His vast output also includes the discussion of religious issues (*Qua tandem ratione dirimi possit controversia*, Padua 1603) and a study on the utility of history (*De historia libri quatuor* [sic], Venice 1611; Venice 1622b).

Heritage and Rupture with the Tradition

In the *Anticrusca*, Beni quarrels with the Accademia della Crusca over two questions of literary tradition. First, he notes the continued evolution of the Italian language, reaching its ultimate perfection in the sixteenth and seventeenth century and not – as the Accademia della

Crusca claimed – at the time of the *Tre Corone*. Second, once more against the Accademia della Crusca, he disapproves of the canonization of certain fourteenth-century authors, such as Giovanni Boccaccio and, to some extent, Dante Alighieri, in favor of more modern sixteenth- and seventeenth-century authors.

Beni adopted a similar militant stance in his philosophical works. In his commentary on *Timaeus*, Beni argued against the Neoplatonic tradition over two key philosophical matters. First, Beni criticized Ficino's and Proclus's idea of *physis* that detached from Plato's original conception. In Beni's opinion, the subject of the *Timaeus* is the *universum* that embraces what is included within natural boundaries, and not the seminal force (or *vis seminaria*) as asserted by Neoplatonists (Bartocci 2010, 88–92; 2013, 200–201). Second, Beni proposed a rethinking of Ficino's idea of *prisca philosophia*. Although Beni acknowledged the derivation of Plato's theories from a more ancient tradition of knowledge, he confined it to pagan beliefs and separated it from Christian truths. Beni's aim in rediscussing the *prisca philosophia* is to preserve Platonic theories from a general misuse in treating theological matters and detach them from heterodox doctrines (Bartocci 2010, 95–108; 2013, 202–204).

Innovative and Original Aspects

Beni's thought allowed for a resurgence of Platonic theories over Aristotelian tradition at the time of Counter-Reformation. In his commentary on *Timaeus*, Beni intended to demonstrate the more rigorous adherence between Genesis narrative and Plato's natural philosophy compared to Aristotelian one (Bartocci 2013, 198–199). Beni also showed a high degree of receptivity to Galileo Galilei's theories. As two letters by Giovan Battista Manso showed (Galilei 1968, 291–296), Beni played an “active role in reporting the news concerning astronomical discoveries outside of Padua . . . [and] in detecting the new astronomical phenomena” (Bartocci 2016, 440–441).

There is no general consensus among critics and scholars on the evaluation of other aspects of

Beni's thought. While most Italian scholars stress the novelty of Beni's ideas in the fields of linguistics and philosophy, Diffley opted for a more nuanced interpretation of his works. When illustrating Beni's linguistic theories, Mazzacurati (1966) and Casagrande (1978, 1982) emphasized Beni's preference for art and artifice over nature, while Belloni (1922) stressed his anti-authoritarian tendency. By contrast, Diffley argued for Beni's predilection for a good balance of art and nature in linguistic matters and for his commitment to literary authorities (albeit other than the ones suggested by the Accademia della Crusca) in the shaping of his idea of language (1988, 143–146). Furthermore, analyzing his commentary on Aristotle's *Poetics*, Diffley provided a reassessment of Beni's supposed nearness to Baroque cultural tendencies, previously argued by Jannaco (1958) and Doglio (1973). According to Diffley, on the key issues of literary imitation and the purpose of poetry (utility vs. delight), Beni proves to be more classically inclined than traditionally thought and less open to modernity compared to *Cinquecento* commentators on the *Poetics*, such as Francesco Robortello or Ludovico Castelvetro.

Medieval Studies Department, Central European University, Budapest, Hungary

Abstract

Girolamo Benivieni was one of the most famous vernacular poets of his time. He is also known for his Dantean works, for his translations (especially from Latin into vernacular), and for his pious writings. Precocious member of the Florentine platonic Academy and intimate friend of the philosopher Giovanni Pico della Mirandola, he became one of the first supporters of the preacher Girolamo Savonarola, to whose legacy he remained loyal throughout his long life.

Biography

Born in Florence on 6 February 1453, Girolamo was the son of the notary Paolo and of Nastagia de' Bruni. Together with two of his siblings, the physician Antonio (1443–1502) and the philosopher Domenico (1460ca–1507), he rapidly became a prominent member of the Florentine intellectual society. A severe illness occurred in 1470 had compelled him to abandon ordinary studies, yet it did not prevent him from devoting entirely to the study of classics (Latin, Greek and also Hebrew) and of the modern Vernacular poets. It is on the latter's model that he earned a precocious fame in Lorenzo de' Medici's circle.

Moreover, his poetical qualities also fostered his success outside Florence, in other Italian courts, such as that of Giulio Cesare Varano in Camerino (Re 1906; Vasoli 1966).

His acquaintance with Giovanni Pico is probably datable to the latter's first visit to Florence in 1479. The friendship with the Count of Mirandola, with whom he shared literary interests and, later, a stern Savonarolan religious fervor, deeply marked Benivieni's life and character. From Pico's settlement in Florence in 1489 to the Count's death in 1494, the two lived a close and intimate friendship, which was best expressed by the intellectual gatherings in Pico's Florentine house and in the Dominican convent of San Marco and by the common charitable activity. Pico's premature death greatly upset Benivieni, who fostered the construction of his shrine in San Marco, which, almost half a century later, would also become his own, testifying, in death as in life, their intimacy (Re 1906; Vasoli 1966; Zorzi Pugliese 2003).

Another crucial encounter for Benivieni was the one with Girolamo Savonarola, of whom he was one of the earliest and closest supporters, converting his poetical skills to serve the moral and political reform of Florence. To Savonarola's memory, Benivieni will remain loyal long after the friar's death (Zorzi Pugliese 2015). The most visible effect of Benivieni's religious conversion was the disownment of his earlier poetical production, which he only partially later reacknowledged through a moralizing and christianizing self-commentary, published in 1500 and dedicated to Giovanfrancesco Pico (Benivieni 1500; Zorzi Pugliese 1994a; Roush 2002b). A number of the compositions which were not included in the self-commented collection have been preserved in manuscript and have recently been published (Leporatti 2008).

After the fall of the Florentine Savonarolan republic, Benivieni retired to private life, to his pious and literary works and to charitable activity. He maintained good relations with the Medici, at first with lower branches and later also with the ruling family. Despite the weak health which he lamented throughout his life, he lived to be almost ninety (Re 1906; Vasoli 1966).

His better known work is by far the *Canzona dell'Amor celeste e divino*, inspired by Ficino's commentary on Plato's *Symposion* and notably commented by Giovanni Pico (Garin 1942). Benivieni is also known for his intensive work as translator, especially from the Latin (but also from Greek and Hebrew) into vernacular, both prose and verse. The most relevant results of this activity are the translations of Savonarola's *Epistola dell'umiltà* and of the Penitential Psalms (Zorzi Pugliese 1994b, 2003). In the early years of the sixteenth century, he dedicated himself to the study of Dante, of which the most prominent result are the *Dialogo di Antonio Manetti circa el sito, forma et misure dello Inferno di Dante Allighieri* and the *Cantico in laude di Dante*, published inside the Florentine 1506 Giunti edition of the *Divine Comedy* (Roush 2002a). In 1519, the first edition of his *Opere* was published in Florence by Giunti (Benivieni 1519; Di Benedetto 2010). Almost immediate reprints were made in Venice, by Nicolò Zoppino in 1522 and by Gregorio de Gregori in 1524. This collection did not however include all of his works, but just those that Benivieni considered worthy of being diffused: the first edition of the *Canzona dell'Amor celeste e divino*, with Pico's commentary, the *Bucolica* dedicated to Giulio Cesare Varano (Battera 1990), his Dantean writing and some verse compositions.

The bibliography that follows only includes a selection of titles. Further references can be found in these works.

Benzi, Ugo

Born: 1376, Siena

Died: 30 November 1439, Ferrara

Coralba Colomba

Department of Humanities, Università del Salento, Lecce, Italy

Abstract

Ugo Benzi, a natural philosopher and a physician, was one of the most brilliant and appreciated professors of medicine of the fifteenth century. He spent much of his life at universities and courts of Northern and Central Italy. He studied philosophy at Florence and Pavia and medicine at Bologna. He began his teaching career at Pavia and died in Ferrara, as a private doctor of Niccolò d'Este. He wrote philosophical commentaries as well as medical treatises; nevertheless at his time he was a high-valued practice physician, sought after by the most important Italian universities and courts.

Biography

A natural philosopher and a physician, Ugo Benzi was born in Siena on 26 February 1376 from Andrea and Minoccia Pagni, in a bourgeois family. The discovering of the *Vita Hugonis* written by his son Soncino has allowed us to clarify details and episodes of Benzi's troubled life, even though it is important to acknowledge the eulogistic intent of his biographer. He started his studies in Siena and continued then in Florence and Bologna. Once left Bologna in 1394 due to a fracture with Piero Mantovano, he studied by himself and graduated at the University of Pavia presumably in *logica et philosophia* on 17 October 1396 (Lockwood 1951; DBI 1966; Lohr 2013). Afterwards, he taught logic at Pavia (1396–1399) and philosophy at Piacenza (1399–1402). In 1402, he retreated to the country by reason of the plague, and he began to study medicine. In

1402–1403 he taught philosophy at Bologna, while studying and later teaching medicine. In 1405 Benzi came back to Siena as professor of medicine and married Laia Sozzini (Lockwood 1951; DBI 1966). He had ten sons: Socino, Andrea, Francesco, Giovanni, Ludovico, Nicola, Carlo, Pietro, Lacopo, and Severo. In 1409 he left Siena and went to Pisa and then to Bologna as a doctor of the cardinal Baldassarre Cossa, reaching the chair of medicine *in nonis* until 1412. In the same year indeed called by Niccolò d'Este, Benzi moved to Parma in order to teach medicine, and there he spent four really productive years. He wrote three commentaries on Galen and also commentaries on the aphorisms of Hippocrates and on Avicenna. In 1416–1421 he taught at Siena and in 1422–1423 at Florence. Then he moved to Bologna, where in 1424 he and his family received the patent of Bolognese citizens. In 1425–1428/1429, he taught medicine at the University of Pavia hired by Filippo Maria Visconti. Later, called by Niccolò d'Este as a Court physician, he moved to Ferrara where he continued to teach privately, and Angelo Decembrio was among his students. These years were very prolific; he wrote different *consilia* (32, 19, 30, 17), and he reached the height of his fame. In May 1439 he visited Siena for the last time. He died in Ferrara on 30 November of the same year, and he was buried at the S. Domenico Church (Lockwood 1951; DBI 1966).

Benzi wrote a considerable number of both philosophical and medical works related to his teaching career. About the philosophical works, we know the commentaries to the Aristotelian *De somno et vigilia* (Benzi 1991) *De memoria et reminiscentia* and the commentary on the *Oeconomica* (Benzi 1992), all of them pseudo-Aristotelian works linked with his first teaching period in Bologna. Socino also mentioned in his *Vita* a treatise *De logicae artis ratione* which has been lost. His philosophical writings are not considered of particular value. It was undoubtedly his skills as a practice physician and medical scholar that gave him the reputation of being the most illustrious physician in Italy (Benzi 1992). Even though his thought is not particularly original, Benzi shows in his medical writings that he

knew deeply the Greek and Arabian medicine and that he had a great therapeutic experience (Lockwood 1951; DBI 1966).

Among his writing those extant today are the *Consilia ad diversas aegritudines* (Bologna 1492, Pavia 1496–1499, Venice 1518), *Expositio super Aphorismos Hippocratis et Galeni commentum* (Ferrara 1493, Venice 1498), *Expositio super libros tegni Galeni* (Pavia 1496, Venice 1498, 1518), *Expositio in primam et secundam Fen primi Canonis Avicennae* (Ferrara 1491, Venice 1498), *Expositio super quarta fen primi Canonis Avicennae* (Pavia 1478, 1484, 1496; Venice 1485, 1502, 1513, 1517, 1523, 1524, 1531; Siena 1485), and, above-all, the precious *Tractato utilissimo circa lo regimento e conseruatione de la sanitate* (Milan 1481, 1508) (ISTC 2016; EDIT 16 2016), written in Latin and successively translated into Vernacular, which is one of the first documents on hygiene published in Italian (DBI 1966), and which has found an enduring reputation.

Bernardi, Antonio

Born: 1502, Mirandola, Italy

Died: 1565, Bologna, Italy

Cristóvão S. Marinheiro

Réserve Précieuse, Bibliothèque nationale de Luxembourg, Luxembourg, Luxembourg

Abstract

Antonio Bernardi was a controversial Aristotelian humanist and a courtier at the court of the Farnese family. His positions in theoretical philosophy had a great impact on Jesuit scholasticism, and his views on ethics were discussed until mid-eighteenth century.

Alternate Names

[Bernardi della Mirandola, Antonio](#); [della Bernarda, Antonio](#); [della Mirandola, Antonio](#); [Bernardus, Antonius](#); [Mirandolano, Antonio](#); [Mirandulanus, Antonius](#)

Biography

Bernardi (Mirandola, Italy, March 1502–Bologna, Italy, March 18, 1565, or 19) studied philosophy at Bologna University from 1517 to 1533, where he had Piетро Pomponazzi and Ludovico Boccadiferro as teachers. In September 1533, he got his “laurea” at Ferrara under the supervision of Giovanni Mainardi and Antonio Musa Brasavola. From 1533 to 1539, he taught philosophy at Bologna University. During this time, he probably got acquainted with Achille Bocchi and his *Academia Hermathena* (Angelini 2009). In 1539, however,

he was forced to leave Bologna for Rome because of a “serious incident.” There he stayed with Giambattista Campeggi, and later with his brother Alessandro Campeggi, beginning to teach on Aristotle’s *Rhetoric*. His readings got noticed by Girolami Sauli, archbishop of Bari, who asked for his services. Yet, a few months later, still in 1540, he was appointed preceptor of Alessandro Farnese, grandson of Pope Paul III, initiating thus a long diplomatic and ecclesiastical career. He remained in the Farnese court until his death in 1565 (Forlivesi and Marinheiro 2009).

Heritage and Rupture with the Tradition

Bernardi’s positions on several points of Aristotelian doctrine were well-known before their publication. This has two implications for the modern reader: First, every work has an apologetic character and must therefore be crossed with the one of his opponent’s work. Second, the writings have to be considered with respect to the discussions they provoked, thus giving us a chronology to follow.

After Bernardi had left Bologna for Rome in 1539, his opinions on the Aristotelian *Categories*, which he had taught at Bologna University years before, provoked a response by Giacomo Giacomelli (1498–1560) in 1542. This forced Bernardi to defend his positions in his *Institutio in universam logicam*, published at the same time as his *Apologiae libri VIII* in 1545. Bernardi’s key argument was that the *Categories* were a purely ontological work and must not be taught as a part of logic, which would thus begin with the *De interpretatione*. The *Categories* should be considered as a part of the *Metaphysics* and integrated in the beginning of book Z. These philological and exegetical topics hide a systematic shift in the understanding of Aristotelian philosophy. First, following the Renaissance impetus *ad fontes*, Bernardi gets rid of the whole of the Aristotelian tradition, leaving aside the opinions of medieval authors as well as those of late antique commentators, trying to explain Aristotle’s positions with Aristotle only. Thus, the common interpretative aid given by Porphyry with his *Isagoge* and the well-known Porphyrian tree are dropped, and the

concept of *second intentions* developed by scholasticism is replaced by the one of *termini communes*. Moreover, *logica* and *dialectica* are not used as synonyms but distinguish two different topics: *Logica* is the discipline teaching us to assemble the instruments, such as the *termini communes*, necessary for the understanding. The way to put these instruments together is our capacity to speak in ordered sentences; this capacity is called *oratio* according to Bernardi. *Dialectica* is the discipline that uses the instruments developed by the *logica* in order to make correct judgments. The etymology of the Greek *logike* points to the Latin *oratio*, whereas the one of *dialektike* focuses on the syllogistical capacity and is translated as *ratio*.

About a decade later, Giovanni Battista Possevino’s *Dialogo dell’onore* of 1553 provoked the publication of Bernardi’s *Disputationes* in 1562. The link between these two publications is a feud between the Possevino brothers and Bernardi, who accused Giovan Battista of plagiarism. The object of the quarrel is a solution of “double truth” given to the question whether dueling was to be lawful or not. According to Catholic morals, dueling had to be prohibited. Yet, according to Aristotle and reason, dueling had to be allowed, since defending one’s honor is regarded as a legitimate defense against calumny and as a possibility to stop the ever running vendettas. This position had been developed by Bernardi in a lecture held in 1547 on the first book of Aristotle’s *Nicomachean Ethics* to the papal court (ms. BAV, Urbinate Latino 1414). According to Bernardi, Giovan Battista Possevino, who attended this lecture and was appointed to prepare it for publishing, had it circulated under his own name. After his sudden death, his brother Antonio published the work his brother had left. Recent research however seems to contradict Bernardi’s argument, leading us to the problem of the use of sources in the Renaissance (Riga 2016). It seems certain that the authorship of the *Dialogo dell’honore* has to be attributed to Giovan Battista Possevino. This publication issued in 1562, which was reprinted under the title *Eversionis singularis certaminis libri XL* without date, has to be considered

Bernardi's major work, as he used it to explain in detail his understanding of the whole of Aristotelian philosophy.

The "double truth" quarrel is implicitly related to the question of the *Cognoscentia Dei*, addressed in book 27. Here Bernardi discusses the potentiality of God's knowledge of the world he created. In his understanding of *Metaphysics* book 12, it is impossible for God to know what happens in the world as this would imply his knowledge not only of all the causes but also of all contingencies. This is the truth given to us by our limited reason, whereas there is a truth given to us by supposition (*ex suppositione*), on the base of the principles of natural reason, bringing us thus to an opposite truth (Landucci 2006).

Another point of Aristotelian doctrine, present in his *Disputationes* (liber XIII and XIV) which led to controversy, was Bernardi's reading of Aristotle's classical division of theoretical sciences. Aristotle had made a distinction between first philosophy (i.e., metaphysics), second philosophy (i.e., physics), and mathematics, a distinction commonly accepted by Aristotelian philosophers ever since. According to the nominalist reading of Bernardi, this distinction was made by convenience (*per commoditatem*), with respect to our *modus cognoscendi*, since there is a *philosophia* beyond this division, regrouping all of the realms of being. This *philosophia*, which is not identical to metaphysics but above it, as the *science of being qua being*, has no own subject-matter; its subject-matter is the sum of the subject-matters of the three theoretical sciences.

This general *philosophia* has its counterpart in Bernardi's *logica*: *Philosophia* treats all the realms of being, just as *Logica* treats all the realms of *oratio*.

Impact and Legacy

Bernardi's opinions had a wide impact in the sense that they were widely discussed and refuted within Aristotelian philosophy. Zabarella (1566), Pedro da Fonseca (1964a), and Sebastião do Couto (1606) (see ► "Conimbricense, Collegium") refuted his linguistic turn in logic. His

understanding of the unity of theoretical sciences by convenience was refuted by most Jesuit scholars of the Iberic Peninsula, such as Pedro da Fonseca, Manuel de Góis, and Francisco Suárez (Marinheiro 2009). His defense of a "double truth" position on the question of God's knowledge could not be accepted by Aristotelians of Thomistic tradition like the Jesuits (de Góis 1592, p. 330 sqq.), who considered this to be an averroistic position (Landucci 2006).

Nonetheless, some of his intuitions proved to be far-reaching, once the Aristotelian framework had been dropped. In a certain way, Bernardi could be considered as a forerunner of the concept of "mathesis universalis" or as a precursor of the linguistic shift in logic. In ethics, his ideas on honor were discussed until the eighteenth century (see Riga 2016) and Cavina (2009).

Abstract

Bessarion was a Byzantine scholar, theologian, philosopher, and cardinal of the Roman Church. He was born in Trebizond on the Black Sea and was brought to Constantinople where he received a literary and philosophical education. In 1430–1431, he joined the circle of Georgios Gemistos' (Plethon's) students. In 1438–1439, he participated in the council of Ferrara/Florence as a speaker of Byzantine delegation. After the council, he was made cardinal of the Roman Church. In 1455, he nearly became pope. He was a *legatus a latere* to Germany, Republic of Venice, France, Burgundy, and England. Almost all of B.'s political activities were directed towards advancing the preparations for the crusade against the Turks. In addition to a number of theological works, Bessarion composed two major philosophical treatises, *On Nature and Art* and *Against the Calumniator of Plato*. In *Against the Calumniator of Plato*, he defends Plato against a number of charges which Georgios of Trebizond had formulated against Plato in his treatise *Comparatio philosophorum Platonis et Aristotelis et de praestantia Aristotelis*. In *On Nature and Art* he evinces an agreement between the Platonic and the Aristotelian philosophies and also suggests an accord between Platonic philosophy and Christian theology.

Alternate Names

Also known as “[Bessarion, John](#)” or “[Bessarion, Basileios](#).” He was baptized with the name

Basileios and not John (Bianca [1999](#), pp. 141–149) and adopted the name of an Egyptian anchorite Bessarion upon becoming a monk. He frequently referred to himself as “[Bessarion Nicenus](#)” and, on rare occasions, “[Bessarion Venetus](#).” Since the monastic name is meant to replace the baptismal name, the combination “Basileios Bessarion” is misleading and should be avoided.

Biography

The year in which he was born is disputed; the month and date, on the contrary, are certain. While most of the older secondary literature (Vast [1878](#); Mohler [1923–1942](#); Labowsky [1967](#), [1979](#)) follows the testimony of Capranica and gives 1403 (cf. also Coluccia [2009](#)) as the year of his birth, Saffrey ([1964](#)) puts it as early as 1399 or 1400, and Monfasani ([1986](#)) has convincingly demonstrated that B. was born in 1408. Our knowledge of B.'s early years is mainly derived from the following sources: Niccolò Capranica's funeral oration (text in Mohler [1923–1942](#), vol. III, pp. 404–414), Bartolomeo Platina's panegyric of B. (PG 161, 104–116), Michael Apostoles' funeral oration (PG 161, 127–140, material for a new critical edition in A. Riehle's unpublished master thesis, LMU Munich 2006), and Pietro Ronsano's essay, composed ca. 1470 (cf. Termini [1915](#), pp. 163–167). It is very likely that all of these sources, with the exception of Michael Apostoles, were influenced by or indirectly derive their information from the biography of B. that had been composed by Niccolò Perotti, but which was never published and is now lost (cf. Monfasani [1986](#)).

According to these sources, B. was born in Trebizond on the Black Sea and was brought to Constantinople by Dositheos (PLP 5642, cf. Laurent [1933](#), pp. 153–155) in 1415–1416. There he received a literary and philosophical education under John Chortasmenos (PLP 30897) and Georgios Chrysokokkes (PLP 31142). From the autograph *curriculum vitae* preserved in Cod. marc. gr. 14, we know that he entered the Basilian order on 30 January 1423 and became a monk on 30 July 1424, taking

upon himself the name of the Egyptian anchorite Bessarion. In reference to B.'s early years, Platina and Capranica mention a certain archbishop of Selymbria who was in charge of B.'s education. This information inspired the hypothesis about B.'s sojourn in a monastery in Selymbria (cf. Mohler 1923–1942, vol. 1, pp. 43–45). However, the fact that B. studied under John Chortasmenos, who is identical with the *archiepiscopus Selymbriensis* mentioned by Platina and Capranica, does not necessarily imply that B. had actually stayed in Selymbria. As demonstrated by Loenertz (1944, p. 129) and Hunger (1969, p. 18), John Chortasmenos, who was in charge of several monasteries at the time, in fact continued to live in Constantinople and so it is safe to conclude that B.'s education, as he himself stressed on several occasions, took place in Constantinople. B. became a deacon on 8 December 1425 and a priest on 8 October 1430. In 1430–1431, he left the Byzantine capital for the Peloponnese, where he joined the circle of Georgios Gemistos' (Plethon's) students and remained until 1436. In his letters dating from this period, he refers with considerable reverence to his teacher Plethon, calling him "most godly leader" and "admirable master" (cf. letters 1, 4 and 8 in Mohler 1923–1942, vol. 3). This stay proved extremely beneficial not only for his intellectual development but also for his career: B. was soon included, together with his teacher Plethon, in the Byzantine delegation to the Council of Ferrara/Florence (cf. also Ronchey 2002). In fact, B. was made bishop of Nicaea on 11 October 1437, shortly before the Greek delegation departed from Constantinople. Later B. assembled his own early works written during this period in a single manuscript, now known as Cod. marc. gr. 533.

The Byzantines traveled to Italy to negotiate the Union of the Churches, but above all they were seeking military assistance from the West. Their delegation comprised such important intellectual figures as Georgios Scholarios, Mark Eugenikos, Georgios Gemistos (Plethon), Georgios Amiroutzes, and many others. Not all members of the Byzantine delegation were in favor of the union with the Latin Church, and even fewer were disposed to make any

concessions to the Latins. Mark Eugenikos, for instance, viewed the council as a kind of tribunal at which he would denounce the heresies of the Latin Church and thought that the Union was only possible if the Latins were ready to accept the teachings of the Greeks. For B. participation in the council was a turning point in his life and a first step towards a brilliant ecclesiastical career in the West. Soon after his arrival in Italy he was chosen to be one of the two spokesmen of the Byzantine delegation (the other being Mark Eugenikos) and was accorded the privilege of pronouncing the opening discourse on 8 October 1438. In it he encouraged the participants of the council to seek the truth and try to suppress the natural tendency of man to wish to prevail. The most controversial issue debated at the council was the question of *filioque*, which was considered both by the Latins and the Byzantines to be a significant impediment to the Union. Next in the order of importance and closely connected to it was the debate about the legitimacy of additions to the Nicene Creed, followed by discussion of the implications of the primacy of the pope and a series of other minor questions. B. played a central role in finding and negotiating solutions to each of these issues. On 13 April 1439 and 14 April 1439, he delivered his *Oratio dogmatica* to the assembled Greeks (text in Candal 1958, cf. also Lusini 2001). In it he tried to demonstrate that the teachings of the western saints on the issue of the *filioque* do not in fact disagree with those of the eastern saints. He also discussed the differences between the prepositions *dia* (through) and *ek* (from), thereby envisaging a solution that was approved by the Byzantine patriarch on 04 June 1439 and eventually accepted by the Greek delegation. The remaining issues, such as the doctrine of purgatory and the use of leavened and unleavened bread in the Eucharist, were discussed with much more haste as the Byzantine emperor urged that the negotiations be brought to a successful conclusion. The Byzantines signed the decree of Union on 05 July 1439. In a ceremony which took place in the cathedral of Florence, Cardinal Cesarini read the text of the decree in Latin and B. in Greek. The Union was achieved and the Byzantine delegation prepared to return home. B. left Florence for Venice on 20 July 1439.

Either on his way back from Florence to Venice or already in Venice he received a *breve* of Pope Eugenius IV, who invited him to collaborate with the Roman Church. B. accepted the papal offer and departed for Constantinople on 19 October 1439. On his way to Constantinople, B. was made a cardinal. The Byzantine fleet reached Constantinople on 01 February 1440. B. participated in the election of the new patriarch of Constantinople on 04 May 1440 and used his time in Byzantium to undertake research in libraries, seeking proofs for the Latin doctrine of the *filioque* in the oldest manuscripts of Basil he could find. This work was described by B. himself in a dogmatic letter addressed to Alexios Laskaris (text of the letter in PG 163, 321–406, research into the manuscripts of Basil mentioned in col. 325).

B.'s presence in the West is securely attested on 05 February 1442, when he signed the decree of Union between the Coptic and the Roman Churches, even though he must have been present in Italy much earlier, possibly as early as 10 December 1440. The bull of Eugenius IV granted B. the possession of houses and gardens adjacent to the Basilica of the Holy Apostles in Rome, which must have increased the cardinal's financial means. In the same year, he became protector and apostolic visitor of the Basilian Monasteries in southern Italy and Sicily. It was not until 1450, however, that he was entrusted with an important ecclesiastical mission on Italian soil, when Pope Nicholas V made B. his legate to Bologna, Romagna, and the March of Ancona. The objective of B.'s legation was to put an end to the ongoing unrest in Bologna and to reinforce the ties between that city and the Vatican. B. arrived in Bologna on 16 March 1450 and was to remain there for the next 5 years. During this time, he implemented a number of important regulations and reorganized the University of Bologna, establishing the chair of rhetoric. It was in Bologna that he finished his Latin translation of Aristotle's *Metaphysics* (Mioni 1960) and came to know Niccolò Perotti, who later became his secretary and close friend. It was also in Bologna that he received the sad news of the capture of Constantinople (1453) and the death of his teacher

Georgios Gemistos (Plethon). On 23 March 1455 B. was informed about the grave illness and the imminent death of Pope Nicholas V and departed immediately to Rome. He stood a fairly good chance of becoming the new pope. In fact, during the conclave he was supported by 8 cardinals out of 15, and during the night of 04 April 1455 the probability of his being elected seemed very high. On 08 April 1455, however, Alfonso De Borja was elected as Calixtus III. In the same year, B. departed for Naples, seeking to obtain the support of King Alfonso V for a crusade against the Turks. In the course of the following years, B. was appointed to a number of important ecclesiastical offices. In 1456 he was nominated archimandrite of the monastery of San Salvatore di Messina; in 1458 he was nominated Bishop of Pamplona (he renounced this title in 1462, in which year he became *perpetuus administrator sive commendatarius* of the monastery of Grottaferrata); in 1458 he also became protector of the Order of Friars Minor.

The year 1458 marked the beginning of B.'s polemics against Georgios Trapezuntios (cf. Monfasani 1976, 2008, 2012, 2013a). It was in this year that B. was informed about the pamphlet distributed by Georgios in which he attacked B.'s views on the role of deliberation in art and nature and about Georgios' publication of the *Comparatio philosophorum Platonis et Aristotelis et de praestantia Aristotelis* (henceforth cited as *Comparatio*). In response to these publications, B. composed his two major philosophical treatises, *On Nature and Art* (*De Natura et Arte*, henceforth cited as *NA*) and *Against the Calumniator of Plato* (*In Calumniatorem Platonis*, henceforth cited as *ICP*), which were completed and published 10 years later in 1469 (cf. also Hankins 1991).

Following the death of Calixtus III on 14 August 1458 and the election of Enea Silvio Piccolomini as Pius II, B., who in the conclave of 1458 opposed his candidature mostly in consideration of his ill health, was able to quickly gain confidence of the new pope. Almost all of B.'s activity during this time was directed towards advancing the preparations for the crusade against the Turks. This political project had occupied B.'s

attention from the time of his participation in the Council of Ferrara/Florence, but had become even more important to him after the capture of Constantinople in 1453. In January 1460, at the end of the Council of Mantua, which had been convened by Pius II in 1459 and in which B. had taken an active part, he was appointed *legatus a latere* and entrusted with a difficult if not impossible diplomatic mission of communicating the decisions of the Council of Mantua in favor of war against the Turks to the German princes and gaining their support. His other objective was to mediate in the conflict between the Holy Roman emperor Frederick III and Matthias Corvinus over dynastic succession in Hungary. In spite of a number of important results that B. was in fact able to achieve in Germany, his mission as a whole is rightly considered a failure as he was not able to obtain the support of the German princes for the war against the Turks. After prolonged stops in Nuremberg in February 1460 and in Worms, B. proceeded to Vienna, which he reached on 04 May 1460 and where he remained until autumn of 1461, when he returned to Italy (he arrived in Bologna on 23 October 1461 and in Rome on 20 November 1461).

Next important diplomatic mission with which B. was entrusted was an embassy to Venice. He departed for Venice as a *legatus a latere* on 05 July 1463 and arrived there on 22 July 1463. After only a week of negotiation, the Republic of Venice declared its intent to break off diplomatic relations with the Turks; the crusade was proclaimed in the Piazza San Marco on 28 August 1463. B. firmly believed that the outbreak of war was imminent and worked fervently on the final preparations. The pope asked Cristoforo Moro, the doge of Venice, to place himself at the head of the fleet, and the doge confirmed his intent to lead the crusade. However, these preparations came to an abrupt end with the death of Pope Pius II on 14 and 15 August 1464. During the conclave of 1464, Pietro Balbo was elected as Pope Paul II on August 30. The newly elected pope declared that the “chapters” or binding agreements that determined the conduct of elected prelates were only advisory rather than obligatory, which antagonized some the cardinals and in

particular B., who had played an important role in drafting this document. For this reason and on account of his ill health, B. chose to reduce his political engagement and decided to dedicate more time to his studies (cf. Monfasani 2011). However, he did not retire completely from public life but continued to fulfill a number of important ecclesiastical functions. In 1468 he successfully interceded with Paul II on behalf of Platina who had been imprisoned together with other members of the Roman Academy (Palermينو 1980). After the death of Paul II on 26 July 1471, the humanistic circles of Rome favored the candidacy of B., and in the conclave of that year B. could count on a number of votes. However, Francesco della Rovere was elected as Sixtus IV. The newly elected pope continued the policy of his predecessors towards the Turks and decided to send five legates to a number of European rulers in order to negotiate a new alliance against the Turks. B. was nominated *legatus a latere* to France, Burgundy, and England. One of his main objectives was to negotiate between King Louis XI of France and the Dukes of Burgundy and Brittany. B. was also supposed to obtain their support for a crusade against the Turks and to discuss several questions of importance to the Pope. B. was initially hesitant to accept this charge, but finally agreed, leaving Rome on 20 April 1472. On his way to France, he made frequent stops (in Urbino, Cesena, Bologna, Modena, Reggio Emilia, Parma) and reached Lyon on 20 June 1472. After a period of waiting, he was finally received by the king in Château Gontier on 23 and 24 August 1472, but his encounter with the king failed to bring the desired results. B. refused the king’s request to excommunicate the Dukes of Burgundy and Brittany and was obliged by the king to return to Italy without meeting the dukes. B. died in Ravenna on 18 November 1472 on his way back from France. His corpse was transferred to Rome and a funeral service was held on 03 December 1472 in the Basilica of the Twelve Apostles in the presence of the pope. Niccolò Capranica gave a funeral oration in B.’s honor. B. was buried in the grave he had prepared for himself in advance, decorated with his emblem showing two hands upholding the cross.

Heritage and Rupture with the Tradition

In addition to a number of theological works (Rigo 1994, 2012), Bessarion composed two major philosophical works, *NA* and *ICP*, which appeared in print in Latin as one book in 1469. For a partial translation and summary of the content of the *ICP* cf. Del Soldato (2014). In the first book of the *ICP*, B. defends Plato against a specific charge which Georgios of Trebizond had formulated against him in his *Comparatio*, namely of being an ignorant person who was incapable of writing down the principles of any art. B. does not limit himself to an explanation of Plato's motives, but also praises his wisdom by demonstrating Plato's mastery of every art and science, from rhetoric to dialectic, from mathematics to physics, and, above all, theology. In particular, B. adopts a conciliatory strategy which had been characteristic of Simplicios: on the one hand, he praises Plato as theologian while, on the other hand, he describes Aristotle as an excellent physicist, who focuses on natural beings (*ICP* I, III.1; cf. e.g., Siml. *In Phys.*, 404.21–405.5).

In the second book of the *ICP*, B. states explicitly his own intentions (*ICP* II, I.1): since both Plato and Aristotle were far removed from Christian religion, he is certainly not going to demonstrate that Plato was a Christian, but to show instead that Platonic philosophy is in closer harmony with Christian doctrine than is Aristotelian philosophy, so that it is easier to corroborate the truth of Christian religion using Plato's writings rather than using those of Aristotle. Since Georgios of Trebizond, on the contrary, dares to present Aristotle as a Christian, B. intends to demonstrate that Aristotle had in fact never defended the theses characteristic of the Christian doctrine which Georgios attributes to him. B. aims to show that Georgios' conviction that Aristotle had defended Christian theses is simply due to a misunderstanding and to his ignorance of the principles of Aristotelian philosophy (*ICP* II, III.2). It is important for B. to stress that it is not his intention to offend Aristotle in any way, because he honors both Aristotle and Plato (*ICP* II, III.2); B. also declares that he is aware of the fact that some aspects of Platonic philosophy are

incompatible with Christian doctrine (*ICP* II, III.3) and cannot, therefore, be approved or shared by Christians. Nonetheless, Platonic philosophy exhibits a closer affinity with Christian doctrine than does Aristotelian, and B. intends to demonstrate this by confuting point by point each of Georgios' theses. In the *Comparatio* II 3,20, Georgios makes reference to a passage from *On the Heavens* I,1 in which Aristotle introduces the concept of the triad (*De cael.* I 1, 268 a 9–13), and he uses this passage to prove that Aristotle had arrived at the idea of the Trinity; he then contrasts Aristotle with Plato and maintains that Plato not only had never known or grasped the Trinity, but had even professed the most abominable polytheism. B. replies that the Aristotelian passage referred to by Georgios in no way has the meaning which George wishes to attribute to it; this is made evident by the interpretation of the same passage by such authorities as Thomas Aquinas (*ICP* II, V.1). In this way, B. succeeds in showing both Georgios' lack of skill as an interpreter of Aristotle's thought and Georgios' superficial knowledge of Scholastic authors. B. is convinced that neither Plato nor Aristotle had arrived at knowledge of the Trinity, since the human mind is unable to acquire by itself such knowledge. This knowledge is in fact acquirable only by faith and through divine instruction (*ICP* II, V. 3). And yet, B. makes reference to Plotinos' treatise *On the Three Primary Hypostases* and to those passages in the Platonic dialogues which had been used by Plotinos himself in this context in order to prove that his theory was the true doctrine of Plato (*ICP* II, V. 4–9; cf. Plot. *Enn.* V.1,8), and he shows that Plato and the Platonists – and not Aristotle, who never speaks about the Trinity (*ICP* II, V. 10) – had somehow arrived at an understanding of the Trinity, even though their comprehension of it was far removed from the teachings of the Christian religion (*ICP* II, V. 3). B. has no difficulties in dismissing Georgios' accusation of polytheism too: he points out that Aristotle also assumed a plurality of Gods, which becomes evident if one considers the Aristotelian doctrine of the 55 movers (*Arist. Metaph.* XII 8, 1073a37ff.). Thus, both Plato and Aristotle are guilty of an error that Georgios would like to ascribe to Plato

alone (*ICP* II, V.12–13), and both are extraneous to the Christian religion. In *Comparatio* II 10–11, Georgios maintains that while in Plato's view all beings come to be only through a process of production out of a preexistent matter, Aristotle arrives at the idea of creation out of nothing and in virtue of the sole will of God (*ICP* II, VI.1). B. replies that the opposite is true: Aristotle denies that something can come into being absolutely out of nothing (Arist. *Phys.* 191 a 30–31) and teaches that matter is eternal and nongenerated (Arist. *Phys.* 192 a 25ff.), whereas Plato is of the opinion that matter has been produced by God and is, therefore, "generated" in the sense of having a cause (*ICP* II, VI.5; II, VII). In order to demonstrate that for the Platonists matter does not constitute an independent principle or a cause which is equal to God and itself uncaused, B. relies on the Proklean doctrine according to which matter, as ultimate unlimitedness, proceeds both from the One and from the primary Unlimitedness, and cites almost *verbatim* passages from Proklos' *Commentary on Plato's Timaeus* (cf. *ICP* II, VI.11, p. 120, 15–21 Mohler; cf. Prokl. *In Tim.* I 384, 30–385, 10). B. is aware that Plato himself declared in the *Timaeus* that "there are Being and Space and Becoming [...] even before the heavens were created" (Pl. *Tim.* 52d 2–3; *ICP* II, VI.7, p. 114, 12–13), which had led some to believe that for Plato matter is uncaused and precedes the generation of the universe. However, B. explains that this interpretation is erroneous. Taking up a well-known Proklean argument, he explains that it is only the account (*λόγος*) that divides things that have been set up together and introduces a succession where all is at once (cf. Prokl. *In Tim.* I 382, 30–32; II 101, 5–7; cf. *ICP* II, VI.7, p. 114, 17–19, where B. quotes *verbatim* Prokl. *In Tim.* II 101, 5–7). This means for B. that in Plato's view matter and cosmos are distinct merely conceptually (*epinoia*) and with respect to the account, but not in reality (*pragmati*) (*ICP* II, VI.7). It is true that matter constitutes a principle of things that come to be, but it is not the principle *simpliciter*. Moreover, for B., who takes up here the Neoplatonic distinction between the causes, properly so-called, and the by-causes (cf. Prokl. *El.Th.* prop. 75), matter is not

even conceived by Plato (and the Platonists) as a cause, but as a by-cause (*ICP* II, VI.16). In order to define its essence, B. basically reassumes Simplicios' doctrine (cf. *ICP* II, VI.16 e cf. Simpl. *In Phys.* 227, 23–231, 30).

Since Georgios also criticizes the Platonic doctrine of soul (*Comparatio* II, 12), B. felt the need to demonstrate that Plato had a "sublime" opinion on this issue. B. admits that some of Plato's opinions are unacceptable for a Christian (e.g., the idea of the preexistence of souls, cf. *ICP* II, VIII.16), but he points out that Plato's teaching is nonetheless in accord with Christian doctrine. Against Georgios who criticizes Plato's idea that souls transmigrate into the bodies of irrational animals, B. points out that Plato had spoken of the bodies of wild beasts only in order to instill fear into the common people and to keep them away from vice. Moreover, B. remarks that even if Plato had admitted this kind of transmigration, it should not be understood in the way Georgios understands it (*ICP* II, VIII.23). Georgios also contends that Plato had denied providence (*Comparatio*, II, 17). So B. lists all passages in which Plato speaks of divine providence, pointing out that especially in Book X of the *Laws* Plato accuses of impiety anyone who denies providence and presents a doctrine of providence that in many respects is quite similar to Christian teachings on the same subject (*ICP* II, IX.11). What is more, B. points out that it is Aristotle who seems to deny providence, since he conceives the divine intellect as thinking only of itself (Arist. *Metaph.* XII 9), which could lead to the conclusion that for Aristotle God is not concerned with human matters and, therefore, does not exercise providence over them, given that it is not possible to care about that which is unknown (*ICP* II, IX.2). B. also employs many arguments in order to confute the accusation that Georgios formulates in *Comparatio* II, 17, according to which Plato had supposedly stated that everything happens of necessity. In particular, B. refers to the theory of divine knowledge formulated by Proklos in the *Elements of Theology* (Prokl. *El.Th.*, prop. 124), in order to demonstrate not only that the Platonists had admitted divine providence and the divine knowledge that is connected to it, but also that they had even been

able to form such a concept of the divine knowledge that does not annihilate contingency (*ICP* II, X. 9–10).

In the third book, B. directs his attention to the same subjects that he had already addressed in the second book (such as the Trinity, matter, soul, providence, fate, and necessity) and supports his arguments with evidence taken from Christian and especially Scholastic sources, and he demonstrates how weak is Georgios' knowledge of both these sources and Aristotle. With regard to the Trinity, B. points out that the mystery of the Trinity was known neither to Plato nor to Aristotle even if some hints suggesting a vague inkling of the Trinity may be found more frequently in Plato than in Aristotle (*ICP* III, XV. 1). In reply to Georgios' assertion that Aristotle had fathomed the Trinity from vestiges of it found in the created world (*Comparatio* II 4, 17–20), B. stresses that all theologians (from Augustine to Aquinas, from Basil the Great to Gregory of Nazianzos) uphold the impossibility of knowing the Trinity by natural reason alone (*ICP* III, XV. 2). Additionally B. emphasizes that according to these theologians the created world allows one to obtain knowledge of the essential attributes of God, but neither of the personal properties nor of the essential attributes associated with persons (i.e., ascribed to the persons by appropriation), insofar as they are associated with them (*ICP* III, XV.4; cf. Thom. *S.Th.*, I, 32,1; *S.Th.* I, 39,7). This means that if Aristotle had had some knowledge of God through his knowledge of God's creatures, he could have known only the essential attributes of God (*ICP* III, XV.6). B. goes even further and makes an attempt to demonstrate that the idea of the Trinity itself does not accord with the principles of Aristotelian metaphysics (*ICP* III, XIX.3–5). Finding support in the testimonies of Albertus Magnus and Thomas Aquinas (*ICP* III, XX.11 e XX.14), B. even shows that the concept of the *creatio ex nihilo* is at variance with the principles of Aristotle's metaphysics and concludes that Georgios was able to find this concept in Aristotle only because he was not familiar with Aristotle or because he misinterpreted his thought. In the *Comparatio* II 16, 13–14, Georgios states that if God creates everything out of nothing, then the

soul too must have been created by God, and he remarks that according to Aristotle himself the soul comes into being together with the body because of God who creates it *ex nihilo* and infuses it into the body (that is, by virtue of God's creation out of nothing). In response, B. demonstrates that the idea of a *creatio ex nihilo* is entirely foreign to Aristotle as well as the idea that the soul comes into being together with the body in virtue of an act of divine *creatio ex nihilo* (*ICP* III, XXVII, 1–3).

In the fourth book of *ICP*, B. defends Plato against the accusation formulated by Georgios in the third part of the *Comparatio*, i.e., the charges of voluptuousness and depravity. Book V lists several errors which B. was able to identify in Georgios of Trebizond's Latin translation of Plato's *Laws* (cf. also Pagani 2011). In this "review," B. first cites the original passages from Plato's *Laws* that, in his view, had been translated incorrectly by Georgios, then provides observations on semantics, syntax, different readings of the manuscripts, and various possibilities for translating these passages into Latin, and finally suggests his own solution. In this way he lists from the *Laws* 76 problematic words, phrases or passages, 46 from the first book, and 30 from the second book. In some cases, B. includes longer comments or observations on Plato's text or attacks Georgios *ad personam*, for instance, by mentioning some details about Georgios' business or private life that serve to discredit him.

The sixth book of *ICP* was actually composed prior to books I–V (Marie 2013). It was written after Georgios had published the *Comparatio* but before B. had had the chance to read it. In 1458, Georgios of Trebizond had published a refutation of a letter which B. had written to Theodoros Gazes, who in turn had previously asked for B.'s opinion regarding some observations that Georgios Gemistos (Plethon) had made in his *De differentiis*. When B. heard of the letter written by Georgios of Trebizond in which he was attacked, he decided to compose a comprehensive reply. This must have been completed, or at least initiated, prior to B.'s participation in the Council of Mantua and his legation to Germany and was later added as the sixth and last book of the *ICP*.

Critical edition of the Greek and two Latin versions of this book (with German translation) is found in Mariev et al. (2015), an often unreliable Italian translation based on Mohler's text in Accendere and Privitera (2014). In Chapter I of *NA*, B. recapitulates the position of Theodoros Gazes, who defends the Aristotelian standpoint regarding the relationship between nature, finality, and deliberation, and maintains that neither art nor nature deliberates. Theodoros invites B. to offer a demonstration of the thesis which Georgios Gemistos (Plethon) had defended in his treatise *De differentiis*: in this work Plethon had criticized Aristotle's idea that nature produces its products for the sake of an end, even if it does not deliberate. In Chapter II, B. demonstrates that it is true that Aristotle attributes purposiveness to nature but denies that nature deliberates, whereas Plato and the Platonists believe that nature not only acts for the sake of an end but also deliberates. And yet, Aristotle and Plato (and the Platonists) are not in disagreement. If Plato and the Platonists ascribe deliberation to nature, they do not intend thereby to maintain that nature exercises its own proper reasoning. On the contrary, nature's deliberation is in fact the deliberation which is exercised by the intellect that governs nature and directs it towards an end. So nature is not the highest cause but only an instrumental cause. In this way, B. finds a solution that evinces an agreement between the Platonic and the Aristotelian philosophies and he also suggests an accord between Platonic philosophy and Christian theology. The concept of nature as instrumental cause is indeed Platonic (cf. Simpl. *In Phys.* 314. 9–14), but it perfectly accords with the Thomistic idea of nature as *instrumentum dei* (Thom., *S.Th.*, I–II, 1,2). B. refers to Thomas Aquinas not only in Chapter II, where he quotes Aquinas' text without mentioning his name, but also in many other passages of this treatise where he explicitly advocates the authority of "our theologians, especially the Latin ones" (*ICP* VI, VIII.4). The treatise *NA* contains the letter of Georgios of Trebizond addressed to Jesaiah of Cyprus (Chapter III) in which Georgios tries to demonstrate the various weaknesses of B.'s standpoint – it was this letter that had prompted the composition of the *NA* –

and harshly criticizes the central concept which B. had employed in order to prove that nature deliberates, namely the concept of nature as an instrumental cause, i.e., an instrument of the intellect. Georgios argues that if nature were an instrument, it would be separated from its products and not connected with them in an inseparable way and intrinsically conjoined with them as nature is supposed to be according to Aristotle. In Chapters IV–X of *NA*, B. replies to the accusations of Georgios and demonstrates Georgios' incompetence in Aristotle's metaphysics, corroborating his own interpretation of Aristotle by the reference to the exegesis of famous Aristotelians such as Alexander of Aphrodisias. In the third book of *ICP* (*ICP* III, XX.17), B. refers again to Georgios' criticism of the concept of nature as an instrument found in George's letter to Jesaiah (which forms part of *NA*), and he points out the surprising and even ironical fact that Georgios himself makes use of the very same concept in the *Comparatio* (II,10) in order to praise Aristotle, which constitutes for B. yet another proof of Georgios' incoherence and incompetence (cf. also Del Soldato 2008).

Abstract

Theodore Beza (1519–1605) was a very important humanist belonging to the Reformation movement. As a close friend of Calvin, he strongly defended Calvinism and its organization. He was also the author of an important historical and literary work.

Biography

As a native from Burgundy, Theodore Beza received a strong education. He first studied Latin and Greek in Orléans with the humanist Melchior Wolmar and then completed legal studies in Bourges. After a long process, initiated after reading a treatise of Heinrich Bullinger, he converted to the Reformation in 1548 and fled to Geneva and then Lausanne, where he taught Greek in the academy. As a close friend of Calvin, he came back to Geneva in 1557, and, after the death of the reformer, in 1564, he took his succession as moderator of the Company of Pastors and leader of Calvinist world until his death in 1605.

Even if his greatest body of writing is dedicated to theology, we have to pay some attention to the political dimension of his thought. The main reflection of Beza in that domain concerns the right of resistance. Influenced by Calvin's thought, he brought his own stone to the building reformed conception of active disobedience in case of spiritual tyranny exercised by a prince on his subjects. In 1554 in a brief passage of his *De Hæreticis a civili magistratu puniendis*, he evoked, more clearly than Calvin did in the *Institutes of the Christian Religion*, the duties of inferior magistrates who have the responsibility to resist when a prince decrees against the preservation of the "purity of religion." Nevertheless, his thought on this sensitive issue remained still ambiguous, since in the most part of his book, he continued to reaffirm the duty of obedience of the subject to his prince, regardless of his vices.

A few years later, in 1560, in his *Confession de la foy chrestienne*, he explained his position more accurately stating that it is the responsibility of middle powers to resist the tyrant. But his conception of resistance then remained strictly constitutionalist. He did not fail to insist on the absolute obligation "to individuals who are under the power of a tyrant" to stick to a passive disobedience. His reflection on that subject completed Calvin's one and played a major role in the Calvinist approach of the duty of obedience to authority.

After the Saint Bartholomew's Day massacre, Beza radicalized his thought and took part to the Monarchomach movement. In his *De jure*

magistratum, first published in Latin in 1574 and then translated into French, he gave great importance of spiritual resistance against tyranny, stressing the duty of Christians to obey God in priority. He asserted the legitimacy of armed resistance to a prince who would be in violation of edicts of pacification (in the French context) allowing the practice of "true religion, since that prince would then use tyranny to which it is permitted to object." Even if the treatise was published anonymously, the authorship of Beza makes no doubt.

In addition to his theological and political activity, Beza also wrote some more literary texts: poetry, published in his *Poemata* (1548), the translation of *Psalms*, a biblical drama entitled *Abraham sacrificant* (1550), and *Passavantius* (1553), a satire directed against Pierre Lizet, former president of the parliament of Paris, which had been the source of the "Chambre Ardente." He finally compiled the *Histoire ecclésiastique des Eglises réformées de France* (1580).

As one of the most influent leaders of the Reformation, he was in touch, during his whole life, with all that the protestant international network had of prominent people: princes, their councilors, theologians, diplomats, and political writers. His very impressive correspondence is a good testimony of the importance and the intensity of his epistolary activity, which is itself a proof of its influence.

Abstract

Abraham Bibago was a Jewish Averroist, whose work treats the connection between Judaism and philosophy as well as Aristotelian logic, physics, and metaphysics. His numerous writings can essentially be divided into two groups: (1) philosophical and scientific works and (2) religious works. The first group consists of interpretations of Aristotle's works taking into account inter alia several of Averroes' commentaries. He also addressed current scholastic issues and in general strove to promote the Aristotelian approach. His religious writings, most prominently the *Derekh Emunah* ("Way of Faith"), strive to present a unified portrait of the world, which preserves a place for science and philosophy alongside Talmudic based religious life. In general, Bibago says in these works that philosophy and science can lead to human perfection, but so can faith. Often, he suggests that the perfection obtained through faith is superior to that attained through human intellect. These views, however, are not supported by the philosophical and scientific works, where Bibago presents Aristotelian philosophy as the *only* way to achieve human perfection. He even suggests in these works that the true purpose of Judaism is to allow the elite to study philosophy. Bibago's two contradictory views, which he gives in different kinds of works, mark him firmly as a Jewish Averroist.

Alternate Names

Bivagch, Bivach, Bichai, Vivachi; Bibachi; Bibago, Abraham ben Shem Tob; Bibago, Abraham ben Yom Tob

Biography

Abraham Bibago lived, wrote, and taught in Aragon in the turbulent years that led to the Expulsion of the Jews from Spain. Bibago grew up in the aftermath of the widespread destruction of the Jewish communities of Castile and Aragon between 1391 and 1412. As an adult he witnessed the widespread unification of much of Iberia by Ferdinand and Isabella in 1479 and the subsequent establishment of the Inquisition in 1480. He lived through the expulsion of the Jews from Andalusia in 1483, but died about 3 years before the expulsion of Jews from all of Iberia in 1492. In addition to a classical Jewish education, involving study of Bible, Talmud, and a wide range of Jewish mystical, theological, and philosophical works, Bibago was well versed in the Greek works available to him (mostly Aristotle), Arabic works including Averroes, Avicenna and Al-Ghazzali, and Christian scholasticism. Bibago certainly read the scholastic works in Latin, but his study of the Greek and Arabic thinkers seems to have relied on Hebrew translations (it is not certain whether he knew Arabic; he probably did not know Greek). While in Huesca, he had some dealings with King John II of Aragon and seems to have been involved in a public discussion with a Christian scholar. It seems he left Huesca sometime in 1466–1470 under suspicion of heresy. Despite this, he seems to have led an academy at Saragossa by 1471 and to have been involved in communal life, delivering public sermons in the synagogue and working with Jews who had been forcibly converted to Christianity. He seems to have died before the 1489 trial against prominent Aragonian Jews who helped forced converts return to Judaism.

Works and Themes

The majority of Bibago's works are philosophical and scientific in character, and while they may make reference, usually in introductions, to Jewish religious texts, their primary content is not religious. Nevertheless, his writings are all in Hebrew for a presumably Jewish readership that was educated and interested in science and philosophy. His most important philosophical works are his Commentaries on Aristotle and Averroes: he wrote on the *Posterior Analytics*, on the *Physics* (now lost), on the *Metaphysics*, on the *De Anima* (which survives as marginal notes to Averroes' *Middle Commentary*), and on Averroes' medical compendium known as the *Colliget* (now lost). In those commentaries that are extant, we see Bibago make use of a vast number of scholars, Greek, Arabic, Jewish, and Christian, in addition to Aristotle and Averroes. Bibago generally presents these thinkers by name, but he does not always state when he is quoting Aristotle and Averroes. Indeed, he often substitutes Averroes' words for Aristotle's without indicating this and presents Averroes' words as though they were Bibago's own. This is most evident in certain sections of his commentary on the *Metaphysics*, where Bibago quotes from Averroes' *Middle Commentary* on the *Metaphysics* as if it were the text on which he comments and then presents text from Averroes' *Long Commentary* on the *Metaphysics* as if it is Bibago's own commentary. That is, Bibago sometimes uses Averroes' *Long Commentary* to explain Averroes' *Middle Commentary*. This confusion may be deliberate. In his introduction in rhymed-prose to the Commentary on the *Metaphysics*, Bibago says that "necessity" brings him to speak in "the language of the author or according to his views" even when those views run counter to religion. As a result, Bibago notes, anywhere his commentary departs from religiously acceptable views may reflect the voice of Aristotle or Averroes. That is, Bibago's *Commentary* on the *Metaphysics*, like his other philosophical commentaries, presents philosophy as it is without apologetics and leaves to the readers the task of sorting what is

religiously acceptable from what is not, and of attributing the latter to Aristotle and Averroes, but not to Bibago. Yet, Bibago sees his commentaries as fulfilling a religious function. Especially in the *Commentary on the Metaphysics*, Bibago describes philosophical speculation such as he undertakes in that work in religious terms as leading to salvation and redemption. That is, despite acknowledging philosophy's occasional differences with Judaism, he casts philosophy as the ultimate task of religious life and, in other sections, as true human happiness.

Nevertheless, Bibago's religious works depict faith as the ultimate purpose of human life, perhaps even above intellectual thought. In his most widely read work, *Derekh Emunah* ("Way of Faith"), Bibago attempts to fuse an essentially Aristotelian view of the world with one that he sees as acceptable to regular Jews of his time. *Derekh Emunah* approaches this fusion through an analysis of central theoretical and theological issues, such as God's providence, the role of human intellect and faith, and fundamental religious principles. Bibago's approach to these issues is most frequently to bring and then interpret numerous statements from the Bible, Talmud, Midrash, and even Jewish folk legends. The interpretations he gives are clearly philosophical and, indeed, quite obviously Aristotelian. That is, Bibago's interpretations of traditional texts are with a view to an outside, philosophical standard: Bibago makes religious texts conform to a view of philosophy, rather than vice versa. Moreover, *Derekh Emunah* adopts intellectual conjunction as the ultimate end of human life. Like Maimonides, Bibago identifies this conjunction with prophecy and prophetic activity and generally with human spiritual happiness. Yet, he recognizes that the traditional Jewish texts do not describe intellectual conjunction in sufficient detail and accordingly sends his readers to Aristotle's *De Anima* and *Metaphysics* as well as Averroes' *Epistle on the Possibility of Conjunction*. Most importantly, Bibago claims in *Derekh Emunah* that Faith can imitate intellectual thought and together with Revelation, which comes with conclusions of scientific notions, can create conjunction between humans and divine intellect,

even without full performance of the human intellect. That is, faith and revelation provide a substitute for intellect that can allow nonintellectual Jews to attain ultimate human happiness, viz. conjunction. Whereas in the philosophical works, the emphasis is on the *activity* of philosophy with somewhat open-ended conclusions, *Derekh Emunah* focuses on alleged conclusions of philosophy and utilizing them to form a pseudo-intellectual conjunction.

Impact and Legacy

Bibago's significance is in promoting an Aristotelian/Averroist view of the world after such a view had already been called into question by such important thinkers as Crescas and Albo. His community building efforts at Huesca and Saragossa were ultimately not fruitful, no doubt due to the expulsion of the communities in 1492. He had a more marked influence on other Jewish thinkers, particularly Isaac Arama and Isaac Abravanel. In particular, Abravanel's discussion of principles of faith in *Rosh Amana* is a response to part iii of *Derekh Emunah*, even though Abravanel does not mention Bibago by name there. Unlike Bibago, Abravanel does not include philosophical interpretations of traditional texts in his *Rosh Amana*, and it is possible he found those interpretations to be overly fanciful. Bibago is vehemently criticized by Jacob Ibn Habib in his *En Yakob* for his philosophical interpretations of the Talmud, which Ibn Habib states that even Bibago himself did not believe. The *En Yakob* strove to derive theological notions from the Talmud, rather than read philosophical ideas into it. We find mention of Bibago in a number of other important Jewish thinkers including Shelomo Alqabes, Jacob Luzzatto, Joseph Solomon Delmedigo, Judah Moscato, Moses Mat, and Samuel David Luzzatto.

Bible, Editions, and Translations in the Renaissance

Grantley McDonald

Abstract

The invention of printing in the mid-fifteenth century greatly encouraged the dissemination and study of the bible in the original Hebrew and Greek, in ancient translations (most importantly the Latin Vulgate), and, from the 1520s onward, a bewildering variety of translations into the European vernaculars. Increased access to the bible encouraged philological improvement of the text and new ways of reading and interpreting it, with profound implications for philosophy and theology of all kinds.

The Hebrew and Christian Scriptures from Antiquity to the Middle Ages

While the bible was a centrally important text in the Middle Ages, its direct readership was limited to those who could understand the languages in which it was recorded and transmitted. Throughout Antiquity, the Middle Ages, and Renaissance, most Jews read or heard the Hebrew Bible either in its original language, in the Greek translation of the Hebrew Bible and most of the intertestamental books (the Septuagint), or in one of several early Aramaic translations (the “Targums”). In Late Antiquity, many Christian readers on the northern edge of the Mediterranean could understand Greek, which permitted them to read the *Septuagint* (which they called the Old Testament) and the Greek New Testament. In North Africa, knowledge of Greek was less widespread, and from the second and third centuries, parts of the Old and New Testaments were translated into Latin at different times and places. These early translations

are known collectively as the Old Latin (“Vetus Latina”). The Vetus Latina and the other early translations into various eastern languages provide valuable evidence of the state of the Hebrew and Greek texts in the early centuries of Christianity (Barrera 1998). Encouraged by Pope Damasus and others, the Christian scholar Jerome undertook to retranslate some books (notably the Gospels) into better Latin, and to revise other portions of the Vetus Latina. His Greek manuscripts were evidently similar, but not identical to Codex Sinaiticus (8) and Codex Vaticanus (B); his Hebrew ones presented something similar to the Masoretic text. The result, later dubbed the *Vulgate*, was not transmitted faithfully; some scribes reintroduced familiar features of the Vetus Latina or made small alterations to reflect doctrinal developments. Cassiodorus, Charlemagne, Theodulf of Orléans, Lanfranc, and others all attempted to restore Jerome’s text. The *Vulgate* was not prescribed as the official Latin translation of the Catholic Church until the Council of Trent (1546) but achieved de facto canonicity during the Middle Ages, especially in its textually deficient “Parisian text,” the *Textus Receptus* of late mediaeval theologians and philosophers. While most Christian readers in the western Middle Ages encountered the bible in the *Vulgate* translation, a few Christian scholars learned Hebrew or Greek in multilingual areas such as Spain or Southern Italy, or from immigrant native speakers, to deepen their knowledge of the Scriptures.

Innovations in Biblical Scholarship During the Age of Humanism

The advance of the Ottoman Empire during the first half of the fifteenth century encouraged attempts to overcome the entrenched animosity that had divided the eastern (Byzantine) and western (Latin) halves of the old Roman Empire. The presence of Greek delegates at the Council of Ferrara-Florence (1438–1445) stimulated interest in the Greek language and in the writings of the Greek Fathers. The Florentine humanist and statesman Giannozzo Manetti (1396–1459), who served as papal secretary under Nicholas

V (1453–1455), learned Greek and Hebrew to engage with the bible in its original languages. He was struck by the ways in which the *Vulgate* differed from the Hebrew and Greek texts. He also pointed out that some of these differences have doctrinal implications; Moses, he noted, said nothing about original sin or the afterlife. Following explicit principles, he translated most of the New Testament from Greek into Latin. His intention to translate the Old Testament from Hebrew using the rabbinic commentaries was prevented by his death. The only part of this latter project to survive is the *Psalms*, which renders the Masoretic text in idiomatic Latin. He was attacked for his presumption to improve on the *Vulgate*. The Florentine chancellor Leonardo Bruni questioned the value of Hebrew studies. However, Manetti argued that his intention was to remove ambiguities in the *Vulgate* and to produce a sound translation, faithful to the original text. His knowledge of Hebrew was not always matched by a positive attitude toward Judaism. He argued that the ritual commandments enjoined on the Jews in the Hebrew Bible limit human freedom. He also believed that his work would help defend Christianity against Jewish accusations that its doctrines were founded on misunderstandings of the Hebrew text (den Haan 2016).

Lorenzo Valla (c. 1407–1457) undertook systematic philological work on the Vulgate New Testament. Valla learned Greek from the erudite manuscript dealer Giovanni Aurispa but regretted that he never learned Hebrew. Valla used philological criteria to question the purported origin and antiquity of important documents such as the Apostles’ Creed and the Donation of Constantine, a forgery purporting to grant the pope control over the western Roman empire. He also advocated a return to patristic theology in place of the intricate logic and metaphysics of scholasticism. Valla only escaped political trouble and even a heresy trial through the protection of powerful patrons, such as Ferdinand of Aragon and Pope Nicholas V. Valla intended to publish an edition of the *Vulgate* as Jerome left it, free of later textual corruptions. However, he subsequently became convinced that a new translation from the Greek, as faithful to the original as Latin idiom allowed,

would be preferable. This undertaking was only a partial rejection of the *Vulgate*, since it represented a fulfilment of Jerome's intention to reflect the "truth of the Greek text" (*Graeca veritas*) in Latin. However, Poggio Bracciolini and others criticized Valla for turning text-critical tools, useful when used to amend pagan authors, on the *Vulgate*. Valla replied that the *Vulgate* is merely a translation, not the original text. Moreover, he questioned the traditional assumption that Jerome was even responsible for translating the entire *Vulgate*; where Jerome cites the bible in Latin in his theological works, the reading sometimes differs from that in the *Vulgate*. Valla's translations of the bible employ a classicizing Latin style and contain some elements of commentary, in which he focused on the literal sense of the text, one of the four modes of reading (*quadriga*) codified as a tool for Scriptural exegesis by early Christian fathers such as John Cassian (c. 360–435). (Further on biblical hermeneutics in the Renaissance, see Hauser and Watson 2009; Greenslade 1963; Reventlow 2010; and Shuger 1998). Like many humanists, Valla preferred the older meanings of words, avoiding later ones as corruptions. He also emphasized the utility of rhetoric in theology. He was sensitive to the theological implications of the choice of words in the Greek text and the Latin translations, such as the translation of *logos* (as either *verbum* or *sermo*) when referring to Christ. Yet Valla's work was not perfect. He was hindered by his tendency to take classical Greek rather than Koine as his standard. His translations occasionally miss the point. Sometimes he added words to round out the sense. He compared readings from different manuscripts, but his selection of variants was unsystematic. Nevertheless, his approach placed biblical interpretation on a new foundation by insisting on the importance of philology (Bentley 1983).

The Latin Bible in the Age of Print

The development of printing affected biblical studies dramatically. The first complete book printed in Europe was an edition of the Latin

Vulgate. The two Latin Bibles printed by the partners Johann Gutenberg, Johann Fust, and Peter Schöffer in the 1450s, known as the 42-line bible and 36-line bible, respectively, were both set from different manuscripts of the Parisian text. Some copies were printed on vellum and illuminated, in imitation of manuscripts. Different copies show evidence of frequent in-press corrections. Fust and Schöffer printed an edition of the *Psalms*, Canticles, and other liturgical material in 1457. Further editions of the Latin Vulgate were soon printed at Mainz, Strasbourg, Rome, Basel, Nuremberg, Venice, and elsewhere. Editors and printers also responded in different ways to the need for help in interpreting the bible. In about 1480, the Strasbourg printer Adolf Rusch produced an edition of the *Vulgate* with the *Glossa ordinaria*, a mediaeval commentary drawn from the Fathers, partly interlinear, partly surrounding the biblical text. A *Vulgate* edition printed at Basel by Kessler in 1487 contains prefaces describing the early translations such as the *Septuagint* and laying out the principles of biblical interpretation.

Renaissance philologists tried to improve the text of the Latin Vulgate, either by showing where it differed from the originals or by using older and better manuscripts. The editor of a bible published in 1479, probably by the Basel printer Johann Amerbach, responded to the humanistic desire for textual accuracy by claiming to have corrected the text against the Hebrew and Greek originals. In 1522, the Nuremberg printer Friedrich Peypus produced a Vulgate Bible which contained notes on the Hebrew text in the margin. In 1527–1528, the Parisian scholarly printer Robert Estienne published a Latin Bible whose text was based on three early manuscripts, compared with the best printed editions. This edition, the first thorough attempt to improve the text of the *Vulgate*, was criticized by the theological faculty at Paris, partly because of its "heretical" paratexts. Nevertheless, Estienne reprinted the *Vulgate* in ever more carefully corrected folio editions in 1532, 1538–1540, and 1546, and in smaller-format editions derived from these. Other editions that pointed out the deficiencies of the *Vulgate* attracted similar official opprobrium. The edition of Johannes Benedictus (Paris, 1541), which contains marginal

notes pointing out where the *Vulgate* differs from the Hebrew and the Greek, was later placed on the Index. The annotated edition of Sanctes Pagninus' Latin version published by Michael Servetus (Lyon, 1542) suffered the same fate.

In 1546, the Council of Trent declared the *Vulgate* authentic, that is, both officially approved and faithful to the original languages. Accordingly, the Leuven theologian Johannes Henten produced an edition in 1547 which gives Estienne's text, modified according to further manuscript evidence, but excluding or editing prefatory and marginal material which betrayed Estienne's evangelical bent. Henten's edition appeared with the imprimatur of the conservative Leuven faculty. In 1574, a team of scholars at Leuven led by Franciscus Lucas Brugensis published an authorized revision of Henten's edition, which contained further textual material from the Antwerp Polyglot; the accompanying volume of notes appeared in 1580. Despite the declaration of the *Vulgate* as authentic, no edition was issued with full authorization of the Vatican until Pope Sixtus V (1585–1590) actively promoted the production of an authoritative text based on early manuscripts and printed editions. In cases where the choice between two variants was not clear, the editors chose readings supported by the Hebrew and Greek texts. The result, published at Rome in 1590, was quite close to Estienne's text. A preface declared this edition to represent the authentic text of the *Vulgate* and threatened to punish any who dared to alter its text. This "Sixtine edition" raised considerable resentment, and soon after his election in 1592, Clement VIII ordered the withdrawal of all copies, claiming that the printing was faulty. In fact the surviving copies of the Sixtine edition show evidence of careful in-house correction by pen or overpasting. Clement's actions were evidently motivated by animosity toward his predecessor. A new edition was prepared under Clement's auspices which differ from the Sixtine text in about 5,000 places, presenting a text closer to the Leuven editions. To circumvent the solemn bulls protecting the integrity of Sixtus' edition, Clement's edition was published in 1592 under Sixtus' name. Clement's name only appears on the title

page from 1604 onward. Yet even this 1592 edition contained some printing errors and editorial problems; the definitive text was presented in a 1593 quarto edition. This "Sixto-Clementine" edition remained the authoritative text of the Roman Catholic Church until 1907, when Pius X commissioned a group of Benedictines to edit Jerome's text even more accurately.

The *Vulgate* was not the only Latin translation of the bible available to sixteenth-century readers. In 1515, Felix Pratensis translated the *Psalms* literally from Hebrew into Latin. In 1526, the Basel printer Andreas Cratander published an anonymous Latin translation of the *Septuagint*. Between about 1493 and 1520, the Italian theologian Sanctes Pagninus (1466–1541) undertook the first complete translation of the bible from the Hebrew and Greek in modern times. Pagninus' translation appeared with papal privileges at Lyon in 1528, after some delays. In 1535, Sebastian Münster published a new Latin translation of the Hebrew Bible, which served as the basis for several vernacular versions. In 1551, Sebastian Castellio published his Latin translation of the complete bible from Hebrew and Greek, notable for its use of classical Latin vocabulary in preference to words familiar from the *Vulgate*. Castellio's work was attacked by Bèze and other Calvinists. In 1556–1557, Robert Estienne, who had moved his workshop to Geneva, published a Latin Bible containing the *Vulgate*, Pagninus' version of the Hebrew Bible, Claude Baduel's reworking of the Latin translation of the Apocrypha from the Complutensian edition, and a new annotated Latin translation of the New Testament by Théodore de Bèze, which would be reprinted many times in several revisions. In 1577–1579, the Frankfurt printer Wechel released a new Latin translation of the Hebrew Bible and Apocrypha by Immanuel Tremellius and Franciscus Junius (Further, see Gomez-Géraud 2008; and Gordon and Cameron, in Cameron 2016, 187–216).

The Hebrew Bible in the Age of Print

Jewish printers, mainly in Italy and Iberia, produced editions of the Hebrew Bible and Jewish

literature with Hebrew type from an early period. The first printed edition of any part of the bible in Hebrew was the text of the *Psalms* embedded in the commentary of Kimchi, published in 1477, probably at Bologna. The first printed Hebrew Pentateuch (Bologna, 1482) also contained the Targum attributed to Onkelos and the commentary of Rashi. This edition already contains vowel points and accents. Some copies were printed on vellum. Early editions of the Hebrew Pentateuch were also produced at Faro (1487), Hajar (1490) and Lisbon (1491). The first edition of the Prophetic Books was printed (without vowel points or accents) at the press of Joshua Solomon at Soncino in 1485. The Hagiographa (i.e., the books apart from the Law and Prophets) appeared at Naples in 1486–1487. The first complete printed Hebrew Bible, based on manuscripts of the Franco-German type, and including vowel points and accents, appeared at Soncino in 1488. An edition printed probably at Naples in 1491 gives the text of the complete Hebrew Bible based on Sephardic manuscripts. Some copies of this edition were printed on vellum. The text printed at Brescia (Pentateuch 1492, complete Hebrew Bible 1494) was influenced by the 1488 Soncino edition and utilized additional manuscripts of the same type. Some of its deficiencies were corrected from further manuscripts in the editions of Sebastian Münster (1535) and Robert Estienne (1539–1540, 1544–1546). The first rabbinic bible, containing the Hebrew text and several of the Targums, was edited by Felix Pratensis, working largely from the 1488 Soncino edition, and printed by Daniel Bomberg at Venice in 1517. The second rabbinic bible, edited by Jacob ben Hayyim (1524–1525), contained the Hebrew text, several Targums, and (for the first time) the Masora (mediaeval textual and exegetical notes). This edition long served as the *Textus Receptus* of the Masoretic text. Some Jewish printers set up presses in the Ottoman Empire. For example, in 1546, Eliezer ben Gershom Soncino, who ran a press at Istanbul, printed a Pentateuch in Hebrew, with the Targum of Onkelos, the Persian version of Jacob ben Joseph Tawus (printed in Hebrew letters), the Arabic translation of Sa'adya Gaon, and the commentary of Rashi. In 1547 Soncino

printed a Pentateuch in Hebrew along with translations into Aramaic, Castilian, and modern Greek (Further, see Mandelbrote, in Cameron 2016, 82–109).

Sixteenth-Century Developments: Reuchlin, Lefèvre d'Étaples, Erasmus

Humanistic study of the bible in the early sixteenth century, which included text-critical and interpretive aspects, was advanced by three important scholars: Johannes Reuchlin, Jacques Lefèvre d'Étaples, and Desiderius Erasmus. The German Johannes Reuchlin, one of the first northern Christian scholars to embody the ideal of the *vir trilinguis*, skilled in Latin, Greek, and Hebrew, began his studies in Hebrew and Greek as a student in Paris, and later deepened his knowledge through private lessons. After studying law at Orléans and Poitiers, he was appointed as a legal officer at the court of Württemberg. At Florence he met Pico and Ficino and became fascinated with the possibility that Cabala might reveal truths of Christianity. His importance for biblical philology lies particularly in his publication of a Hebrew grammar, based on those of Joseph and David Kimchi, but adapted to the arrangement of Priscian's late-antique Latin grammar. Although it sold quite poorly, Reuchlin's Hebrew grammar was used by several influential biblical scholars, such as Luther and Zwingli. Reuchlin also published a work on the accents and orthography of Hebrew and an edition of the seven penitential *Psalms* with Latin translation. Another short Hebrew grammar by Wolfgang Capito appeared in Conrad Pellikan's 1516 edition of the Hebrew Psalter (Dall'Asta 2020).

The French humanist Jacques Lefèvre d'Étaples was deeply influenced by recent Italian thinkers, notably Ficino, Pico, and Ermolao Barbaro. Like Valla, he espoused a return to patristic theology. He was also influenced by mysticism and edited works by Nicolaus Cusanus, Ficino's Latin translations of the *Hermetica* and Traversari's translation of pseudo-Dionysius. Lefèvre worked closely with the reformer Guillaume Briçonnet, bishop of Meaux, but they were prevented from carrying out their reforming

program by accusations that they espoused evangelical beliefs. Lefèvre promoted biblical philology in his editions of the *Psalms* and commentaries on Paul. In 1509 Lefèvre published his *Quincuplex Psalterium* (*Fivefold Psalter*), which juxtaposed five different Latin translations of the *Psalms*. In the first section, he gives the Gallican Psalter, the Roman Psalter, and the “Hebraic” version – that is, Jerome’s revision of the Roman Psalter according to the Hebrew text – in parallel columns. He then gives a paraphrase (*expositio continua*), notes on the differences between the three versions, and (for Pss 1–25) a commentary providing Scripture parallels. In the second section, he gives the “Old psalter” (*Psalterium Vetus*), an Old Latin text evidently extracted from Augustine’s *Enarrationes in Psalmos*, similar to that recorded in Verona, Biblioteca Capitolare Cod. I (1), and a “reconciled psalter” (*Psalterium conciliatum*), Lefèvre’s own version. Lefèvre adopts Cusanus’ strongly Christological manner of reading the *Psalms*, which understood them as announcing the salvation of humanity through Christ. Lefèvre distinguished two kinds of literal sense: he describes one as the dead, rabbinic manner of reading, according to which the *Psalms* refer to David; and characterizes the other as the living, prophetic reading, which recognizes that the *Psalms* refer consistently to Christ. Lefèvre believed that a persistently Christological reading of Scripture revealed its internal consistency. Apparently reflecting ideas from the *Devotio Moderna*, Lefèvre emphasized that meditative reading of Scripture conforms us to Christ. Lefèvre’s edition of Paul’s letters with commentary (1512) included the canonical letters as well as the spurious Epistle to the Laodiceans and the pseudonymous correspondence between Paul and Seneca. Again Lefèvre submits these letters to a Christological manner of reading, arguing that they transmit the teaching not of Paul, but of Christ himself. In parallel columns he gives the *Vulgate* and his own Latin translation from the Greek. His extensive commentary details many places where the *Vulgate* does not adequately reflect the Greek. In 1521, Lefèvre completed a commentary on the Gospels (*Commentarii initiatorii in quatuor*

evangelia). The body text is the *Vulgate*. At the end of each chapter, Lefèvre supplies short notes providing the corresponding words in Greek and possible Latin synonymns preferable to Jerome’s rendering. In his commentary he espouses identifiably Roman Catholic doctrines, such as Purgatory and the Immaculate Conception, as well as others that suggested evangelical sympathies, such as his insistence that the Word is entirely sufficient for eternal life. He emphasized that knowledge of Hebrew and Greek was a necessary precondition for interpreting the bible. Furthermore, he hoped that his commentaries would lead his readers to true repentance, that is, a change of heart, to the exercise of good works, a pious life and spiritual ascent. In 1523, Lefèvre published his French translation of the Gospels, based on the *Vulgate*; a translation from the Greek was potentially too controversial. This was not the first French translation, but it was the first to achieve a broad readership. In 1527, he published a commentary on the Catholic Epistles, containing the *Vulgate* text corrected against the Greek. Lefèvre’s attempts to promote piety through knowledge of the Scriptures attracted considerable hostility from conservative theologians, principally those from the Sorbonne, who suspected his motivations and orthodoxy (Schönauf 2020).

Desiderius Erasmus, the greatest biblical philologist of the early sixteenth century, studied theology at the University of Paris, an institution he disliked intensely, but developed into a humanist scholar through his own efforts. Like many humanists, he preferred a rhetorical, ethical philosophy to the scholasticism that still dominated Renaissance universities. He learned Greek in England. In Leuven, he discovered Valla’s *Collationes* on the New Testament, which he published in 1505. Resolving to continue Valla’s mission of constructing a reliable text of the New Testament, Erasmus collated Greek and Latin manuscripts in Italy, England, and Switzerland, with the aim of using the variants to edit a revision of the *Vulgate* text of the New Testament. He undertook this revision in stages between about 1512 and 1516, changing some parts quite extensively and leaving others relatively untouched. Finally, he wrote a detailed commentary on his version of the New Testament, in which

he referred constantly to places where the *Vulgate* varied from the Greek manuscripts and from the Scriptural citations in the early Greek and Latin Fathers.

Erasmus was not the only person carrying out philological work on the New Testament. As he worked, he encountered Lefèvre's work on Paul. At Alcalà (Latin *Complutum*) in Spain, another editorial team was engaged in editing the entire bible. While the first volume of the Complutensian Polyglot Bible, containing the New Testament, was printed in 1514, the editors planned to wait until all six volumes were complete before publishing the edition as a single work. In the meantime, Froben began printing Erasmus' *Annotations* in late 1515. The other volume of the work, containing Erasmus' revision of the *Vulgate* and a parallel Greek text based on a few manuscripts available to him at Basel, was finished by March 1516. Due to the haste with which Erasmus' edition was put together, the text was quite faulty, and far inferior to that of the Complutensian edition. In the influential introductory materials, Erasmus outlined a pious "philosophy of Christ," a humane morality based on an intimate knowledge of the bible, which he wished to place in the hands of even the simplest readers. Erasmus continued to refine the text and commentary and published new editions in 1519, 1522, 1527, and 1535. His Latin version also appeared in several diglot editions, alongside Luther's German version (1535, 1556), Olivétan's French (1552), Brucioli's Italian (1558), and Tyndale's English (1538, 1548–1549, 1549, 1550). Between 1518 and 1524, Erasmus also produced paraphrases of the New Testament (excluding Revelation), which combined translation and devotional reflection. Erasmus' criticisms of the *Vulgate* and of aspects of ecclesiastical doctrine drew him into numerous bitter struggles (De Jonge 1988; Krans 2006; McDonald 2016; Wallraff et al. 2016).

Philologically Significant Printed Editions of the Bible

The privileges granted to Erasmus' edition probably contributed to the delayed publication of the

Complutensian Polyglot Bible. When it finally appeared in 1520, this edition gave scholars access to several versions in parallel columns, some for the first time. The Old Testament volumes contained the Hebrew text, the *Septuagint*, the Aramaic (only in the Pentateuch, but with Latin translation) and "primitive" versions of the Hebrew and Aramaic, while the New Testament volume contained the Greek and *Vulgate*; an additional volume contained grammars and lexica to assist the reader. The *Vulgate* was corrected against early Latin manuscripts and the Greek text. Although the vowel pointing of the Hebrew text is inadequate, the consonantal text is very accurate. As an interlinear translation of the *Septuagint* Psalter, the editors provided Jerome's "Roman" version. Despite his disputes with Stunica, one of the editors from Alcalá, Erasmus seems to have consulted the Complutensian edition when preparing his 1522 edition of his Latin-Greek diglot New Testament, if not then certainly for his 1527 edition.

In summary: the first Greek New Testament *printed* belonged to the Complutensian Polyglot Bible (1514); the first Greek New Testament *published* was Erasmus' Latin-Greek diglot (1516), discussed above. These were preceded by isolated editions of the Greek Psalter in the fifteenth century: a Greek-Latin Psalter (Milan, 1481) and Greek liturgical psalters (Venice, 1486 and c. 1498). (For these and the other printed editions discussed here, see the descriptions in Darlow and Moule 1903–1911.) The first complete printed Greek Bible was published by Andrea Asolano, father-in-law of Aldus Manutius and heir of his workshop, in 1518. The text of the *Septuagint* is based on manuscripts from Bessarion's library. The New Testament generally follows Erasmus' 1516 edition, with some readings from elsewhere. The first attempt at a critical Greek text was issued (and perhaps edited) by the Parisian printer Simon de Colines (1534); this edition was based on Erasmus' 1522 text, drawing further readings from the Complutensian edition and from manuscripts. Its text contains numerous good, pre-Byzantine readings, but a number of these may have been chosen to make the Greek text agree with the *Vulgate*. Despite its qualities,

this edition seems to have found little following. In 1546 appeared the first Greek edition of Robert Estienne, based on Erasmus' 1535 edition, the Complutensian edition, and a collation of 15 manuscripts carried out by the printer's son Henri. Estienne's editions are distinguished by the beautiful fonts, commissioned by François I from Claude Garamond. Estienne's third edition (1550), the "royal edition" (*editio regia*, 1550), which presented the variants collated by Henri Estienne in a critical apparatus, proved highly influential. A successful innovation in Estienne's Greek-Latin edition of 1551 was the introduction of the present verse divisions. From 1565, Théodore de Bèze, Calvin's successor at Geneva, published a series of influential editions of the Greek New Testament, which included changes based largely on the collations made by Henri Estienne. However, Bèze's claims about the number of manuscripts he had consulted were inflated, and his use of variants was unsystematic. The Elzevier printing firm in Leiden published an edition in 1633 which Daniel Heinsius, author of its preface, dubbed as the "standard text" (*Textus Receptus*). This edition, based principally on Bèze's text, assumed a canonical status which later critical editors such as Mill (1707) and Griesbach (1775–1777) found difficult to displace, even when it became clear that the Byzantine text it presented was neither the oldest nor the best text form recoverable (De Jonge 1971).

The *Septuagint* attracted less attention from late sixteenth-century textual critics, but a team of scholars under the patronage of Sixtus V produced a canonical edition in 1586–1587, based on previous editions, *Codex Vaticanus* and other manuscripts. An accompanying Latin translation appeared in 1588, consisting of fragments of the *Vetus Latina*, filled in where necessary by the editorial team, led by Flaminio Nobilius.

The increasing expertise of Western Christian scholars in oriental languages led to the production of several Polyglot Bibles in the sixteenth and seventeenth centuries. (see Hamilton, in Cameron 2016, 138–156.) Three polyglot psalters appeared in rapid succession at about the same time as the Complutensian edition: one in Hebrew, Latin, Greek, Arabic, and Aramaic (the Targum), edited

by Agostino Giustiniani, assisted by Jacobus Furnius and Baptista Cigala (Genoa, 1516); another in Hebrew, Greek, Ge'ez (Ancient Ethiopic), and Latin, edited by Johann Potken, assisted by Johann Soter (Cologne, 1518); and one in Hebrew and Greek, with Latin translations of each (Basel, 1518). The next major fruit of the "oriental turn" among Christian scholars was the Antwerp Polyglot Bible, edited under the direction of Arias Montano and printed in eight volumes by Christophe Plantin (1569–1572). Besides the Latin Vulgate, this edition contains the Hebrew, Aramaic, Greek, and Syriac, with Latin translations of each. The Hebrew, Aramaic, and Greek texts were based on the Complutensian edition, improved through collation with later editions and manuscripts. The Syriac was based on Widmanstetter's 1555 edition, improved with manuscript readings. This edition served as the basis of many partial reprints. A Hexaglot Bible, edited by Elias Hutter and printed at Nuremberg in 1599, was completed only to Ruth. Hutter's curious edition of the New Testament in 12 languages (1599–1600) included his own Hebrew translation; regrettably, he altered the Greek text for doctrinal reasons and inserted entire books into the Syriac which were not original parts of that tradition. The next great Polyglot Bible, a revision of the Antwerp edition, appeared at Paris between 1629 and 1645. The editorial team included two Maronites, who established the Syriac and Arabic texts. The Paris Polyglot Bible also contained the Samaritan Pentateuch and Samaritan Targum for the first time, with Latin translation. The great Polyglot Bible printed at London in 1655–1657, under the editor Brian Walton, was distinguished by its accuracy and the addition of the Ethiopic and Persian texts.

Early Translations of the Bible in Print

Several early translations of the bible were printed during the Renaissance. Parts of the Slavonic Bible, translated piecemeal from the ninth century onward, already appeared in print in the fifteenth century. A Psalter in a composite recension of the Bulgarian and Russian types was printed at

Cracow in 1491. The Serbian recension of the psalter was printed at Cetinje in 1495. The Slavonic Gospels were first printed at Tirgovişte in 1512. A Slavonic Apostolos (a volume containing Acts and Epistles) was printed at Moscow in 1563–1564, the first book printed in Russia. An edition of the *New Testament and Psalms* was printed at Ostrog in 1580. For the first complete Slavonic Bible, printed at Ostrog in 1580–1581, the text was checked against the Greek and Latin. An edition of the *Psalms* and *Song of Solomon* in Ethiopic was printed at Rome in 1513; a complete Ethiopic New Testament was printed at Rome in 1548–1549. The Arabic Psalms were included in the 1516 Genoa Psalter; an Arabic translation of Galatians appeared at Heidelberg in 1583 and the Gospels (from ms Vat. Copt. 9) at Rome in 1590–1591. The first edition of the Syriac Peshitta of the New Testament, translated in the fifth century, was edited by Johann Albert Widmanstetter and Moses of Mardin and printed at Vienna in 1555 from specially cut types. Widmanstetter also published a short Syriac grammar (1555–1556) to allow readers access to the text. Immanuel Tremellius, a convert from Judaism to Christianity, appointed as professor of Hebrew at Heidelberg, published a second edition of the Syriac Peshitta New Testament at Geneva in 1569, printed with Hebrew types. This edition also contains the *Vulgate* and a Latin translation of the Syriac, as well as a grammar of Aramaic and Syriac. For the Antwerp Polyglot, Guy Lefèvre de la Boderie revised Widmannstetter's edition, using a further manuscript from Damascus. Two independent editions of the Syriac psalter were published in 1625, at Leiden and Paris. The four shorter Catholic Epistles (2 Peter, 2 and 3 John, Jude), omitted from the Peshitta, are included in another Syriac translation, the Philoxenian text, edited in 508; these letters were first edited from a manuscript in the Bodleian Library in 1630. Two manuscripts (a Gospel manuscript and an Apostolos) containing the revision of the Syriac New Testament undertaken by Thomas of Harkel in 616 were sent from Diyarbakır to England in 1730. The text of the Gospels from one of these manuscripts was edited by Joseph White and printed at Oxford in 1778. The bible was translated into Armenian in the fourth or

fifth centuries; the *Psalms* were printed at Rome in 1565, the entire bible at Amsterdam in 1666. A Coptic Psalter was printed at Leiden in 1663; the first complete printed *Coptic New Testament* appeared at Oxford in 1716. A Persian translation of the Gospels in Arabic characters, edited from three manuscripts by Abraham Wheelocke, was printed at London along with Wheelocke's Latin translation, in 1652–1657. Ulfila's Gothic Gospels were first printed in 1665. An edition of the Anglo-Saxon Gospels from Bodleian ms 441 was printed in 1571.

Vernacular Translations in Print

Many translations of the Latin Vulgate into various European vernacular languages were made during the Middle Ages, and some of these appeared in print already in the fifteenth century. Translations from Hebrew and Greek only began in the sixteenth century. Following the publication of Erasmus' New Testament in 1516 and the Complutensian Polyglot Bible in 1520, a flurry of translation into various vernacular languages began in the 1520s. Many were motivated by the theological emphases of one or other party in the Reformation, though ostensibly Catholic or Evangelical translations often show the influence of versions published by their opponents.

An interesting confluence of different textual traditions may be seen in the translations into Ruthenian (Belarusian) by the physician and printer Franciscus Skaryna (c. 1486–before 1541), who worked from the Latin Vulgate, with reference to the Slavonic. It seems that Skaryna intended to translate the entire bible. The surviving parts were printed as individual books, in Cyrillic characters, at Prague (1517–1519) and Vilnius (1525) (Sadoŭski 1970).

Several German Bibles and Psalters based on the Latin Vulgate were printed before the Reformation. Luther began translating the New Testament into German from the second edition of Erasmus' Latin-Greek diglot (1519) in late 1520 and continued the task while in enforced exile on the Wartburg. The translation, finished on 21 September 1522, was an instant success. The

Wittenberg printer Melchior Lotter the Younger had already produced two editions by the end of 1522. Printers in Basel, Strasbourg, and Augsburg soon reprinted the work, adapting Luther's language to local dialect conditions. Luther's German Old Testament, translated from the 1494 Brescia edition, with reference to the *Vulgate*, *Septuagint*, and the Latin versions of Pagninus and Münster, was printed in several instalments between 1523 (*Genesis to Song of Solomon*) and 1532 (Prophets); the first complete edition, carefully revised, was printed at Wittenberg in 1534. Jacob Beringer and Hieronymus Emser made superficial revisions of Luther's New Testament for Roman Catholic readers, which appeared in 1526 and 1527. A German translation of the Prophets from the Hebrew by the Anabaptists Ludwig Hätzer and Hans Denck appeared in 1527, thus predating Luther by 5 years. The printer Froschauer published the first "Zurich Bible" in 1527–1529. It contained the books Luther had already published to that point (*Genesis to Song of Solomon*; New Testament), adapted to the Swiss dialect, alongside the Prophets translated by the ministers of Zurich and the Apocrypha by Leo Jud. Variant reprints of this edition appeared soon at Worms, Augsburg, Strasbourg, and Frankfurt. Once Luther's Old Testament was complete, a Low German version was prepared by Johann Bugenhagen and printed at Lübeck in 1533–1534. Luther revised his translation in 1539–1540 in consultation with his colleagues Melancthon, Bugenhagen, Jonas, Cruciger, and Aurogallus; this revision was printed at Wittenberg in 1541. Luther's definitive text was printed in 1545. Luther's version became a foundation for the modern German language. In time, editions printed even far from Saxony included ever fewer dialectal changes, as his linguistic usage became normative. The triumph of Luther's High German version in time reduced Low German to the level of a dialect.

In 1522, Jan Pelt published his Dutch translation of the Gospel of Matthew from the *Vulgate*, corrected according to the Greek. A Dutch version of the New Testament printed at Antwerp by Hans van Roermonde in 1525 was based on two earlier Dutch versions of portions of the New Testament.

In 1523–1526, several editions of the Dutch New Testament based on Luther's German translation appeared, most at Antwerp. The Delft printer Cornelis Lettersnijder published the first Dutch New Testament claiming to be based on Erasmus' Greek and Latin text in 1524. A Dutch Old Testament, in which the Pentateuch and *Psalms* are based on Luther and the rest on the *Vulgate*, appeared in 1525. The first Dutch Psalter based on the Hebrew appeared in 1526, printed at Antwerp by Merten de Keyser (the Basel impressum is false). Further versions appeared in 1531 and 1534 (the latter by Jan Campensis). In 1526, the Antwerp printer Jacob van Liesvelt published a Dutch Bible based on those books which Luther had already published in translation; for the rest, earlier Dutch versions and Oecolampadius' Latin translation of Isaiah (1525) were used. In Liesvelt's later editions, Dutch versions of Luther's translations progressively replaced the older material. In 1528, Willem Vorsteman printed an adaptation of Liesvelt's edition, containing some revisions more palatable to Roman Catholic readers, and with marginal comments providing alternative translations from the original languages as presented in the Complutensian Polyglot Bible. The appeal to the impeccably orthodox Spanish edition concealed the evangelical origins of some of the material in Vorsteman's bible. Many of these Dutch editions contained paratexts intended to guide lay readers; those whose contents seemed suspiciously evangelical often attracted the attention of the Inquisition. In 1618–1619, a new translation of the complete bible from Hebrew and Greek was planned at the Calvinist Synod of Dort. This canonical translation finally appeared, authorized by the States General, in 1636–1637.

Lefèvre's French translation of the Gospels, a revision of an earlier version made with reference to the *Vulgate*, appeared in 1523. His translation of the complete bible was printed at Antwerp in 1530, with imperial privilege, and reprinted in 1534. The French Protestant Pierre Robert Olivétan thoroughly revised Lefèvre's bible according to the Hebrew and Greek, with reference to Sanctes Pagninus' Latin translation of the Hebrew Bible and Erasmus' Latin New

Testament. Calvin supplied a preface to Olivétan's edition, which was first published at Serrières (Neuchâtel) in 1535. A revision appeared at Geneva in 1540. Etienne Dolet's psalter, translated from Latin into French, appeared in 1542. A further revision of Lefèvre's bible made by members of the theological faculty of Leuven was published in 1550. A French translation of the complete bible from the Hebrew and Greek by the heterodox Calvinist Sebastian Castellio, printed at Basel in 1555, was censured by Geneva but later appreciated for its idiomatic qualities. René Benoist published a revision of a 1561 Geneva Bible for Roman Catholic readers in 1566. A revision of the complete bible made by the Genevan professors and pastors Bertram, Bèze, La Faye, Jacquemot, Goulart, and Rotan was printed in 1588 and was long regarded as definitive (Chambers 1983). A translation of the New Testament into Vaudois dialect revised according to Erasmus' Greek in the second quarter of the sixteenth century survives in manuscript (Zurich, Zentralbibliothek, ms. C 169 [706]), and was only published in 1890.

The first Danish New Testament (1524) was translated from Erasmus' Latin version and Luther's 1522 German translation. The first Danish New Testament based on the Greek, translated by Christiern Pedersen, appeared in 1529. The first Danish Psalter based on the Hebrew text, translated by Frants Wormordsen, was printed in 1528. The first complete Danish Bible, based on Luther's German version, appeared in 1550.

An English translation of the complete *Vulgate* Bible was made under the leadership of the Oxford reformer John Wycliffe in the 1380s and 1390s and circulated in manuscript until the sixteenth century, despite official attempts at suppression due to its association with radical Lollardy. The earliest English translation of the New Testament translated from Greek – with reference to Erasmus' Latin and Luther's German versions – was done by William Tyndale. Printing of the first edition was begun at Cologne in 1525 but was interrupted before it was finished. The first edition completed was printed at Worms by Peter Schöffer the Younger in 1526. Tyndale's translation of the Pentateuch from Hebrew – again made with reference to the

Vulgate and Luther's version – was printed at Marburg in 1530. His translation of Jonah appeared at Antwerp, probably in 1531. He published corrected editions of his New Testament at Antwerp in 1534 and 1535, before being assassinated near Brussels. The first English translation of the complete bible, made by Miles Coverdale principally on the basis of the Latin version of Pagninus and the German translation by Zwingli and Leo Jud (Zurich, 1524–1529), was printed in 1535 (place of printing uncertain). By 1537, Henry VIII had changed his policy toward English translation of the bible and granted James Nicholson permission to print bibles at Southwark. "Thomas Matthew" (perhaps a pseudonym for John Rogers) made a redaction of the whole bible combining the work of Tyndale, Coverdale, and Olivétan, which was printed (probably at Antwerp) for the London printer-publishers Grafton and Whitchurch in 1537, with a royal license obtained by Cromwell. Matthew's bible was in turn revised by Richard Taverner, a competent Hellenist in Cromwell's employment (London, 1539). Under Cromwell's patronage, Coverdale also revised Matthew's edition, using Sebastian Münster's Latin translation of the Hebrew Bible, the *Vulgate*, Erasmus' Latin version, and the Complutensian Polyglot Bible. By the time this "Great Bible" appeared, Cromwell had already instructed the clergy to set up a copy in each church for consultation by the laity. To meet demand, this edition was reprinted several times. The psalter for the Book of Common Prayer was taken from this edition. In 1547, Edward VI decreed that copies of an English translation of Erasmus' *Paraphrases of the New Testament* should also be freely available for consultation in churches around England, and an edition duly appeared in 1549. During the reign of Mary Tudor, several Protestant theologians left England for the Continent. One of those who settled at Geneva, William Whittingham, revised Tyndale's New Testament using the Great Bible and the 1556 Latin version of Théodore de Bèze. Whittingham's edition was published at Geneva in 1557. Whittingham revised his New Testament further and worked together with Anthony Gilby, Thomas Sampson, and others on a new complete bible, printed at Geneva by Roland Hall in 1560. The

Geneva Bible was the first complete English bible printed in Roman type and the first to contain the verse divisions first introduced in Estienne's 1551 Greek edition. (These typographical features had already appeared in Whittingham's 1557 New Testament.) This *Geneva Bible* was reprinted more than 140 times until 1644 and was particularly popular with Calvinists and Puritans, who appreciated its anticlerical marginal commentary, its resolutely Protestant translation choices and the inclusion of Calvinist catechisms in many editions; further distinctively Calvinistic annotations by Laurence Tomson were added in 1587 (Metzger 1960). Archbishop Matthew Parker, assisted by a committee of bishops, wished to supplant the *Geneva Bible* with a revision of the Great Bible, made according to the Hebrew and Greek. Despite official promotion, the resulting *Bishop's Bible* (1568) failed to achieve its purpose. Roman Catholic readers, no doubt offended by the violently anti-papal annotations in the *Geneva Bible*, preferred Gregory Martin's English translation of the New Testament, made primarily from the "authentic" *Vulgate*, with an eye to the Greek (Reims, 1582). A Catholic translation of the Old Testament, a complement to Martin's New Testament, corrected against the *Sixto-Clementine Vulgate*, was first printed at Douai in 1610–1611. A plan to revise the Bishops' Bible, proposed by the Puritan John Reynolds in 1604, was supported keenly by King James I (VI), who disliked the revolutionary tone of the *Geneva Bible*. The preliminary work, carried out by 3 teams of about 50 translators over 4 years under the direction of Lancelot Andrewes and the Hebraists Edward Lively and John Harding, was submitted to mutual examination and a final revision by a committee of 6 members over 9 months. This *Authorised Version*, published in 1611, was made primarily from the Hebrew and Greek (in a text close to the 1598 edition of Bèze), with reference to the versions of Tyndale, Matthew, and Coverdale, the Great Bible and the *Geneva Bible*, while the 1582 Rheims New Testament played an unacknowledged role in the drafting process (Greenslade 1963, 141–174; Herbert 1968).

The first Swedish translation of the New Testament (Stockholm, 1526), attributed to Olaus

Petri (c. 1493–1552), was based on Luther's German and the 1522 edition of Erasmus' Latin-Greek diglot. It was immediately condemned by Roman Catholics. A Swedish Psalter, likewise based on Luther, was printed at Stockholm in 1536. The first complete Swedish Bible, ascribed to Laurentius Petri, based on Luther and the *Vulgate* in the Old Testament, and Luther and Erasmus in the New, was printed at Uppsala in 1540–1541. A revision commissioned by Gustavus Adolphus was printed at Stockholm in 1617–1618 and served as the basis for many reprints.

The entire bible was translated from the *Vulgate* into a standardized dialect of Italian, based on Tuscan with some Venetian features, in the thirteenth century. The Camaldolese monk Niccolò Malermi (c. 1422–1481) retranslated or reworked some of this older material; his version was first printed at Venice in 1471 and was reissued several times over the following century. A new Italian translation of the entire bible by Antonio Brucioli (c. 1498–1566) was printed at Venice between 1530 (New Testament) and 1532 (complete bible, including Old Testament Apocrypha). Although the title page of the 1532 bible claims that Brucioli translated from the Hebrew and Greek, it seems that he leaned heavily on the Latin translations by Pagninus and Erasmus. For Brucioli's denunciation of the church's policy of discouraging vernacular translations of the bible, his version was placed on the Index in 1559. A "new" translation by Santi Marmochino (1538) was simply a reworking of Brucioli's version, made to conform more closely to the *Vulgate*; another revision of Brucioli, by Giovanni Luigi Pascale, was published in 1555. Massimo Teofilo undertook a new Italian translation of the New Testament from Greek, published at Lyon in 1551 and 1556 with a translation of Calvin's preface to Olivétan's French version (1535).

Polish translations of individual books (*Ecclesiastes*, *Psalms*, *Tobit*) were printed at Cracow from 1522 onward. The first complete Polish New Testament, translated from the Greek (with reference to the *Vulgate* and other versions) by Jan Sieklucki, was printed at Königsberg (Kaliningrad) in 1552–1553. A Polish translation made from the

Vulgate for Catholic readers was printed at Cracow in 1556. The first complete Polish Bible was edited by Jan Lwowczyk (Cracow, 1561). Although it claims to render the Latin Vulgate, it shows the influence of the Bohemian Bible of 1556–1557, while its woodcuts derive from a Lutheran model. The second Polish translation of the complete bible was carried out over 6 years by a distinguished team of scholars at the estate of Nicolas Radziwiłł. It was printed at Brześć (Brest) in 1563 by Bernard Woiewodka, whose press had been brought specially from Cracow. Because the translation team included some Socinians, many Lutherans and Calvinists declined to use this edition, and a Roman Catholic member of Radziwiłł's family destroyed all the copies he could find. The Socinian Szymon Budny undertook a revision of the *Brest Bible*; the New Testament appeared in 1563, 1568, and 1570 and the complete bible in 1572. A further revision by the Socinian Marcin Czechowicz was printed at Raków in 1577; this edition was in turn revised by the Socinian Valentin Schmalz (Raków, 1606). A versified psalter by Jan Kochanowski was first printed at Cracow before 1578 and reprinted often. Pope Gregory XIII commissioned the Jesuit Jakub Wujek to prepare a new Polish translation of the *Vulgate* for Catholic readers; the New Testament appeared in 1593, the *Psalms* in 1594, and the complete bible in 1599. Wujek's annotations draw on Bellarmino and the English New Testament printed at Reims in 1582. His translation became standard for Catholic readers. The revision of the *Brest Bible* undertaken by Mikołajewski and Turnowski (Gdańsk, 1632) established itself as a standard among Protestant Poles; the archbishop of Gniezno ordered that all copies should be burned.

A Czech translation of the New Testament made by Beneš and Gzel from Erasmus' Latin version was printed in 1533. The first New Testament translated from Greek was made by Jan Blahoslaw, bishop of the Bohemian Brethren; it was printed in 1564. The first complete Czech Bible translated from the original languages appeared at Kralitz in 1579–1593, at the instigation of Blahoslaw (Mánek 1981).

A fifteenth-century translation of the letters of Paul from the Latin *Vulgate* into Hungarian was

published at Cracow in 1533. A Hungarian translation of the Gospels by Gábor Pesti, based on Erasmus' edition, appeared at Vienna in 1536. The first complete New Testament in Hungarian translated from the Greek was undertaken by János Erdösi (Silvester), a student of Melancthon, and printed at the press established on the estate of Tamás Nádasdy on Új-sziget. An incomplete translation of the Old and New Testaments undertaken by a team headed by Gáspár Heltai, another student of Melancthon, appeared at Koloszvár (Cluj-Napoca) in 1552–1565. The first complete Hungarian translation of the Hebrew Bible and New Testament from the Hebrew and Greek was made by the Calvinist pastor Gáspár Károli and appeared in 1590; this translation was reprinted more than 100 times. A Roman Catholic translation intended to counter the influence of Károli's version was undertaken by the Jesuit György Káldi (1626).

An Icelandic version, by Oddur Gottskálksson, based on the Latin *Vulgate*, with reference to Luther's German version, was printed at Roskilde in 1540. The first complete bible in Icelandic (1584) was translated by bishop Gisli Jonsson, who also included fragmentary material by other recent scholars. King Frederick II of Denmark funded the publication of this fine translation and prescribed its use in Iceland.

Translations of parts of the New Testament into Hebrew appeared in print during the sixteenth century. In 1537, Sebastian Münster published a Hebrew version of the Gospel of Matthew made in 1385 by Shem Tov ibn Shaprut, along with his own Latin translation. Shem Tov's translation was published again by Cinquarbres at Paris in 1551. In 1555, bishop Jean du Tillet published another edition, based on a manuscript from Rome, with a Latin version by Jean Mercier. In 1557, Münster published a Hebrew translation of the Epistle to the Hebrews. In 1574, a Hebrew version of Luke's Gospel by the Lutheran Hebraist Fredericus Petri appeared at Wittenberg. The following year, a version of Mark by Walter Herbst, a Jewish convert to Lutheranism, likewise appeared at Wittenberg. The New Testament Epistles prescribed in the Lutheran lectionary were published at Leipzig in 1576 in an edition that provides the Greek text

along with Erasmus' Latin version, Luther's German, and a Hebrew translation by Johannes Clajus and Conrad Neander.

A Yiddish New Testament (excluding Revelation) based on Luther's German version by Johann Harzage, a convert from Judaism, was printed at Cracow in 1540. A Yiddish Pentateuch was printed at Constance in 1543–1544; a separate edition appeared at Augsburg in 1544. A Yiddish psalter was printed at Venice in 1545. The Cracow printer Isaac Prosnitz published individual biblical books in Yiddish in the 1580s and 1590s. Another Yiddish adaptation of Luther's New Testament by Elias Schadaeus, which included a work on the conversion of the Jews, appeared at Strasbourg in 1592. Several editions of individual books of the Hebrew Bible in Yiddish rhyming verse appeared from 1544 onward. The first complete Yiddish translation of the Hebrew Bible was printed at Amsterdam in 1676–1678.

The first translation of the New Testament into Finnish was undertaken by Mikael Agricola (c. 1510–1557), a student of Luther and Melancthon (1536–1539), bishop of Turku (1554) and Reformer of Finland. The translation, printed at 1548 at Stockholm, was made from the Greek text, with reference to the Latin version of Erasmus, the German of Luther, and the Swedish of Olaus Petri. Agricola's translation contains numerous neologisms. The first complete Finnish Bible appeared in 1642.

The first translation of the New Testament from Greek into Castilian Spanish was made at Wittenberg by Francisco de Enzinas, a pupil of Melancthon, and printed at Antwerp in 1543. Enzinas travelled to Brussels to present a copy to Charles V but was arrested and imprisoned under suspicion of promoting Lutheranism. After more than a year, he escaped and returned to Wittenberg. Thomas Cranmer later appointed him as professor of Greek at Cambridge. Spanish translations of the *Psalms* from Hebrew began to appear in the 1550s. A Spanish translation of the Hebrew Bible, intended principally for Sephardic Jews driven from Iberia, was printed at Ferrara in 1553. It was apparently based on a version translated by Rabbi Moses Arragel in 1422–1430. Perhaps in

order to make this edition more palatable to the Christian authorities, the preface claims that the editor also used the translation of Sanctes Pagninus, which had been approved by the curia. Furthermore, the publisher solicited approval for publication from the Inquisition. This edition was reprinted several times in the seventeenth century in Amsterdam for the use of the Sephardic community there. A Spanish translation of the New Testament from the Greek by Juan Perez de Pineda, a convert from Catholicism to Calvinism, was printed by Jean Crespin at Geneva in 1556 with a false Venetian imprint and smuggled into Seville in barrels. In 1556 and 1557, Crespin also published Spanish translations of *Romans* and *1 Corinthians* by the Reformer Juan de Valdés. The first complete bible in Spanish, translated by the Reformer Casiodoro de Reina (c. 1520–1594), was printed at Basel in 1569. Reina apparently knew some Hebrew but relied on Pagninus' translation and the *Ferrara Bible*. Reina's translation was later revised by Cipriano de Valera (Amsterdam, 1602). The first translation of the New Testament into Catalan (from the *Vulgate*) was published in 1832.

The first modern translation of the Pentateuch into modern Greek appeared in the 1547 Istanbul Polyglot Bible, printed in Hebrew characters. The first translation of the New Testament into modern Greek, prepared by Maximus of Gallipoli, was published at Geneva in 1638. A modern Greek Psalter appeared at Venice in 1643.

The first bible translation into Slovenian (Reutlingen, 1555) was a version of *Matthew* by Primož Trubar, based on recent Latin, German, and Italian translations, as well as Erasmus' annotations. Trubar's versions of the Gospels and *Acts* appeared in 1557–1558, *Romans-Galatians* in 1560–1561, the *Psalms* in 1566, *Ephesians-Philemon* in 1567, and *Hebrews-Revelation* in 1576–1577, all at Tübingen. Meanwhile, Trubar's colleague, the Lutheran pastor Jurij Dalmatin, was preparing a translation of the complete bible into Slovenian, from Hebrew and Greek but with reference to Luther's German. Individual books were printed at Ljubljana from 1575; the complete work was finally printed at Wittenberg in 1584.

The first translation of the New Testament (from the *Vulgate*) into Upper Engadine Romansh was printed in 1560; the first translation from the Greek was published in 1640. A Lower Engadine metrical psalter was printed at Basel in 1562; the first complete Lower Engadine bible appeared in 1679. The New Testament in Oberland Romansch, translated by Lucius Gabriel, appeared in 1648. A complete Oberland bible, containing Lucius Gabriel's New Testament and an Old Testament translation by Steffan Gabriel, appeared in 1717–1718.

The first translation of the Gospels into Romanian, undertaken by Coresi, was printed at Braşov in 1560–1561. Coresi's translation of *Acts* and the Epistles appeared in about 1563, and the *Psalms* in 1568, likewise at Braşov. A diglot edition of Coresi's psalter with the Slavonic text appeared in 1577. His Gospel translation appeared alongside the Slavonic text in 1580. A Romanian translation of *Genesis* and *Exodus* by Şerban and Marien, presumably intended as the first instalment in a complete translation, was printed at Oraştie in 1582. No Romanian translation of any biblical book appeared between 1588 and 1635. The first complete Romanian New Testament, begun by the monk Silvestru and continued by others after his death, was printed at Belgrade in 1648. The first complete Romanian Bible, translated by Nicolas Milescu, was printed at Bucharest in 1688.

Antonius Dalmata and Stephanus Consul Istrianus, Roman Catholic priests who converted to Protestantism, translated the New Testament into Serbo-Croatian, drawing principally on Erasmus' Latin and Luther's German. Their work was printed at Urach (albeit with a Tübingen imprint) in 1562–1563 in two editions using specially cut fonts, one in Glagolitic characters, the other in Cyrillic. Parts of the Old Testament were printed at the same press in 1564, with woodcuts imitating those of a Wittenberg edition of 1560–1561.

The first Welsh translation of the New Testament, the work of William Salesbury, Richard Davies, and Thomas Huet, was printed at London in 1567. The first complete bible in Welsh, translated by William Morgan from the Hebrew and Greek, with reference to the Latin Vulgate, the Latin version of Pagninus, and the

Geneva Bible, was likewise printed at London in 1588.

The first Irish translation of the New Testament, made from the Greek, was the work of Nicholas Walsh and William Daniel, using types presented by Elizabeth I in 1571 in the hope of encouraging such a translation. Printing lasted from 1595 until 1602, and the edition was duly published in 1603 with a dedication in English to the new monarch James I. The first Irish translation of the Old Testament was carried out by William Bedell (1571–1642), though it was not published until 1685, when it was issued at London, uniform with an edition of the New Testament published in 1681. Some copies were sent to the Highlands of Scotland. A handy one-volume Irish Bible in duodecimo was printed in 1690, principally for use in Scotland. The first New Testament in Scots Gaelic, translated from Greek by James Stuart, minister of Killin, was printed in 1767.

The first complete New Testament in Portuguese was published at Amsterdam in 1681, translated by João Ferreira d'Almeida, a convert from Catholicism to Calvinism, on the basis of Bèze's Latin version, for use in the Portuguese communities of the East Indies.

The bible also played a role in international missionary activity. According to John Saris (1613), the Jesuit college at Kyoto, founded by the Portuguese, included several native Japanese Jesuits, who had "the New Testament printed in the Japan language," although no copies of any such edition have survived.

The first complete Lapp translation of the New Testament appeared in 1755.

The coincidence of several factors at approximately the same time – an increased interest in using philology to restore the earliest recoverable form of a given text, the development of printing, and the desire on the part of Reformers from many denominations to make the bible available to the laity – led to an explosion of editions and translations of the Hebrew and Christian Scriptures during the Renaissance and beyond. This affected not merely religious life, but also politics and even hermeneutical methods in the natural sciences.

Birgivi, Mehmed Efendi

Born: Balıkesir, 1523

Died: Istanbul, 1573

Marinos Sariyannis

Institute for Mediterranean Studies/FORTH
(Foundation for Research and Technology –
Hellas), Rethymno, Greece

Abstract

Birgivi, Takıyüddin Mehmed Efendi (Balıkesir 1523–Istanbul 1573), was an influential Ottoman scholar and judge, who opposed the political ideas prevalent in his era by upholding old Islamic practice and advocating the abolishment of innovation; his ideas had an enormous influence throughout the seventeenth century.

Biography

Born into a family of scholars and Sufis in the provincial town of Balıkesir, Birgivi was the son of a prominent Sufi and teacher of the town, who initially taught him Arabic, logic, and other sciences. Later he moved to Istanbul to continue his studies under prominent scholars of the time. He became a teacher in his turn, a preacher in mosques and even an army judge in Edirne (1551), before leaving for Birgi (probably in 1571), a small but historical town near Izmir, where he became a professor at a newly founded *hadith* school until the end of his life. It was in Birgi that he wrote his highly influential works, among which the most important were the *Vasiyyetnâme* (*Testament*; also known as *Risâle-i Birgivi*, “Birgivi’s Treatise”), a catechism in Turkish; and its more scholarly counterpart in Arabic, *al-Ṭarīqa al-Muḥammadiyya wa al-sīrat al-Aḥmadiyya* (*The Muhammadan Way and the Character of the Most Laudable [Prophet]*), a detailed Hanafi-Maturidi exposition of the Sunna or Orthodox Muslim practice; his voluminous work also includes a body of essays dealing with legal issues, among which *al-Sayf al-sārīm fī*

‘adam jawâz waqf al-manqûl wa-l-darâhim (*The Sharp Sword for the Illegitimacy of Endowing Moveable Goods and Money*) and *al-Awjibât al-hâsima li ‘urûq al-shibhât al-qâsima* (*Zealous Responses to the Roots of Divisive Doubts*) on the legitimacy of monetary charitable endowments (the cash-*waqf*), as well as treatises on Arabic grammar, hadith scholarship or moral advice.

Al-Ṭarīqa al-Muḥammadiyya is divided into three parts: on upholding the Sunna, i.e., orthodox Muslim practice; on avoiding innovation; and on the importance of moderation (*iqtişād*). Birgivi’s emphasis on moderation notwithstanding, a major focus of the treatise is to oppose innovations in Muslim practice. Although Birgivi admits that there are innovations which may be permitted or even recommended (e.g., the building of minarets), he considers innovation a major threat to religion. Most importantly, he attacks “the Sufis of our time” and their innovative ritual practices, such as dancing or music. It should be stressed, however, that he does not dismiss Sufism wholesale, having been himself a follower of the Bayramiyye fraternity for a while. Another focus of Birgivi’s *Ṭarīqa* is piety (*taqwā*), which, in his view, is achieved by avoiding actions objectionable and doing things commanded by the faith, always with sincere intention. He discusses the matter at length, together with the various categories of sins; in this context, he employs Aristotelian theories of the soul and its faculties as formulated by al-Ghazālī and Naṣir al-Dīn Tūṣī, in order to show how one could educate one’s soul to be pious and virtuous in everyday life. In his epistemology, Birgivi classifies sciences into those that every Muslim should study (such as jurisprudence, hadith science, or mathematics), those forbidden unless studied under certain conditions (namely astronomy and scholastic theology or *kelām*, permitted only in order to erase suspicions), and those considered good and pious (e.g., medicine).

Heritage and Rupture with the Tradition

Birgivi lived in an era, in which Ottoman legal thought was dominated by Ebüssu‘ūd Efendi

(d. 1574), the *şeyhülislam* or chief *müfti*, i.e., the head of the religious hierarchy who gave definitive responsa (*fetva*) on questions regarding the Holy Law under Süleyman the Magnificent and his successors (from 1545 until his death). Ebüssü'üd had sought to reconcile the religious law (*şeri'at*), regulated by the *fiqh* or Islamic jurisprudence, with the codes of law (*kānūn*) issued by the Ottoman Sultans. In doing so, Ebüssü'üd devised *şeri'at*-based stratagems and legal precepts in order to justify various aspects of *kānūn* contravening previous Islamic law.

Opposition to such endeavors had already been manifest before Ebüssü'üd's appointment as *şeyhülislam*, mainly by his predecessor Çivizade Efendi. But it was Birgivi who opposed these policies in a most systematic and coherent fashion and exerted a profound influence on Ottoman politics for the century to come. Birgivi devoted the last chapter of his *Tariqa* to the fiscal and land regulations arranged by Ebüssü'üd. His numerous legal essays and a more political treatise, *Zuhr al-mulūk*, deal with several of Ebüssü'üd's "innovations." One may say that Birgivi's "usual suspect" was money: the pernicious nature of wealth is omnipresent in his criticism and underlies his rejection of various practices of his day. Thus, he negated the legitimacy of remuneration for religious services, e.g., the recitation of the Quran (although he admitted that gifts or donations may be permissible); he also was adamant in dismissing cash-*waqfs*, based on arguments such as the inevitable covetousness of *waqf*-administrators and the disruption of the normal course of inheritance, but primarily the fact that capital in cash could produce profit (to be used for charitable aims through pious foundations) only by usury, i.e., an evil practice that was strictly forbidden by Islam. The cash-*waqf* controversy was an issue for heated debate at the time. Birgivi attacked other aspects of contemporary practice as well, showing that his target was Ebüssü'üd's sanctification of *kānūn* and custom in general. Thus, he also opposed land-holding practice and, more precisely, Ebüssü'üd's assertion of state ownership over arable land and respective reconfiguration of the relevant terminology and taxation. Birgivi considered the land

tax illegal and stressed the injustice caused by it to the heirs of the peasant. Although he had to concede that state ownership was necessary in the Ottoman case, he opposed the systems established for taxation and for the transfer of land through inheritance of usufruct rather than possession.

Innovative and Original Aspects

In general, Birgivi's argumentation involved a strict interpretation of the sources of Islamic law. On the contrary, his opponents' (Ebüssü'üd and other fellow jurists) arguments were mostly based on legitimization by constant usage and on the welfare of the community, although their reasoning aligned with the principles and methods of Hanafi jurisprudence. Modern scholarship has traditionally associated Birgivi with Ibn Taymīyah's (d. 1328) Salafist views. Still, not only it seems that Birgivi never used Ibn Taymīyah (this image is mainly due to the latter's influence on Ahmed al-Rumī al-Akhisarī (d. 1632), whose works were misattributed to Birgivi), but it was exactly scholars favoring Ebüssü'üd (such as the jurist Dede Cöngi) who, in this era, were using Ibn Taymīyah's ideas on the secular authorities' role in juristic and administrative practice. Birgivi's influences are rather to be sought in his predecessors in the Ottoman anti-imperial opposition (such as Prince Korkud, d. 1513, or Çivizade, d. 1547). In this, he was following a trend in Hanafi thought emphasizing strict application of the *fiqh* principles, which was exemplified, for instance, by Ala al-dīn al-Bukharī (d. 1438). Furthermore, the aversion Birgivi exhibits toward the corruption of his time and the corrosive power of money exhibits affinities with the prevalent intellectual climate of the second half of the sixteenth century, as evidenced by the political treatises composed at the time.

A general assessment of Birgivi's work would also have to take into account his emphasis on practical issues; his treatises clearly had a didactic character, aiming to instruct the reader on leading a pious everyday life regardless the moral pathology of the times. Still, he effectively combined an

individualist approach (with his emphasis on the ethics of the soul) with a social aspect, focusing in the role of the state in encouraging or discouraging evil practices. Reform of self was for Birgivi essential, but so was reform of society.

Impact and Legacy

Birgivi's major works enjoyed a broad circulation and influence: his *Vâsiyet-nâme* was extremely popular and became one of the most consulted books on Sunni catechism (*ilm-i hal*). *Al-Ṭarīqa al-Muḥammadiyya* became a reference text in the heated controversies associated with the Kadızadeli revivalist movement throughout the seventeenth century. Birgivi wrote on the old Islamic obligation for "commanding right and forbidding wrong" (*emr-i ma'rûf ve nehy-i müinker*), i.e., the obligation of a believer to impose righteous behavior and to act against impious practices. To be sure, he was not the first to bring it in Ottoman thought and he still considered its active practice a prerogative of the state. It was some of the revivalist thinkers influenced by him, such as al-Akhisari (d. 1632), who theorized that every Muslim was entitled to practice this obligation even by force. Indeed, acting in an environment of growing militant conservatism where Birgivi's works were widely read, the preacher Kadızade Mehmed b. Mustafa (d. 1635) turned Birgivi's teachings to an activist movement, the Kadızadelis (meaning Kadızade's followers), which dominated the Ottoman political and ideological scene for the century to come. The use of Birgivi's work by Kadızadeli preachers was explicit (the initial denomination of the latter was "Birgivi followers," and a major attack against the Kadızadelis in the early 1650s was based on a refutation of Birgivi's *Ṭarīqa al-Muḥammadiyya* by two jurists, who claimed that the book was founded on weak traditions), although some issues raised by him (most tellingly, the rejection of cash-*waqfs*) were neglected while new ones were brought to the scene.

Thus, Birgivi has traditionally been considered the founding father of Ottoman Salafism and, by extension, of nineteenth-century Wahhabism as

well. Recent scholarship has emphasized that Birgivi's thought was more complex and multifaceted than mere bigotry and conservatism. Although he is often cited for his allegedly anti-Sufi views, Birgivi favored a type of Sufism based on pietism, rationalism, and a scriptural interpretation of the law that has led some scholars to associate him with the eighteenth-century "Neo-Sufism" or "Islamic enlightenment" (which, however, remains a controversial concept). Furthermore, his catechistic literature played a major role in what has been termed as the Ottoman "confessionalization" or "Sunnitization." The impact of Birgivi's thought on late sixteenth- and, especially, seventeenth-century Ottoman social and intellectual life was pervasive and had important political repercussions.

Biringuccio, Vannoccio

Born: Siena 1480

Died: Rome 1539?

Andrea Bernardoni

Institute and Museum of the History of Science,
Museo Galileo, Florence, Italy

Abstract

Italian metallurgist and military engineer, chiefly known as the author of *De la pirotechnia* (first edition Venice, 1540), a comprehensive work dedicated to the “Arts on fire” used in chemical-metallurgical processes and casting bronze production, especially artillery and bells, with a section dedicated to the production of gun-powder, fireworks, and its components. Biringuccio gives an analytical description of minerals and metals based on classical sources and his professional experience, discussing traditional theories of metals generation and contrasting the obscure alchemical position based on not empirically confirmed substances transformation processes. Thanks also to the clear practical instruction for metalworking *De la pirotechnia* became a standard reference and remains valuable as one of the most important source for artisans and technological process during the fifteenth and sixteenth centuries.

Biography

There are no documents concerning Biringuccio's school education, but he probably first attended an “abaco school,” and subsequently acquired mining skills in the area of Siena where he met key figures from artistic and engineering circles such as Baldassare Peruzzi (1439–1501) and Baldassare Peruzzi (1481–1536). He then managed the Monte Avanza silver mine in Carnia for a few years until he was forced to abandon it due to the war between Emperor Maximilian VIII and the Republic of Venice in 1508. On this occasion

he visited several mining areas in Northern Italy and Switzerland

He was professionally tied to the Petrucci family for a long time, and they shared the tumultuous political and military events that involved Siena in the first three decades of the sixteenth century. Biringuccio was banned from the city three times, and all his possessions were confiscated.

In 1529, he served the Florentine Republic as a *procurator* of artillery during the siege of the imperial army. When the political situation normalized, Biringuccio returned to Siena and took office in the public magistrature. In 1535, he succeeded Baldassare Peruzzi as the “architect and chief of the Opera del Duomo.” His fame as a foundryman and gunner grew as he spent time at important arsenals such as those of Venice and Ferrara. This led to the conferral by Pope Paul III of the double assignment of head of the papal foundry and captain of artillery of the pontifical army. The positions were bestowed upon him in 1534, and he held them until his death in Rome, presumably in 1539.

Heritage and Rupture with the Tradition

Biringuccio is known essentially for the posthumous publication of *De la Pirotechnia*, a treatise on mining, metallurgy, the military, and more generally dedicated to all chemical arts based on thermoregulation treatments. With the intention of clarifying and defining the domain of the fire arts, and distancing himself from alchemy, Biringuccio outlined new discipline boundaries identifying them for the first time in Italian, and using the term *pyrotechnia*. He did not merely provide a detailed description of processes and machines for metalworking but promoted an epistemological renewal counter to the medieval hierarchies. Inside the artisan cultural context embodied during the second half of the fifteenth century, in which the several aspects of engineering knowledge were always more autonomous, Biringuccio strongly promoted an idea of knowledge based on empirical evidence seeing natural processes as something which could be understood gradually through technological progress.

He developed an interesting corpuscular conception of matter that integrated his observations from professional experience with the principles of atomistic tradition and Aristotelian theory, derived principally from classical authors such as Albertus Magnus (d. 1280), Plinius the Older (23–79), and Aristotle (384–322 a.C.). Natural substances were seen as the result of aggregation according to various proportions of the four elements conceived in corpuscular form, which participated in the constitution of the substances and their transformation by carrying their qualitative specificities.

Metallurgical technology and foundry engineering were Biringuccio's main specialization. He presented a very detailed analysis of pedestrian and hydraulic bellows machines for casting, with the latter conceived to be integrated in multiple workstations with a centralized hydraulic motor. Very important are metal separation techniques, among which is the first description of the silver mercury amalgamation method and cupellation on an industrial scale. Biringuccio's analytical approach to these processes also led him to observe for the first time that leaded calcination increased its weight. Many pages of *De la pirotechnia* are dedicated to distillation apparatus, especially for the preparation of acids.

Bronze casting techniques for sculptures, bells, and artillery are detailed, giving the first clear description of direct and indirect molding processes. With regards to engineering, much space is dedicated to drawing benches, one of which is powered by a hydraulic wheel for the continuous production of iron wire. Particularly important is also the analytical description of the horizontal boring machines for artillery. The last chapter is entirely devoted to the production of gunpowder and pyrotechnic preparations in general.

Biringuccio's *Pyrotechnia* was published in four Italian and two French editions before the end of the sixteenth century. There is also a reference to a lost Latin edition that would have been made in Cologne in 1658. Important parts of Biringuccio's book were borrowed in the treatises of naturalists and military engineers from the seventeenth and eighteenth centuries. The *Pyrotechnia* is traditionally associated with *De re metallica* by

the German physician and naturalist Georg Bauer, Latinized Agricola which, thanks to the Italian translation of 1563, took away a great deal of visibility from Biringuccio's book. However, the more engineering and broader thematic horizons of *De la pirotechnia* made it an important reference for craftsmen, engineers, and naturalists for a long time. A new edition was published in 1678.

Blackloism

Han Thomas Adriaenssen
Faculty of Philosophy, University of Groningen,
Groningen, The Netherlands

Abstract

The Blackloists were a group of English Catholics aiming to secure toleration for Catholicism in Protestant England. They were critical of what they saw as the sceptical tendencies of

early modern philosophers. Admirers of Aristotle's philosophy, some of the Blackloists believed that Aristotelianism could go hand in hand with the new mechanical philosophy.

Political and Philosophical Programme

Blackloism was a school of thought in seventeenth-century English Catholicism, owing its name to Blacklo, an alias of its leading figure, the English priest and philosopher Thomas White. Among its members were such men as Henry Holden, Kenelm Digby, and John Sergeant. Politically, the Blackloists aimed at securing toleration for Catholics in Protestant England. In exchange for toleration, they promised that leaders of the Catholic Church in England would renounce all worldly powers, and among other things proposed the installation of bishops who would operate independently from the Pope. After the execution of Charles I in 1649, Digby actively negotiated with Cromwell for toleration, and in 1655, White published his *Grounds of Obedience*, in which he effectively advised his fellow-Catholics to support the Cromwellian regime (see also Southgate 1993, 34–41).

The political aim of securing toleration for Catholics went hand in hand with a theological programme, which sought to bring Catholicism closer to English Protestantism. Thus although the tradition of the Church provided the rule of faith, the Blackloists denied papal infallibility, and they rejected those aspects of the doctrine of purgatory which had been most objectionable to the Protestants. Thus in his *De Medio animarum statu* of 1653, White criticized the idea that the living could do anything to alleviate the suffering of souls that are being purged from their sins, thereby denying that it was in the church's power to grant indulgencies (see Henry 1982, 227).

In spite of these concessions, the Blackloists remained critical of the Protestants' idea that the Bible could function as a rule of faith. The text and meaning of the scriptures were too uncertain to provide certainty in religious matters. To claim that we could be "morally certain," or certain

beyond a reasonable doubt about the scriptural texts and their meaning, as, for example, William Chillingworth had done, was to open the doors to scepticism. In White and Sergeant, this claim went hand in hand with a general quest for certainty. Thus White's 1663 *Scire, sive Sceptices et Scepticorum a jure Disputationis Exclusio* charged Joseph Glanvill with scepticism for arguing that absolute certainty is not humanly attainable, and the aim of Sergeant's 1697 *Solid Philosophy* was to beat down the scepticism that he believed to be inlaid in the philosophy of ideas of Descartes and Locke.

Although in philosophy the most important among the Blackloists shared a broadly Aristotelian outlook, they also believed that scholasticism had perverted Aristotle's true meaning. In particular, they criticized the scholastics for inferring from our capacity to think of accidents independently of their substance that accidents have an ontological status of their own over and above that of the substances in which they exist (Digby 1644, 2). For Digby, accidents were but modifications of the substances to which they belong, and White too argued that "it implies a contradiction that any Accident should exist out of its own Subject," even if theologians may have claimed otherwise to account for transubstantiation (White 1656, 196).

By purging it from real accidents and other scholastic accretions, Digby and Sergeant hoped to bring Aristotelianism in harmony again with common sense or with the "common notions" with which all men by nature grow up to understand the world. According to Digby and White, moreover, a modernized Aristotelianism could go hand in hand with the new mechanistic philosophy. Although, metaphysically, bodies were compounds of matter and form, in physics we should aim for mechanistic explanations of their operations (Digby 1644, 345).

UCLA, Los Angeles, CA, USA

Abstract

Thomas Blundeville (c. 1522–c. 1606) was an English humanist writer and mathematician who supported a policy of maritime expansion. He wrote practical manuals on navigation, cartographic projection, arithmetic, and astronomy, as well as learned treatises on logic, history, education, and horsemanship. Many of his earlier works were based on Italian originals.

Biography

A prominent English humanist who, in the span of a four-decade career, published works on a broad range of topics. In his early years, he focused on traditional humanist topics, including moral philosophy and advice to princes. Then, after a

15-year hiatus, he published three works with a very different emphasis, intended as practical handbooks for mapmakers and navigators. The most influential of these was a popular technical guide entitled *M. Blundeville, His Exercises*, first published in 1594.

A member of the Norfolk gentry, Blundeville inherited his father's estate of Newton Hall in 1568 but seems to have spent much of his life in court circles in London. Educated at Cambridge, by the 1560s and 1570s, he was a member of the humanist entourage of Queen Elizabeth's favorite, Robert Dudley, Earl of Leicester (Ball and Rouse 1889, p. 21; Dick 1940, p. 153). By the 1590s, following the earl's death, Blundeville was associated with Francis Wyndham, judge and MP from his native Norfolk; Sir Nicholas Bacon, Lord Keeper of the Seal; and, through him possibly with his son, Sir Francis Bacon (Jacquot 1953, p. 195). At some point in the early part of his career, Blundeville likely traveled in Italy, where he learned the language and became familiar with local humanist scholarship (Dick 1940, p. 154).

Blundeville's early works were very much in the continental humanist tradition, including translations from classical sources and an emphasis on practical advice over high philosophy. In 1561 he published *Three Moral Treatises*, which was a translation of segments of Plutarch's *Moralia*. He followed this 5 years later with *The fower chiefyst offices belonging to Horsmanshippe*, an adaptation of an Italian work by Federico Grisone, which emphasized the military use of horses. In 1570 he published a translation from Italian of a book of advice to "a prince that will governe well" that was originally written by Federigo Furio in Spanish, as well as an advice book called "A Ritche Storehouse or Treasure for Nobilitye and gentlemen" translated from Latin (Bullen 1886). A book on *The Arte of Logike*, though published only in 1599, also dates from this period. Following Erasmus and most continental humanists, Blundeville, throughout these works, recommended virtue as both the right and most effective path for a ruler to follow (Jacquot 1953, p. 190).

In 1574 Blundeville published what may have been the first work in English on the theory of

history entitled *The True Order and Methode of Wryting and Reading Hystories*. Once again the book is largely a translation of two Italian treatises: One *Della historia diece dialoghi* by the leading Platonist Francesco Patrizzi; The other was an unpublished work known as *Delle osservationi* by Giacomo Concio, an Italian expatriate and, like Blundeville, a member of Leicester's circle. Following his sources, Blundeville advocates for a broad view of history, which is not limited to the deeds of great and good men of the past, but also recounts the stories of the world, of empires, of individuals, and even of the present. In writing such works, one should take into account not only men's actions but also for their motives, which may be deduced from their character, their upbringing, their education, and so on. Such histories, Blundeville insisted, would be of immense practical value to men of affairs, who can use them to experience the great events of the past and learn from them (Dick 1940).

We do not know the reasons for Blundeville's silence in the next 15 years, but when he resumed publishing, his work had a distinctly different cast. As a longtime protégé of the Earl of Leicester, he was already associated with the court faction that viewed Queen Elizabeth as the leader of the Protestant cause and advocated for an aggressive anti-Spanish stance. Now, however, he focused on directly implementing this general attitude by providing practical support to English maritime expansion (Taylor 1954).

Blundeville's first work in this vein was *A Briefe Description of Universal Mappes and Cardes*, which was published 1 year after the defeat of the Spanish Armada, when enthusiasm in England for all things naval ran high. He followed this 5 years later with his *Exercises*, which was likely his most widely read and influential work. The *Exercises* is a collection of six treatises on topics ranging from elementary arithmetic to the geometry of the sphere, geography, and cartographic projection. Despite the diversity of topics, however, the overall purpose of the work is never in doubt. It is, as he states on the title page, to be "read and learned by all young gentlemen" who desire to learn "the Arte of Navigation." The *Exercises*, in other words, is a

practical handbook for use by leaders of maritime expeditions.

The *Exercises* was notable for its comprehensiveness and its clear and accessible style, which made it indeed a useful textbook for navigators. But it also contained a novel and important contribution naval cartography: Edward Wright's tables of meridional parts. The problem for navigators is that a ship sailing at a fixed direction creates a complex spiral on the surface of the Earth, called a "rhumb." The challenge is to produce a map which would show mariners where they would make landfall if they sail in a fixed direction. Gerard Mercator (1512–1594) apparently solved the problem with what became known as the "Mercator projection" but did not explain his method. The first to do so was Blundeville's fellow Englishman, also from Norfolk, the cartographer and voyager, Edward Wright (1561–1615), who produced tables showing how to gradually increase the distance between latitude lines in order to preserve true directions. These tables, critical for the production of large-scale naval maps, were first published in Blundeville's *Exercises* (Alexander 2002, pp. 60–61; Ball and Rouse 1889, p. 22).

Blundeville followed the *Exercises* with *The Theoriques of the Seven Planets*, a book on astronomy that closely follows Georg von Peurbach's (1423–1461) *Theoricae novae planetarum*, adhering to a traditional geocentric view of the cosmos. To reinforce the practical uses of astronomy for mariners, Blundeville once again included novel navigational tables, produced by Henry Briggs in accordance with theories developed by William Gilbert (1544–1603) in *De Magnete* (1600). Gilbert argued that the precise dip of a magnetized needle was an indication of geographic latitude, thereby freeing sailors from reliance on astronomical observations that are often impractical. Briggs calculated the required tables, and Blundeville published them in *The Theoriques*, believing them to be a groundbreaking contribution to the art of navigation. As it happened Gilbert's theory was soon discredited, and *The Theoriques*, unlike the *Exercises*, proved to be of little practical use to mariners (Jacquot 1953; Sonar 2006).

Blundeville, who in all his books relied heavily on the works of others, was hardly an original author, yet the overall tenor of his opus is distinctly modern. He was a firm believer in the advancement of knowledge and did his best to encourage and disseminate the latest works – whether humanist or mathematical – that could advance the cause of his countrymen. He did so because he never doubted what his contemporary Francis Bacon reputedly stated: knowledge is power.

Boccaccio, Giovanni

Born: June or July 1313, Certaldo or Florence

Died: 21 Dec. 1375, Certaldo

Igor Candido

Trinity College Dublin, Dublin, Ireland

Abstract

Boccaccio is one of the greatest writers of the Western literary tradition and among the most prolific authors of Italian literature. Today he is

renowned for his narrative masterwork, the *Decameron*, a collection of 100 tales which aims to portray the late medieval/early modern world in a realistic manner. Boccaccio's narrative style is a milestone on the way to the creation of Western realism. His model brought about the Italian novelistic genre which would thrive until the end of the seventeenth century. Boccaccio also wrote romances in narrative poetry and prose, lyric poetry, letters, vernacular biographies (viz., of Dante and Petrarch), a commentary on Dante's *Inferno* (cantos 1–17), Latin poems, biographies and treatises, among which the *Genealogy of the Pagan Gods*, a 15 book encyclopedia on classical myths. Here he claims as his own achievement the reconstructed unity of the Ancient Greek and Latin world in his age. Though his culture remained essentially Latin and vernacular, he was indeed the first to value Greek culture as more important than Latin, so that he fostered the return of the Greek language to the West by promoting the first Latin translation of Homer's *Iliad* and *Odyssey* as well as the first chair of Greek at the Florentine University. Geoffrey Chaucer read and imitated Boccaccio's epic romances as well as, most likely, some of his Decameronian tales. In the Cinquecento Pietro Bembo singled out Boccaccio's prose writing as the best model of style for any works composed in the Italian vernacular.

Biography

Giovanni Boccaccio was born in Florence or Certaldo. Offspring of an illicit love, he was legitimized by his father Boccaccino di Chelino, an influential Florentine businessman who reached the high magistracy of the priors. At the school of Giovanni di Domenico Mazzuoli da Strada, father of Zanobi, Giovanni learned the elementary rules of Latin grammar and was probably introduced to Ovid's texts, commonly used for teaching, but also to those of Dante Alighieri. When he was around 11 years old, the father decided that his son should be trained in commerce in order to

become his business partner (*Gen.* 15.10). During this mercantile apprenticeship, most likely in 1327, Giovanni moved to Naples with his father, who had developed economic relations with the Angevin court. In Naples, Boccaccio experienced the refinement of courtly society, idealized in the famous "love questions" of *The Filocolo* (Book 4), but more importantly, he had access to the rich cultural environment fostered by Robert of Anjou. He also studied canon law and might have been in touch with Cino da Pistoia, who lectured at the Neapolitan Studio in 1330–1331. Whether it was Cino who introduced the young Boccaccio to Dante's poetry is still debated. Undoubtedly, the encounters with Paolo da Perugia and Barlaam of Calabria helped shape Boccaccio's interest in ancient mythology and the Greek language, respectively, while Andalò dal Negro, whom he valued as a mentor, introduced him to the astrological sciences.

Belonging to the Neapolitan period are the *Caccia di Diana*, a narrative poem in tercets (1334?), the classical romances *Filostrato* (1335 or 1339?) and *Teseida* (1340–1341) in octaves, and a prose romance, the *Filocolo* (1336–1338). The *Filostrato* is inspired by the Trojan cycle and narrates the tragic love of Priam's son Troilus for Criseida, Calchas' daughter, whose return to the Greek camp and new love for Diomedes lead Troilus to seek death in a mortal duel with Achilles. Portrayed as a love suicide, Troilus' death aims to teach young lovers to act "so wisely that ye shall not die in the end for an evil woman" (*Fil.* 8.33.7–8: tr. Griffin and Myrick). Drawing on different sources, among which Benoît de Sainte-Maure's *Roman de Troie* and its Latin translation, the *Historia destructionis Troiae* by Guido delle Colonne, the *Filostrato* inspired Geoffrey Chaucer's *Troilus and Criseyde*. Boccaccio's attempt to revive the classical world is aptly reflected in the *Filocolo*, which merges the narrative structure of the ancient novel with the famous Byzantine legend of the adventures of two lovers, Florio and Biancifiore, as it was later reworked in French and Italian vernaculars. In this way, the new prose romance aims to find its own middle path through the great classical epics of Virgil, Ovid, Statius, Lucan, as well as Dante's opus,

finding inspiration within them but never daring to challenge them. It is with the *Teseida* that Boccaccio attempts to found the epic genre in the Italian literary tradition, whose absence was lamented in Dante's *De vulgari eloquentia* (2.2.10). The plot centers on two old friends, Arcita and Palemone, who must combat one another for the beautiful Emilia in a grandiose tournament. Arcita is victorious but dies shortly after from his battle wounds, while Palemone finally obtains the lady's hand. Boccaccio's statement that this ancient tale had never been translated from Greek into Latin has been interpreted as an allusion to the fact that he had knowledge of the Byzantine source, like Statius and the author of the *Roman de Thèbes*. The text of the *Teseida* is enriched by a number of mythological explanatory glosses, probably written in Florence, which in many respects anticipate the erudite works Boccaccio was to write in the second part of his life.

Sometime in the winter of 1340–1341, Boccaccio left Naples and returned to Florence. After a difficult beginning marked by longing for his Neapolitan life, he finally immersed himself in Florentine culture, which inspired the *Comedia delle ninfe fiorentine* (1341–1342) and the *Amorosa visione* (1342). The pastoral framework of the *Comedia*, which narrates the transformation of Ametus from a rough shepherd into a tender and noble lover, anticipates one of the most important themes of the *Decameron* as exemplified in the tale of Cimone (5.1). In the *Amorosa visione*, a poem in 50 cantos in Dantean tercets, the poet sees in a dream a succession of triumphs which culminates in that of virtue, a pattern which will later influence Petrarch's *Trionfi*. In the *Elegia di Madonna Fiammetta*, written some time in 1343 or 1344, Boccaccio turns the Ovidian epistolary model of the abandoned woman writing to her far lover into a long monologue, intertwined with quotations from Seneca, Ovid, and Dante, which Francesco De Sanctis defined as the first psychological novel. The work has no action and its narrative motor is the introspection of Fiammetta, the first person narrator, who progressively realizes that her beloved Panfilo will not return to her. In the following years (1344–1346?), Boccaccio composed the *Ninfale*

Fiesolano, an etiological fable in 487 octaves which recounts the love of the shepherd Africo for the nymph Mensola and the birth of their son Pruneo, whose deeds are connected to the founding of Florence and Fiesole.

No earlier than the end of 1345, Boccaccio spent time in Ravenna (see Petrarch's *Fam.* 12.19), where there resided another important family by the name of Boccaccio, possibly related to that of Certaldo, and where Florentine culture, mainly due to Dante's final sojourn, was much appreciated. Between the end of 1347 and the beginning of 1348, Boccaccio was at the court of Francesco Ordelauffi in Forlì, another of Dante's cities. Here he continued to collect Dantean texts and memoirs which he transcribed in his notebook, the *Zibaldone Laurenziano*. Boccaccio's cultural experiences in Romagna and, namely, his closeness to Checco di Meleto's humanistic circle, together with the reading of Dante's Latin eclogues, most likely played a role in his return to Latin poetry, which would lead to the composition of the *Buccolicum carmen* around 1366.

Boccaccio was certainly in Florence in March–April of 1348, when the Black Death decimated the town's population. It is possible that, in the aftermath of this tragic situation, he set out to compose the *Decameron* some time between 1348 and 1351 (Branca 1976: 77); the work was certainly circulating before 1360, as we learn from Francesco Buondelmonti's letter to Giovanni Acciaiuoli (Branca 1991, II: 163–164). In the story of seven young women and three young men, who withdraw to the hills of Fiesole in order to escape the plague and enjoy one another's company with song, dance, and storytelling, "Boccaccio depicted the 'human comedy' of communal society, in the autumn of its medieval civilization" (Branca 1976: 77).

In 1350, Boccaccio met Petrarch for the first time. After this encounter, which was certainly the most influential of his literary career, he established the poet laureate's pre-humanist circle that gathered together the most important representatives of Florentine culture in those years: Zanobi da Strada, Francesco Nelli, Lapo da Castiglione, and perhaps Francesco Bruni as well. Around 1350 Boccaccio also began to

collect and develop the material that would become the nucleus of his *Genealogia deorum gentilium*, a mythological treatise in 15 books which was completed about one decade later. In those same years, Boccaccio set out to compose other works, such as the *De casibus* (1355; second edition 1373–74) and the *De mulieribus claris* (begun in 1360 and completed in 1375), which, like the *Genealogia*, would be revised and reworked up to his death. The end of this decade saw Boccaccio occupied with the promotion of a translation of Homer entrusted to Leontius Pilatus, a Calabrian Greek, who was also invited to join the Florentine Studio as the first chair of ancient Greek in non-Byzantine Europe.

In 1361, Boccaccio withdrew to Certaldo in search of solitude and meditation. This withdrawal might also have been a voluntary exile, as he may have been aware of, or even involved in, the Florentine conspiracy in the beginning of that year (Filosa 2014). Here, some time around 1365, he set out to write his final work in the vernacular, a misogynous little pamphlet titled *Corbaccio*; this satire marks the conclusion of his philogynist literary project. Between the autumn of 1370 and the spring of 1371, Boccaccio was again in Naples, where a circle of his admirers used to gather to discuss his works; his frequent epistolary exchange with them was to bring consolation to the old man's retirement in Certaldo. Among these Neapolitan friends, the most discussed of Boccaccio's works was certainly the *Genealogia*. When the Certaldese finally granted some of them permission to read the treatise, Pietro Piccolo da Monteforte commissioned copies for himself and the library of the convent of San Domenico. From his copies originated the first manuscript tradition of the work; the second or "vulgate" dates back to the decade following Boccaccio's death (Solomon in: Boccaccio 2011: 775). In the same years, Boccaccio also revised the *Decameron*, creating what is today the work's only extant autograph copy, the Ms. Berlin, Hamilton 90. Another copy was received by Petrarch in Padua at the beginning of 1373, as we learn from one of Petrarch's letters in the *Seniles* which introduces his famous Latin

translation of the Griselda tale and forms, along with the following letter, a pre-humanistic treatise known as *De insigni obedientia et fide uxor* (*Seniles* 17.3–4).

In August 1373, the Florentine commune approved a petition which requested that Boccaccio read and explain publicly Dante's *Divine Comedy*. The first lecture took place on Sunday, October 23, in the church of Santo Stefano di Badia, close to the house of the Alighieri family; others followed until early in 1374 and ending with Canto 17 of the *Inferno*. His health in decline, Boccaccio divided his physical and intellectual energies between endless revisions of the *Genealogia* and the composition of the *Esposizioni sopra la Commedia* from his lecture notes and other various materials. Still at work, on December 21, 1375, the father of European narrative died in his house in Certaldo at the age of 62.

Heritage and Rupture with the Tradition

In his *History of Italian literature*, Francesco De Sanctis wrote that the *Decameron* is a revolution in which the Middle Ages is "not only denied, but made fun of," and that Boccaccio "is the Voltaire of the fourteenth century" (1870; trans.1968: 290). Boccaccio's masterwork finally gave a literary voice to the earthly, human realm, which the dominant paradigm of a transcendental and "theocratic" literature (from Guido Guinizzelli to Dante Alighieri) had completely concealed. This interpretation of Boccaccio as a forerunner of Italian Renaissance literature loomed large well beyond his century. Only in 1956 did Vittore Branca finally react to this interpretation by arguing for a *Decameron* deeply rooted in medieval culture. Here contemporary society is at the center of a narrative work for the first time; there are no heroes as in Homer or Virgil or the Bible, but instead a broad variety of characters from Boccaccio's own time. The *Decameron* opens with the description of the Black Death of 1348; what Hegel had defined as "the modern popular epic" – that is, the novel and its new narrative art – finds in this famous beginning its proper

dramatization. Boccaccio's work, according to Branca (1976 and 1980), can therefore be defined as "a human comedy" which portrays the rise of the new Italian mercantile bourgeoisie. Nevertheless, the scholar did acknowledge Boccaccio's pre-humanistic culture as it developed from the early 1350s under the direct influence of Petrarch, who finally managed to shift Boccaccio's inspiration from creative works in the vernacular to scholarly biographies and treatises written in Latin. From 1360 onward, Boccaccio's house was to become the true center of Italian pre-humanism, the place where Northern and Southern Petrarchisms could meet (Branca 1996: 277–97). In this transition from vernacular to Latin works, Bruni (1990) conjectured the existence of two cultures undergirding Boccaccio's writing; two cultures that developed into two successive – but sometimes overlapping – phases revolving around the *Decameron*, the final and most important moment of a long-lasting project devoted to his philogynist literary project. Flasch (1992) then criticized the interpretation of a medieval Boccaccio by pointing out that medieval Christian thought, in which both Boccaccio and Dante were immersed, is far too varied and nuanced to be reduced to Scholasticism alone. From a different perspective, Velli (1995) and Candido (2014) focused on Boccaccio's humanistic approach to ancient literature and his extensive use of Latin classical sources, with special reference to Seneca and Apuleius, respectively. More recently, through the analysis of his political thought, Hankins (2019) has maintained that Boccaccio is best categorized as a representative of Renaissance humanism. Lavagetto (2019) also offers a corrective to Branca's "medieval" Boccaccio, and in addition to a series of provocative readings of both the "frame" and *novelle* of the *Decameron*, he also argues for a serious reconsideration of Francesco De Sanctis's reading of the text on its own terms.

At the library of Montecassino, in fact, Boccaccio read texts that were fundamental to a historical understanding of the ancient world, and he acquired two manuscripts that would prove hugely important for Italian Renaissance thought: one bearing the fragments 5–24 of

Varro's *De lingua latina*, Cicero's *Pro Cluentio* (later copied and sent to Petrarch), and the *Rhetorica ad Herennium* (today Ms. Florence, Laur. 50, 10) and the other bearing Apuleius and Tacitus's *Annales* 11–16 and *Historiae* 1–5 (today Ms. Florence, Laur. 68.2; Branca 1976: 106). Boccaccio also had access to authors unknown to Petrarch, and he discovered, along with Varro and Tacitus, Lactantius Placidus (a commentator of Statius's *Thebaid*), Martial, Ausonius, Ovid's *Ibis*, Fulgentius's *Expositio sermonum antiquorum*, the *Carmina XII sapientium*, a few poems from the *Appendix virgiliana*, the full collection of eighty *Priapea*, and perhaps also Cicero's *Verrine Orations* (Sabbadini 1905: 33; Mazza 1966; Signorini 2011).

Like Petrarch, Boccaccio's relentless hunt for manuscripts of classical and Christian authors bears witness to his desire to revive ancient culture, both Greek and Latin, and to contaminate it with the Christian tradition. In 1355, for example, he shipped to Petrarch the complete volume of Augustine's *Enarrationes in Psalmos*, a precious gift whose cultural importance is acknowledged in Petrarch's *Fam.* 18.3 and on the manuscript's first folio (today Ms. Paris, lat. 1989). Examples of this happy blending of classical pagan and medieval Christian sources are the *Filocolo*, *Teseida*, and above all the praise of poetry in the *Trattatello*, or *Dante's Life*, and in *Gen.* 14.7. In both works, Boccaccio wants to defend poetry against its detractors who consider it useless, fantastical, pagan, and non-remunerative. Also, in the footsteps of his mentor Petrarch (*Fam.* 10.4), as well as Dante before him, he aims to elaborate a new definition of poetry as a sacred art, indeed a theology, with the poet as priest. In aesthetic terms, the concepts of *poeta theologus* and of theology as a divine poetry are still medieval, as both stress that the truth of poetry is allegorical, or to be found underneath the surface of poetic fiction. At the same time, these concepts also imply the terms of one of the most important humanistic debates, to be inaugurated by Giovanni Dominici's *Lucula Noctis* and Coluccio Salutati's defence of poetry in his *De laboribus Herculis* (Branca 1976: 277–99).

Innovative and Original Aspects

Boccaccio was one of the most prolific authors of Italian literature and a relentless experimenter with genres, many of which had never been attempted previously in the Italian vernacular. His natural inclination to continue experimentation singles him out as a unique voice in the fourteenth-century culture as well as in the subsequent literary canon that was to be established on the solid foundation of the intellectual experiences of the Trecento. Branca (1996) underlined “the genius of his surprising cultural agility” (p. 306), which allowed Boccaccio to introduce to Italy, and to Europe as a whole, genres such as the novel, the chivalric epic, the pastoral, the so-called psychological novel, the forest idyll, the modern form of the *Decameron*, the literary hagiography, the moralistic biography, and the mythography. Seen in this light, Boccaccio’s *oeuvre* in fact reveals a well-defined intellectual project, to provide the Italian literary tradition with all its missing genres, created anew or revived in continuity with classical and medieval models. At his death, this ideal map of new Italian literary genres had transformed into a canon of influential works.

It is still debated whether it was Boccaccio who created the octave and first used it in the *Filostrato* or whether his epic romance reveals the literary adoption of the scheme from the popular *cantare* genre. Boccaccio can certainly be considered the father of the novella in its standard form, which differs from similar genres such as the *vida*, *fabliau*, or *exemplum* (Neuschäfer 1983; Bruni 1990). Another key innovation was Boccaccio’s choice to gather his 100 tales within a frame story, also known as a *cornice*. The open format of the *Novellino* (ca 1280–1300), a loosely structured anthology of stories which is the *Decameron*’s only European antecedent, is transformed into a self-contained collection in which a meta-story encompasses all the others. This change adds layers of complexity to the narrative structure: narrators in fact comment on their own stories, their origins, and the reasons for choosing them, and they use storytelling as a means to build up a

dialogue with one another (Forni 1995: 1–2). Moreover, “the frame-story enclosing other stories is, historically, a bridge between anecdote and novel” (Wellek and Warren 1949: 230). Therefore, it is a suggestive hypothesis that the narrative structure of the ancient novel, known to Boccaccio through Apuleius’s *The Golden Ass* and the *History of Apollonius of Tyre*, may have inspired the new form of the *Decameron* (Candido 2016).

Among Boccaccio’s innovations is the newly addressed female readership from the early vernacular writings to the *Decameron*, so that this vernacular corpus has been aptly labelled as philogynist literature (Bruni 1990). In the footsteps of Ovid’s *Ars Amatoria*, Book 3, the Proem of the *Decameron* explicitly identifies women in love as the readership for which the work was written. Likewise, the *De Mulieribus Claris* would later be dedicated only to women, a subject group previously excluded from historiography. The *Decameron* therefore is meant to be for women, and laymen in general, a handbook of moral philosophy which will help moderate vehement passions and ultimately overcome depression potentially leading to suicide. The philosophical dimension of Boccaccio’s storytelling has been the focal point of scholarship from Flasch (1992). Andrei (2018) has investigated the philosophical aspects that concern knowledge, while Celenza (2019) has set Boccaccio’s approach to philosophy within the historical context of the pre-modern tradition that has been alive and thriving since antiquity. Earlier, Italo Calvino’s examination of *Dec.* 6.9 utilized a telling image that portrays Boccaccio’s subtle philosophy. In the novella, the natural philosopher Guido Cavalcanti, considered an “Epicurean” in the medieval sense of someone who wants to disprove the Platonic-Christian tenet of the immortality of the soul, gets rid of the annoying company of Betto Brunelleschi’s brigade with an obscure sentence, which turns out to be a veiled offense. Beyond this spirited reply, worth noting is Cavalcanti’s leap above the tombs to free himself, the gesture of the philosopher who raises himself above the weight of the world (Calvino 1988: 12).

Impact and Legacy

In *Gen.* 15.7 Boccaccio claims to have been the first who fostered the return of the ancient Greek language to Florence and to the West, by making possible the appointment of Leontius Pilatus to the chair of Greek at the Florentine University (1360–1362), as well as by promoting the first Latin translation of Homer's *Iliad* and *Odyssey* made by Leontius himself. Though Boccaccio's culture remained essentially Latin and vernacular, this statement of his cannot be underestimated as he indeed was the first to value Greek culture as more important than Latin; in his view, in fact, a true humanist had to be familiar with and rely on Greek culture, itself the matrix of Latin culture. Also, in Boccaccio, considerably more than in Petrarch, once again at work is the fusion between Latin and Greek cultures, which from the end of the sixth century to the second half of the fourteenth century had been kept separate (Osgood 1956: xxvii; Pertusi 1964: 380).

Boccaccio was also the initiator of the cult of Dante. His first celebration of the author of the *Divine Comedy* can be found in the imaginary coronation described in the *Amorosa visione* (5.84–88), a visionary poem written in Dante's own meter, the tercet. Widely circulated was Boccaccio's *Trattatello* (earliest redaction in 1352), the first biography of Dante and the most important, together with that by Leonardo Bruni (circa 1436). But the major achievement of Boccaccio's interest in Dante was the commentary on the *Inferno* which was interrupted at the first lines of Canto 17 due to Boccaccio's final illness and subsequent death. This commentary was developed from notes written for about 60 readings from the poem that Boccaccio made in the Florentine Church of Santa Badia from 23 October 1373 to January 1374. The literal reading of the poem, meant to offer a moral lesson to his listeners, is here juxtaposed with a less elaborate allegorical interpretation, aimed at instructing more erudite readers (Houston 2010: 140).

If the influence of the *Decameron* on Chaucer's *Canterbury Tales* is still under debate, it cannot be called into question that the English poet, who had

a very good knowledge of Italian, did draw on Boccaccio's early works, the *Filocolo*, *Filostrato*, and *Teseida*. Although he never mentions Boccaccio, the fourth book of the *Filocolo*, and possibly *Dec.* 10.5 that is a retelling of the same story, offered a model for *The Franklin's Tale*, the general plots of the *Teseida* and the *Filostrato* for the *Knight's Tale* and *Troilus and Criseyde*, respectively. Wallace (1985) has shown how Chaucer borrowed more from Boccaccio than from any other writer; for example, almost every stanza of the *Filostrato* offered several motifs for elaboration, which are freely utilized in the *Troilus*. Chaucer's favored method was to reduce the original text by means of paraphrase or translation and then expand it in an original way. While Petrarch's Latin translation of the Griselda tale is the primary source of the *Clerk's Tale*, together with a French translation known as *Le livre Griseldis*, for Kirkpatrick (1983) and others, it is unlikely that Chaucer also relied on Boccaccio's original story; for Thompson (1996), Hanning (2000), Edwards (2002), and Harkins (2013), it was, on the contrary, a distinct possibility. Biggs (2017) has then linked the origins of the *Canterbury Tales* to the *Decameron* by identifying Chaucer's debt to Boccaccio's writing techniques.

In Renaissance Europe, the *Decameron* enjoyed wide circulation both before and after the Church placed it on the Index of Forbidden Books in 1557 and renewed the condemnation at the Council of Trent in 1563. Italian humanists followed Petrarch's example by translating Boccaccio's tales into Latin: *Dec.* 1.1 (Antonio Loschi), 4.1 (Leonardo Bruni), 10.1 (Bartolomeo Fazio), and 10.8 (Filippo Beroaldo and Matteo Bandello). Likewise, the *Decameron* provided the inspiration for the popular genre of the *cantare*: written between the early fifteenth and late sixteenth century, a corpus of 18 adaptations of Boccaccio's tales circulated in print; another 5 have been passed down by the manuscript tradition alone (Rada 2009: 17). It was in the first decades after the advent of the printing press that the *Decameron* enjoyed its greatest fortune in terms of both new editions and illustrations of the text (Branca 1996: 355). Thanks to Lorenzo

de' Medici, Poliziano, and later Pietro Bembo, Renaissance painters such as Francesco Pesellino, Botticelli, Luca Signorelli, Bernardino Luini, Cima da Conegliano, Francesco di Ubertino, Vittore Carpaccio, and Bonifacio Veronese, among many others, found congenial inspiration in Boccaccio's tales (Branca 1999, 1: 33–34). In his influential *Prose della volgar lingua* (1525), Bembo elaborated a theory of imitation which proposed the literary language of Petrarch and Boccaccio as the best models in the Italian vernacular for writing poetry and prose, respectively. In France, after the first translation appeared in 1414, Queen Marguerite de Navarre commissioned a new version of the *Decameron*, produced by Antoine Maçon and published in 1545, which was to provide inspiration for the *Heptaméron*, a framed collection of stories, attributed to Marguerite herself. Relying on Maçon's translation, William Painter translated into English 16 tales from the *Decameron* in his *Palace of Pleasures* (1566), one of which (*Dec.* 3.9) lent the plot for Shakespeare's *All's Well That Ends Well* (Wallace 1991: 110). The Spanish *Siglo de Oro*, with its picaresque novels, comedias, and Cervantes's *Don Quixote*, was also heavily indebted to Boccaccio's art of storytelling (Bayliss 2000).

The first English translation of the *Decameron* only appeared in 1620, more than two centuries after Chaucer's *Canterbury Tales*. By the sixteenth century, English writers had turned from the example of Chaucer to that of Boccaccio, whose rediscovery was to inspire modern authors such as John Dryden, John Keats, George Eliot, and James Payn (Wallace 1991: 111–12). In the twentieth-century Ireland, Brendan Kennelly's *The Florentines* draws a parallel between the English youth of 1960s protesting against the threat of nuclear war and the *Decameron*'s Florentine brigade escaping from the plague of 1348 (Bendelli 2012: xi). Two cinematic adaptations should be mentioned: Pasolini's *Decameron* (1971), the first chapter of his *Trilogy of Life* which also includes *The Canterbury Tales* (1971) and *Arabian Nights* (1974), and Paolo and Vittorio Taviani's *Maraviglioso Boccaccio* (2015).

Boccadiferro, Ludovico

Born: 1482, Bologna

Died: 1545, Bologna

Leen Spruit

Faculty of Arts and Center for the History of Philosophy and Science, Radboud University Nijmegen, Nijmegen, The Netherlands

Abstract

Ludovico Boccadiferro (1482–1545) was a student of Alessandro Achillini and taught philosophy in Rome and Bologna; he continued the moderately Averroist tradition of his

teacher, often finding himself at odds with Pomponazzi; he left numerous courses of lectures on the works of Aristotle, published after his death or still unpublished.

Alternate Names

Buccaferrea, Ludovico

Biography

Ludovico Boccadiferro was born in 1482 in Bologna from an ancient and illustrious family; he was the son of Girolamo and Apollonia Nordolia. He studied at the University of Bologna under Alessandro Achillini, and probably, from 1512 to 1513, he heard Pomponazzi, there. He graduated in philosophy and medicine on March 15, 1516. From 1516 to 1523, he taught logic and philosophy, and in 1520 he became member of the College of Physicians. In 1523 he became full professor, and in 1525 he moved to Rome, where he taught philosophy at the Sapienza University till 1527. He returned to Bologna, where he taught philosophy till 1545, commenting on *De anima*, *De coelo*, and *De physico auditu* (Lohr 1988). He also participated in broader discussions and attended the circle of scholars that later became the Accademia Bocchiana. Boccadiferro concluded his teaching in March 1545, and died on May 3 of this year. His pupils include Flaminio Nobili, Federico Pendasio, Alessandro Piccolomini, and Julius Caesar Scaliger.

In the University of Bologna, he represented the moderate strand of the Averroist tradition, following his master Achillini and in polemics with Pomponazzi, in particular as to the interpretation of Aristotle's psychology. Boccadiferro endorsed an Averroist solution to the issues of the immortality of the soul, the uniqueness of the intellect and intellectual beatitude. He was also interested in Plato's work, and in the final years of his career, he planned the composition of a summary of the *Laws*.

His works were published after his death mostly on the basis of the annotations of his

students: *Explanatio libri I Physicorum: Aristotelis* (1558, reprints in 1570 and 1603), *Lectiones in IV Meteororum* (1563), *Lectiones super I Metereologicorum* (1565), *Lectiones super tres libros De anima* (1566), *Lectiones in II et III Meteororum* (1570b), *Lectiones in Aristotelis Stagiritae libros quos vocant Parva naturalia* (1570a), *In duos libros De generatione et corruptione* (1571), and *Aristotelis de Physico auditu liber I Ludovici Buccaferreae praelectionibus ex Graecorum simul et Latinorum interpretum sententia explicatus* (1577).

Abstract

Traiano Boccalini's rather brief career as a satirical journalist for a very elite clientele in the first decade of the seventeenth century is complemented by the enormous resonance of his printed collection, the *News from Parnassus* (1613), throughout Europe. Although Boccalini's reports have since faded from public attention, they were wildly popular

in their time, due in part to their persistent association with Galileo in the aftermath of his *Starry Messenger* and *Letters on Sunspots*. They also provide a cautionary tale for those who, like the rulers of early modern Italy, wanted to provide their courtiers with political spyglasses and were determined to convert piecemeal revelations about current events into status and profit. In short, Boccalini's brand of "optical" newswriter functioned simultaneously as informer, auctioneer, and amateur astronomer. Boccalini's writings point to a familiarity with numerous (near-) contemporary sources, from Machiavelli to Renaissance comedy. As a result, Boccalini's legacy, because of its particular portability and suitability to much larger developments of modern political thought, affected a variety of scientific activities, ranging from the Academy of the Incogniti to Spinoza's library.

Biography

When Traiano Boccalini published the first and second series of his collection of essays, *De' Ragguagli di Parnaso* (*News from Parnassus*, 1612–1613), he was very near the end of his life, which he had spent in part in the study of the law and in part trying to secure different Apostolic commissions for himself. The child of an architect, Boccalini spent his childhood and adolescence in his native town of Loreto (near Ancona), which he later always eulogized as an endearing locale in contrast to Perugia and Padua, where he endured dull and miserable years of legal studies. While in Padua, in the last part of the 1570s – pursuing that legal training that required, in his words, “an ox's brain, a porter's body” – Boccalini also sustained a passion for the Roman historian Tacitus, whose moralism served to separate his readers from Machiavelli's political writings, a more typical interest in Renaissance Italy (Sterpos 1971).

In 1584, Boccalini married Ersilia Ghislieri in Rome, settling in the city to become a writer of Apostolic briefs; this activity would be soon flanked by the secretarial services he offered to

the Marquis Spinola in Genoa. The range of his personal patronage increased due to intervention of Cardinal Pietro Aldobrandini (1571–1621), the pope's nephew, who acted on the writer's behalf. Boccalini was almost 40 years old in 1592, when he was appointed by Clement VIII (1536–1605) to act as pontifical governor and magistrate in several small cities belonging to the church – among them, Trevi, Tolentino, Brisighella, Nocera Umbra, Comacchio, and Sassoferrato (Firpo 1969). In 1596, Boccalini also served as a lieutenant of Scipione Gottifredo in Benevento, and in 1598 he continued his diplomatic career with a mission to Venice. Amidst frustration, humiliation, and threats – including troubles with the Holy Office – Boccalini's wanderings throughout Italy also cemented his writing persona as that of a reporter, alternatively identified as *menante* or *gazzettiere* (De Vivo 2007), who objectively takes notes in all discussions: even when not enlisted in active courtly service, Boccalini would use such a posture as the narrative backbone of his allegorical-satirical fiction. After his writings attracted the attention of the Inquisition, Boccalini had to face trial twice, in 1604 and 1610. Following an acquittal, he finally moved to Venice, in a house of the neighborhood of Santa Maria Formosa, where he would reside until his death.

Boccalini died on 29 September 1613 in mysterious circumstances. Although his death was probably due to a liver tumor, the vitriolic attack he had launched on Spanish imperialism shortly before (Cozzi 1956) led to unfounded rumors of Spanish involvement in his death, either by poison or by physical assault. Thanks to the mediation of his longtime friend Angelo Grillo (1557–1629), a Benedictine priest and enthusiastic supporter of Galileo (1564–1642), who shared with him a fascination for the early media industry, as well as for its brokers and informers (Infelise 2010), Boccalini's body was buried in the church of San Giorgio Maggiore in Venice.

Heritage and Rupture with the Tradition

At first glance, Boccalini's final trajectory in Venice appears to be an ideal culmination of two

mutually reinforcing developments in the late sixteenth century – the skeptical orientation of the city's political thinking and the immense interest provoked by the printing press, its entourage, and the writers-for-hire who collaborated with it. According to its myth of republican freedom, Venice was the best locale for satirical activity, although in a 1611 letter to Scipione Borghese (BAV, Barb. Lat. 6458, c. 81), Boccalini explicitly expressed a desire to physically join the conversation of Roman elite circles, living off the profits of his printed works. Indeed, the *Ragguagli* became a European sensation because they inspired a host of reprints, translations, and imitations. As a result, the best historical approach to Boccalini's position vis-à-vis the ideals of Cinquecento Italy cannot be artificially separated from the heritage his work itself projected.

From the point of view of modern political thought, however, while in the original *Ragguagli* the sting of irony targeted specific projects to reform the world (Skinner 1978), in its seventeenth-century recounting the collection's biting satire took on a life of its own. For example, a prominent Rosicrucian writer from Tübingen in south-west Germany, Johann Valentin Andreae (1586–1654), paid tribute to Boccalini in his *Menippus* (1617), an anthology of one hundred satirical dialogues whose organization is heavily indebted to the Italian reports, where the guests of a courtly wedding have to pass over a giant scale, taken from the *Pietra del paragone politico* (1614), as well as in the *Mythologia* (1619), where Boccalini joins the ranks of other famed “satirical dogs” such as Lucian, Barclay, and Rabelais (Penman 2009). At this early stage after his death, the topical image of courtly life as a perilous navigation, which Boccalini developed from classical sources and from the *Avvisi di Parnaso* of Cesare Caporali (1531–1601), his immediate inspiration for writing in the Parnasian mode (2.23), had already become an international model of critique and “judicious” prose, to put it in Gracián's terms (Bosold 1996).

To better assess Boccalini's position within the literary and philosophical tradition of his day, one can conveniently use another posthumous episode. After a decade of protracted dealings with

the Venetian government concerning his father's estate, in 1623 Rodolfo Boccalini solicited the intervention of the Holy Office, hoping for a comprehensive censorship that, opportunistically, would raise the capital of the manuscripts now in his possession. It is symbolic that in the same discussions (Russo 2015) the cardinals of the Inquisition addressed the statement of correction written by Alessandro Tassoni (1565–1635) for his mock-heroic poem, the *Secchia rapita*, and discussed a petition for deeper cuts from Marino's *Adone*; remarkably, while the judgement on Tassoni and Marino was severe, no action was recommended in Boccalini's case. Evidently, his *Ragguagli* were seen as untroubling for the sociopolitical *status quo* – caustic, but not morally offensive.

How fair was the tribunal's opinion? On the one hand, historically speaking, this lackadaisical approach missed the mark, since one of Boccalini's close associates was the English ambassador Henry Wotton (1568–1639), who secured Marino's liberation from jail. Wooton was also the intermediary for a private anthology of Parnassian reports – now housed at the Bodleian Library in Oxford – that Boccalini prepared in 1612 for James I, and in which he defended the idea of dressing the naked truth with “comic masks” and metaphors. The Inquisition's unusual leniency, on the other hand, is hardly a surprise considering how Boccalini – as in his report of a double wedding for the House of Savoy in 1608, during Aldobrandini's papacy (*Ragguagli* 1.78) – decided to adopt an antiquarian stance, glossing the presence of renowned personalities such as Chiabrera, Monteverdi, and Marino himself with figures taken from classical antiquity, like Plautus and Terence, or from Ariosto (Russo 2015), as though he wished to attenuate the militant and contemporary import of his chronicle.

Paradoxically, at least in northern Italy, Boccalini was famous as a judge, not a man of letters. This adds a further layer to the *Ragguagli* and their intentional parade of Renaissance burlesque poetry (Ciri 2005), as in the description of a Parnassian feast in which the fabulous holdings of private and public libraries provide rich yet

uneven meals to its learned banqueters (Boccalini 1948: 1.31). Here Boccalini has virtually nothing new to say on the contemporary, seventeenth-century rearrangement of the world of letters, but in a characteristic twist of his newsmongering he returns instead to an earlier phase of the emerging Renaissance industry of rumors and reports by diluting and expanding on such parodic sources as Della Casa's “Oven,” Varchi's exercise on ricotta cheese, and Mauro's praise of fava beans. Elsewhere, as in 1.14, Boccalini denounced the decline of Italian academies, an episode that is reinforced by his scorn for “babbling poets” (1.2 and 1.7) and the troubled awareness of how, in Italy, the number of virtuosi has grown out of proportion thanks to the press (at 1.100, an emphatic position inside the collection). At times, Boccalini's polemic against the “brainy slackers” of his time (2.95) appears to carry little besides a bombastic effect; otherwise his target is clearer, as in 1.28, when he attempts to rescue Tasso from the use of him made by Castelvetro and other contemporary commentators of Aristotle.

Innovative and Original Aspects

To sum up, Boccalini's reports might give the false impression of being entirely conventional, within the sixteenth-century tenets of fantastic voyages to the Otherworld *sub specie libraria* – and indeed, the passage from verse to prose continued to appear like a slippery innovation, in 1614, when Cervantes wrote his *Viaje del Parnaso* (Cappelli 2001) – but it turns out that this perspectival illusion is deliberately engineered by the author of the *Ragguagli*. Of 64 authors cited by Boccalini under the pretext of his court proceedings, 24 are classical authorities, only one medieval (Dante), and not one is a Quattrocento humanist (Procaccioli 2015); in addition, of the remaining 39 writers, only a few correspond to our established canon of Cinquecento Italy, since Boccalini privileged satire and historiography, for instance, at the surprising expense of theater. Especially instructive is 3.72, based on literary pedagogy, but also

instructive are 1.35, 2.10, and the unpublished essays in MS 681 of the Palatina Library in Parma (Pini 2008), where Boccalini distances himself from the obnoxious availability of cheap prints, by indicting prestigious names like Giunti and Plantin, rather than the humble *colporteurs* or “messengers” such as his fictional self. Even if one considers the tribunal as a model for philosophical presentation, which enables a certain amount of light, however residual or negative, on the *doxa* put on trial – that is largely the case in the ominous presence of Machiavelli in *Parnassus* – and even if, moreover, one reflects on how conspicuous absences can speak louder than silence, Boccalini’s polemical goal is unmistakable. By emphasizing comedy and epistolography, he brought to rich consequences some embryonic hints not only in Caporali, his companion in legal studies in Perugia (Marconi 1998), but also in Giordano Bruno’s heavenly court of the *Spaccio de la bestia trionfante*, in certain bibliophilic fictions by Anton Francesco Doni (1513–1574) and Paolo Giovio (1483–1552), and especially in a carefully staged “dispatch from Parnassus”; the latter was included by Pietro Aretino (1492–1556) in the 1538 edition of his *Letters* and had received little attention.

In this light, the *Ragguagli* represent an original contribution at the intersection of two major developments, which are related to one another by the rhetoric of dissimulation and the culture of secrecy in early modern Europe (Bilotta 2011): first, the literature on the well-being of the body politic (Zaccaro 2002), whose long-term thrust was to deprive astrologers, in particular, of their traditional role as forecasters of coming events, and second, the diverse agenda of “Copernican” astronomy, whose claims and spectral presence, particularly in connection with Galileo Galilei and the observers of the Medici regime, would become increasingly pronounced only a decade after the first publication of the Parnassian news.

To all appearances, Boccalini spoke *of* and *to* Galileo. In turn the scientist, while in Padua, made inquiries about the writer through a common friend, Girolamo Magagnati (1565–1619), who following Boccalini’s own work on Roman

exemplarity wrote imperial biographies of Romulus and Numa; correspondence aside, Galileo was quick to react to the novelty of these writings. And as soon as he obtained a printed copy of the *Celestial Assembly Concerning the New Comet*, a work ostensibly written in the wake of *Ragguagli* that defended a Tychonic explanation of the recent phenomena (Besomi and Camerota 2000), he also set about planning a written answer to it. It is striking that such a riposte was meant to feature, in the style of Boccalini, a fast-paced procession of speakers. This demonstrates that, despite crucial theoretical differences, Tychonians and Copernicans coveted the same readership and immediately seized on the new vernacular genre of Parnassian reports. And since Galileo eventually abandoned his original plans for the *Assayer*, which in time became both bolder and more detailed, we can safely assume that to his eyes and those of collaborators like Paolo Sarpi (1552–1623), Boccalini stood out less for his content than as a prose stylist. In fact, Boccalini’s bulletins were, by comparison, *never* newsworthy (Reeves 2014).

Impact and Legacy

As a man of law, Boccalini would have appreciated the Index’s recognition that his *Ragguagli* did not have a strong political agenda and that their topical fervor was somewhat anticlerical, yet not openly antireligious. As a consequence, Boccalini’s European impact offered a kind of posture or orientation whose perspective was that of a well-educated, skeptical, and debonair reader (Varese 1958). In strictly Venetian terms, from Lepanto to the Interdict, Tassoni’s mock epic, Boccalini’s reports, and Galileo’s dialogues were strange co-travellers – all characterized by their manipulation of impolite laughter. In a manner of speaking, Boccalini gave Machiavelli the instrument of the telescope, understanding the political thinker as a figure able to turn astuteness into exercises of observation; sometimes, that meant focusing on the myopic image of the writer intent on writing, active simultaneously as *scriptor* and excerptor.

It has been recently established that, on the grounds of Boccalini's interest for the Machiavellian lexicon of *estrema rovina* and themes such as the useful "bone marrow" of political science, the *Ragguagli* can be read as a theatrical exposition of the wisdom matured in the *Commentaries to Tacitus* (Baldassarri 2015). Of course, the decision to concentrate on Tacitus and not Livy, as in the axis Machiavelli-Guicciardini, and the choice not to use *Discorsi* as a title (used instead by the historian Virgilio Malvezzi (1595–1654), a Lipsian writer and Christian neo-stoic, in 1622) indicate that Boccalini also had some ambiguity, if not animosity, toward the Florentine Secretary. Likewise, it is understandable that, whereas Boccalini's bulletins implied an audience well disposed to both the Veneto and Tuscany, his personal situation forced him to subtract some of the glamor from the Roman constitution in favor of the Venetian republic. In conclusion, Machiavelli's image, as it was shaped by Boccalini, remains significantly less engaged in moralizing discussions than in a militant position against abstraction in the study of the past (Figorilli 2015).

Boccalini's uncanny emphasis on optical devices and discernment entailed a high degree of semiotic redundancy, as did the repeated images of scribal tampering and spying that one finds in Boccalini's imitators, namely, in the *Ragguagli di Parnaso* by Girolamo Brusoni, written in Florence between 1633 and 1636, the *Avvisi di Parnaso* by Marco Antonio Nali, of 1644, which brings Boccalini's invention to a maximum of normative predictability, and particularly the *Corriero svaligiato* by Ferrante Pallavicino, of 1641. Pallavicino's echo of Boccalini's episode in 2.58 concerning troubles with Venetian magistrates, however, had only a rather local resonance; in reality, it was with the aforementioned *Pietra* – a collection of dispatches expressly conceived for transalpine markets – that Boccalini earned a full European stature (Longoni 1999), although his influence on the Academy of the Incogniti in Venice (Beniscelli 2015) continues to be the noteworthy and relatively neglected episode of a new epistemic genre enabling a translation across different disciplines and the circulation of Plutarch and Justus Lipsius, among others, to the Veneto.

While Frances Yates' framing of Boccalini as a hinge between the hermetic tradition and later skeptical developments (Yates 1964) received a lukewarm evaluation (Vickers 1979), Harald Hendrix's research on Boccalini as the "cultural conscience" of the intelligentsia in seventeenth-century Europe has been the foundational backbone of modern scholarship (Hendrix 1995), with the paradoxical corollary that we now have more studies on the critical fortune of Boccalini than on his thought (Guaragnella 2015). Furthermore, given Hendrix's focus on historiography and politics, some aspects of his legacy, namely, the favorable gesturing to Boccalini of the Paduan-Venetian circles of Galileo, Sarpi, and Pinelli, remain unclear, having received little attention. By contrast, building on Hendrix's insightful emphasis on the role of the Low Countries for the dissemination of Boccalini's ideas, more recent work has detailed the indirect debt of Spinoza, whose knowledge of Boccalini depended on one of the writer's most formidable followers, Christoph Besold (Mignini 2015). It is interesting to observe how Spinoza's intervention on the "Machiavellian" debates about the *arcana imperii* makes use of Boccalini's expressions such as the dog's false teeth or the mole's eyes, a variant of which is also found in Bruno's *Cena de le ceneri*. By then, the optical theme so characteristic of Boccalini's mercurial peddling of news had gone full circle.

Department of English Studies, University of Cyprus, Nicosia, Cyprus

Abstract

This essay presents the French jurist, statesman, and humanist philosopher Jean Bodin, who was one of the most prominent political theorists of the sixteenth century. Bodin is more widely known for this contribution to the theory of

sovereignty which he formulated in his monumental treatise published in 1576 under the title *Les Six livres de la République* (*The Six Books of the Commonwealth*). But besides this work, Bodin's writings include various other texts that reveal his erudition and profound engagement with a much wider range of topics, from natural philosophy and religion to political economy and historical methodology. His major works include the *Methodus ad facilem historiarum cognitionem* (*Method for the Easy Comprehension of History*, 1566), *La réponse aux paradoxes de Malestroït* (*Response to the Paradoxes of Malestroït*, 1568), *De la démonomanie des sorciers* (*On the Demon-Mania of Witches*, 1580), *Colloquium heptaplomeres de rerum sublimium arcanis abditis* (*Colloquium of the Seven about Secrets of the Sublime*, written in the 1580s but first published in 1857), and *Universae naturae theatrum* (*The Theatre of Universal Nature*, 1596).

Biography

Jean Bodin was born in 1529 or 1530 (perhaps at Angers) to Guillaume Bodin, a merchant in the textile business based at Angers, and Catherine Dutertre. He joined the Carmelite order at an early stage in his life, but he was released from his vows sometime in 1548–1549, possibly on the grounds that he had professed while he was too young. During his time as a Carmelite, he was sent to Paris where he acquired an impressive humanist education studying at the Collège Royal. While in the French capital, he came in contact with various intellectual trends and controversies and showed special affinity for the teachings of Peter Ramus whose lectures he probably attended and the influence of whom may be traced, as has been argued, in a number of Bodin's writings (McRae 1955). He left Paris around 1550 and spent the following decade furthering his studies by pursuing law at the University of Toulouse. By the end of the 1550s, his ambition for an academic career in Toulouse was frustrated as he did not manage to obtain a professorship at the university there. This also marked the end of this stay in Toulouse.

Thus, around 1561 he went back to Paris where he found employment as an advocate at the parlement. In the following years, he also started publishing some of his major works, and this enabled him to establish himself as a prominent figure in the political and intellectual society of Paris. Following the publication of his *Methodus* in 1566, another significant text by Bodin appeared in print in 1568 under the title *Les Paradoxes de Monsieur de Malestroït* [...] avec la réponse de M. Jean Bodin ausdicts Paradoxes in which he analyzes the problem of high inflation that afflicted sixteenth-century Europe. Thus, by the end of the 1560s, he managed to attract the attention of King Charles IX who assigned him around 1570 with various political and administrative tasks. In the following year, he also entered the service of Francis, duke of Alençon (who was second in line to the throne after Henry III), as counselor, a position that significantly furthered his prospects for a career at court.

Bodin continued having a significant role at the very center of French political power after the death of Charles IX and the accession to the throne of his brother Henry III in 1574, while his acclaim was more firmly established with the publication in 1576 of the *Les Six livres de la République* (*The Six Books of the Commonwealth*), a work that enjoyed much positive reception within considerable part of the political elite of the country. At the time of the *République's* publication, France was notably still ravaged by the devastating wars of religion between Catholics and Huguenots. Within this context, Bodin's advocacy of the idea in the *République* that order could best be maintained if the ruler enjoyed absolute and indivisible sovereign power was warmly received by many.

However, Bodin's prospects for a successful courtly career suffered a setback in 1576 when he opposed Henry III's fiscal policies at the estates general of Blois (himself serving as representative for the third estate of Vermandois). Bodin, who saw the king's attempt to enforce new taxation as a measure that overburdened an already heavily taxed third estate, makes reference in his journal of the assembly of the estates general to his "determination to serve the 'public good

(*le bien du peuple*)’ even at the cost of forfeiting the king’s goodwill” (Lloyd 2013, 5). Perhaps for Bodin this opposition was not inconsistent with his belief in the king’s sovereign power and authority. However, as a result of this action he lost the favor of Henry III, and his hopes for a more prestigious political appointment at court were frustrated.

In the same year, 1576, Bodin moved to Laon having married the widow of a Laon official. While there, he employed himself in the service of the duke of Alençon whom he accompanied in 1581 on a trip to England that had the purpose of pursuing the duke’s matrimonial suit with the English queen, Elizabeth I. The Duke of Alençon’s sudden death in 1584 also marked Bodin’s definitive disengagement with the world of courtly affairs and high politics, though in 1587 he succeeded his deceased brother-in-law coming to the office of king’s attorney in Laon, a position that he continued holding until his death in 1596.

Bodin’s last few years in Laon were beset due to the eruption of a new cycle of civil strife in the country over succession to the throne following the assassination of the king in 1589. Following this event and until 1594, Laon fell under the political control of the Catholic League that opposed the Protestant Henry of Navarre’s claim to the throne (despite the fact that this claim was more legitimate on the basis of French law than that of his opponent, Cardinal Charles of Bourbon). The league clearly violated a number of the ideas advocated by Bodin in his political writings (more prominently, the principle of legitimacy). Yet, Bodin appears to have been forced to accept its rule and collaborate with it under fear of losing his position, his property, and possibly his life. His support for Henry of Navarre was only expressed in 1594, after Laon came under the control of the Protestant forces.

Despite the fact that Bodin’s last few years in Laon were politically so troubling, the two decades he spent there until the end of his life were immensely productive intellectually, and some of his most influential works were written during this period. These include his highly influential treatise on demonology and witchcraft (*De la démonomanie des sorciers*) that was published

in 1580 and his impressive treatise on religion, his *Colloquium heptaplomeres*, which was finished by 1593 but only came to be published decades later (probably due to the fact that it would put Bodin under the accusation of heresy). His remarkable contribution to the field of natural philosophy, his *Universae naturae theatrum* (*The Theatre of Universal Nature*), was published posthumously in 1596, the same year of Bodin’s death from the plague.

Heritage and Rupture with the Tradition

Bodin’s acclaim as a philosopher is largely based on his contribution to the field of political theory and, more specifically, on his contribution to the theory of sovereignty which he formulated in his monumental treatise published in 1576 under the title *Les Six livres de la République* (*The Six Books of the Commonwealth*) – a work that also includes one of the earliest treatments of slavery as an unnatural institution that is not only contrary to the dignity of human beings but also a constant threat to political stability. Besides this work, Bodin’s writings include various other texts that reveal his erudition and profound engagement with a much wider range of topics, from natural philosophy and religion to political economy and historical methodology. His first important work was his *Methodus ad facilem historiarum cognitionem* (*Method for the Easy Comprehension of History*, 1566), which provides an attempt to advance a clear and concise method for the study of history. Another important work published by Bodin in this early stage of his career was *La réponse aux paradoxes de Malestroit* (*Response to the Paradoxes of Malestroit*, first published in 1568 and in a revised version in 1578), in which he produced one of the earliest formulations of the quantity theory of money. Other important works followed the publication of the *République* in 1576. These include *De la démonomanie des sorciers* (*On the Demon-Mania of Witches*, 1580), a treatise that examined the topic of demonology and witchcraft, and the *Colloquium heptaplomeres de rerum sublimium arcanis abditis* (*Colloquium of the Seven about*

Secrets of the Sublime, written in the 1580s but first published in 1857), a work that advances the largely unorthodox for the context of the sixteenth century idea of religious toleration. Bodin's last major work was *Universae naturae theatrum* (*The Theatre of Universal Nature*), published in the year of his death in 1596. This work provides the culmination of some of the ideas previously explored by Bodin in the *Démonomanie* and the *Colloquium heptaplomeres* as it brings natural philosophy into dialogue with the pursuit of religious knowledge. The rest of this section provides a survey of Bodin's heritage by introducing his major works and the central questions they engage with.

Bodin's Methodology of History: The *Methodus*

First published in 1566, Bodin's *Methodus ad facilem historiarum cognitionem* (*Method for the Easy Comprehension of History*) was written with the purpose of advancing a clear and concise method for the study of history. The book – that run through thirteen Latin editions from the year of its publication to 1650 – provided Bodin's first important work and laid the basis for the examination of a number of ideas that he was subsequently going to develop in greater detail in other works. (See Couzinet 1996.)

As Beatrice Reynolds suggests, Bodin's writing of the *Methodus* reflects his engagement not only with “the universal and eternal question of the interpretation of history” but also by “the narrower and more timely problem of the nature of government in France” during the period in which he wrote (Reynolds, “Introduction,” in Bodin 1945, x). Further, in the *Methodus* Bodin “revealed the trends of his era in that his philosophy of history moved away from the authoritarian toward the natural – in this case, toward the pseudoscientific” (Reynolds, “Introduction,” in Bodin 1945, xi). The book consists of ten chapters in which Bodin exposes his theory on how history should be studied. Chapter 1 starts with the assertion that history may be divided in three types:

Of history, that is, the true narration of things, there are three kinds: human, natural, and divine. The first

concerns man; the second, nature; the third, the Father of nature. One depicts the acts of man while leading his life in the midst of society. The second reveals causes hidden in nature and explains their development from earliest beginnings. The last records the strength and power of Almighty God and of the immortal souls, set apart from all else. (Bodin 1945, 15)

The *Methodus* foreshadows Bodin's engagement with all three types of history, containing ideas that were later developed in the *République*, the *Theatrum*, and the *Colloquium heptaplomeres*: these three works addressed human, natural, and divine history, respectively. However, the *Methodus* concentrates on the first type of history, on “human actions and the rules governing them,” this being considered by Bodin, the first necessary step in a process toward the examination and full understanding of the history of nature and God. As he further highlights, the study of human history is essential “for acquiring prudence . . . because episodes in human life sometimes recur as in a circle, repeating themselves” (Bodin 1945, 17).

Bodin then proceeds in Chaps. 2 and 3 to establish his methodology for the proper study of history. Here he talks about the need to establish a certain order in the study of historical events, pointing to the merits of a sequential reading of history that starts from earlier accounts and proceeds in chronological order to more recent periods. Also he refers to the significance of reading history within the context of other related fields, such as geography and cosmography, and suggests the method of proceeding from an examination of more general accounts to more detailed ones as a means of comprehending the whole. Further, he highlights the need for systematic note-taking. But before notes are taken, one needs to make a correct choice of historians and a good assessment of one's material. Chapters 4 and 5 thereby concentrate on these issues, citing Aristotle's advice to students of history: that they should neither believe all they read nor discredit sources outrightly. Bodin also emphasizes the significance of reading history without having any emotional bias, something that is more easily achieved when one examines from a certain chronological or geographical distance.

Chapter 5 of the *Methodus* also presents Bodin's formulation of his climate theory by advancing the idea that the temperament of people is influenced by such factors as climate and geography. As noted by M. J. Tooley, in his development of this theory (that ultimately found its source in Aristotle), Bodin drew "upon some common stock of scientific notions familiar to his contemporaries," on the basis of which he offered "a masterly summary of about two thousand years of speculation" (Tooley 1953, 64). This climate theory suggests that the form of a state as well as its legal system should be adjusted according to the characteristics of its people as those are defined by its climate and geographic location and features.

These ideas would subsequently be developed in greater detail by Bodin in the *République*. This also applies to the ideas presented in Chap. 6 that is entitled "The Type of Government in States." This chapter, which is notably the largest taking up more than one third of the book, laid the basis for Bodin's exploration of many of the issues addressed the *République*. Chapter 7 of the *Methodus* provides a refutation of the Biblical narrative of four monarchies as well as a rebuttal of the classical myth of a golden age which is criticized for its naiveté. Following Chap. 8 that is entitled "A System of Universal Time," Bodin then proceeds in Chap. 9 to address the origins of races and introduce criteria by which to define these. The book concludes with a bibliographical chapter entitled "The Order and Collection of Historians."

Bodin on Sovereignty: *The République*

Bodin's treatment of the concept of sovereignty in *Les Six livres de la République* was his most important contribution to the field of political science. The work was first published in French in 1576 and a Latin version of the text by Bodin himself first appeared in print 10 years later (with extensive revisions). In English, it was first made available in 1606 in a translation by Richard Knolles. This was preceded by the publication of translations in various other languages that made

the text more widely available to European audiences: an Italian one in 1588, another one in Spanish in 1590, and one in German in 1592.

Bodin's famous definition of sovereign power appears at the beginning of Chap. 8 of the first book of the *République*, following chapters that concentrate on such issues as the primary ends of a commonwealth, the difference between a commonwealth and a family, and the power of fathers, and husbands, as well as the power of masters and the institution of slavery. As Bodin asserts in this highly influential formulation of the concept:

Sovereignty is the absolute and perpetual power of a commonwealth, which the Latins call *maiestas*; the Greeks *akra exousia*, *kurion arche*, and *kurion politeuma*; and the Italians *segniora*, a word they use for private persons as well as for those who have full control of the state, while the Hebrews call it *tomech shévet* – that is, the highest power of command. (Bodin 1992, 1)

Having provided this definition of sovereignty, Bodin then proceeds to define the terms "absolute" and "perpetual." As he suggests in his analysis of the latter, a person that is given absolute power for a limited period of time cannot be called a sovereign prince, but a mere trustee or custodian of that power, lawful possession of which always remains with the person or persons who gave it to him. For example, if a sovereign prince gives power of command to a regent for a certain time (for instance, as a means of relieving himself of the burden of certain part of government), this does not compromise his own power as a sovereign as he remains in possession of the power he has assigned to the regent, and the regent merely holds that power in trust. This "lieutenant," Bodin comments, "has nothing of his own and remains answerable for his charge to the person of whom he holds the power to command, unlike a sovereign prince who is answerable only to God" (Bodin 1992, 4). Accordingly, the person who holds power in trust goes back to being a private citizen when the definite period of time for which he was assigned this power expires. Unlike this limited form of power that is "revocable at the good pleasure of him who granted it," sovereign power is not limited with regard to time and may not be revoked but is "perpetual" in the

sense that it lasts “for the life of him who has the power” (Bodin 1992, 6). Likewise, sovereign power is unlimited with regard to its functions. Sovereignty being both “perpetual” and “absolute,” Bodin highlights, it “is not limited either in power, or in function, or in length of time” (Bodin 1992, 3).

Bodin’s definition of the term “absolute” employs his understanding of the concept of a “true gift,” as opposed to a gift which is not true or authentic. A “true gift,” he suggests, is a gift that “carries no further conditions, being complete and accomplished all at once, whereas gifts that carry obligations and conditions are not authentic gifts. And so sovereignty given to a prince subject to obligations and conditions is properly not sovereignty or absolute power” (Bodin 1992, 8). Sovereignty is only absolute in the proper sense when no obligations or conditions are attached to it as such elements would compromise its function. On the basis of this idea, a ruler becomes sovereign when those who possess sovereignty (e.g., the people or the aristocracy) “purely and simply give [him] absolute and perpetual power to dispose of all possessions, persons, and the entire state at his pleasure and then to leave it to anyone he pleases, just as a proprietor can make a pure and simple gift of his goods for no other reason than his generosity” (Bodin 1992, 7–8). As Bodin clarifies, the power given to such a ruler is not in any way compromised “if the conditions attached at the creation of a prince are of the law of God or nature” (Bodin 1992, 8). For, while sovereignty carries no other obligations or conditions, it is always subject to the laws of God and the laws of nature as well as “to various human laws that are common to all peoples” (Bodin 1992, 10).

Sovereignty and Law

Another issue that is central to Bodin’s definition of sovereignty concerns the relation between the sovereign and law. As he points out in his discussion in Chap. 8 of the first book of the *République*, the ability of the sovereign to give law to his people as well as the ability to change or repeal

laws when he deems it necessary is one of the defining characteristics of sovereign power:

persons who are sovereign [...] must be able to give the law to subjects, and to suppress or repeal disadvantageous laws and replace them with others – which cannot be done by someone who is subject to the laws or to persons having power of command over him. (Bodin 1992, 11)

On the basis of this idea, he draws the conclusion that the sovereign “is not subject to the law” – just as he “must not be subject in any way to the commands of someone else” (Bodin 1992, 11). As a means of supporting this, Bodin argues that the idea of making laws for one’s own self carries a contradiction in terms or an impossibility, “for although one can receive law from someone else, it is as impossible by nature to give one’s self a law as it is to command one’s self to do something that depends on one’s own will” (Bodin 1992, 12). This, for Bodin, highlights the incompatibility between the role of the sovereign as lawmaker and the position of someone who is subject to the law. Thus, the sovereign is said to hold a position above the law, and this covers not only his own laws but also the laws of his predecessors: the sovereign is not subject to the latter as this would compromise his absolute power. Accordingly, a sovereign prince is free either to ratify or to change and repeal the laws of his predecessors as he pleases.

As Bodin further clarifies in this chapter, it may be advisable for sovereign princes to obey their own laws. However, this is not because they have any obligation to do so but because that is an effective means for them to secure the submission of their subjects: “for there is nothing,” he argues, that makes a sovereign prince “more feared and revered by his subjects” than his keeping of his own laws, “whereas, on the contrary, there is nothing that more abases the authority of his law than his own contempt for it” (Bodin 1992, 31).

The power of the sovereign to make law is further discussed by Bodin in Chap. 10 of the first book of the *République*, where he analyzes the marks of sovereignty. As he reiterates in this chapter, “it is only sovereign princes who can make law for all subjects without exception, both collectively and individually”

(Bodin 1992, 52). Here, the sovereign's lawmaking capacity is presented as having such central significance that it is described as the first and foremost mark of sovereignty that provides the basis for all the rest of the sovereign's rights:

This same power of making and repealing law includes all the other rights and prerogatives of sovereignty, so that strictly speaking we can say that there is only this one prerogative of sovereignty, inasmuch as all the other rights are comprehended in it – such as declaring war or making peace; hearing appeals in the last instance from the judgements of any magistrate; instituting and removing the highest officers; imposing taxes and aids on subjects or exempting them; granting pardons and dispensations against the rigor of the law; determining the name, value, and measure of the coinage; requiring subjects and liege vassals to swear that they will be loyal without exception to the person to whom their oath is owed. These are the true prerogatives of sovereignty, which are included in the power to give law to all in general and to each in particular, and not to receive law from anyone but God. (Bodin 1992, 58–59)

As Bodin also emphasizes in this chapter, the sovereign does not simply have the power to make laws but to do so “without the consent of any other, whether greater, equal, or below him” (Bodin 1992, 56).

On the Indivisibility of Sovereignty

Following from Bodin's discussion of sovereignty and its main attributes (and especially the sovereign's prerogative to make law without the consent of anyone else) is the conclusion that this supreme type of power cannot be divided but has to reside with a single person or group. As Bodin clearly asserts, “the prerogatives of sovereignty are indivisible” (Bodin 1992, 104), and on the basis of this notion, he further suggests that the idea of a mixed state (i.e., a state that combines the principles of different constitutional forms, such as monarchy with aristocracy or democracy) is not simply contradictory but also highly untenable:

But [really] to combine monarchy with democracy and with aristocracy is impossible and contradictory, and cannot be even imagined. For if sovereignty is indivisible, as we have shown, how could it be shared by a prince, the nobles, and the people at

the same time? The first prerogative of sovereignty is to give the law to subjects. But who will be the subjects and who will obey if they also have the power to make law? (Bodin 1992, 92)

As Bodin argues here, the division of sovereignty (and thereby also of the power to make law) can only lead to political instability, constitutional chaos, and ultimately the failure of the state – a failure that can only be remedied if sovereignty returns to a single agent (be it to a king, the nobility, or the people – in which case the constitution would be monarchy, aristocracy, or democracy, respectively). “Hence,” he suggests, “it must always come to arms until such time as sovereignty resides in a prince, in the lesser part of the people, or in all the people” (Bodin 1992, 104). Out of the three constitutional forms available, Bodin clearly positions himself in favor of monarchy as the most tenable form that avoids the possible ambiguities and contradictions that he traces in the other two forms. Irrespectively of which constitutional form may be chosen though, Bodin highlights the significance of preserving the sovereign power indivisible: as he emphasizes, this indivisibility is a necessary prerequisite for the preservation of unity in the state and a *sine qua non* for its continuation.

As Julian H. Franklin has pointed out, “the idea that concentration of power in the ruler is an essential condition of the state as such might seem at first sight to be deliberately absolutist.” Indeed, Bodin's discussion in the *République* suggests that “apparent restraints on royal power were not constitutional requirements, but mere recommendations of prudence and good government.” However, Franklin notes, Bodin's earlier writings point to a somewhat position. In his *Methodus*, for instance, he does not appear to have been an absolutist. The *République* therefore registers a certain shift in Bodin's political thought (“Introduction,” in Bodin 1992, xiii).

The Laws of God and Nature and How They Limit Sovereign Power

Even the *République* though contains traces of how the sovereign's power may be in some ways

limited – for, at the same time that he defines sovereign power in terms of the sovereign’s position above positive law – Bodin also highlights that the sovereign always remains subject to the laws of God and nature. These, he notes, are laws that sovereign princes have no right to disregard or override.

unless they wish to be guilty of treason against God, and to war against Him beneath whose grandeur all the monarchs of this world should bear the yoke and bow the head in abject fear and reverence. The absolute power of princes and of other sovereigns lordships (*seigneuries souverains*), therefore, does not in any way extend to the laws of God and of nature. (Bodin 1992, 13)

The laws of God and of nature introduce certain limits to sovereign power which are discussed by Bodin with closer reference to such issues as property and human life. For instance, as he argues, the prohibition to murder may apply to a sovereign prince as much as to his subjects. However, this is not due to the sovereign prince’s obligation to any relevant positive laws, but because that is dictated by the law of God and of nature:

But if the prince forbids killing on penalty of death, is he not then bound by his own laws? I say that this law is not his law but the law of God and of nature, to which he is more strictly bound than any of his subjects, from which he cannot be dispensed either by the Senate or the people, and for which he is always answerable to the judgement of God, whose inquiry, said Solomon, is very rigorous. (Bodin 1992, 31)

Likewise, Bodin suggests that the sovereign has no right to lay hands on the private property of his subjects without their consent as the law of God dictates that “it is illicit to take, or even to covet, another person’s goods” (Bodin 1992, 39). This rule, which safeguards the inviolability of private property vis-à-vis the voracious drives of ruthless rulers, has one possible exception according to Bodin. Normally, he says, a ruler is not entitled to take his subjects’ property “without just and reasonable cause,” but such reasonable cause may be said to exist when the commonwealth is under threat and such an action is required “for the preservation of the state” (Bodin 1992, 39). In such a situation (that might

involve, for instance, emergency taxation for the needs of warfare), Bodin notes that subjects should be expected by “natural reason” to place the public good above their personal interest and thereby to willingly give up their possessions “for the welfare of the commonwealth” (Bodin 1992, 40).

Bodin on Slavery

Bodin’s treatment of the question of slavery appears in the fifth chapter of Book 1 of *The République*. This chapter, which significantly interrogates slavery as an unnatural institution that contravenes human dignity, firmly established Bodin as one of the earliest abolitionists during this period. Bodin’s discussion here challenges the well-known Aristotelian treatment of slavery as a natural condition: for Aristotle, who advances this idea in the *Politics* (1254a–1255b), some people are born to be masters while others – those who are “capable of belonging to another” as they “participate in reason so far as to apprehend it but not to possess it” – are born to be slaves and obey others. This distinction is also reflected, according to Aristotle, in the bodily attributes of each group, with slaves naturally made “strong for necessary service” and masters made “erect and unserviceable for such occupations” (Aristotle 2005, 23). On the contrary, for Bodin, slavery is not simply a disgraceful condition that is against the dignity of the human kind but also a violation of the law of God and an affront to reason.

As has been argued, Bodin’s hostility to slavery may be said to reflect a broader set of attitudes toward slavery in sixteenth-century France, where great part of the population was only set free from personal servitude about a century earlier. On the basis of this reading, the memory of serfdom, as well as the fear of returning to that condition, produced a largely negative set of attitudes toward slavery – this despite the fact that the development of the slave trade and New World slave labor would subsequently contribute to the establishment of France as a colonial power (Heller 1994, 53–54). But, as has also been suggested, Bodin’s

opposition to slavery was above all shaped by his views on sovereignty and the state: while others “regarded the emergence of the strong state as a threat to human liberty, Bodin held that a strong state was the trustee of a citizen’s rights and possessions,” and “slavery not only robbed a whole class of humanity of such civic rights, but in so doing represented a permanent threat to the stability of the state” (Heller 1994, 54). Indeed, as Bodin suggests (in a point that reveals the relevance of his discussion in this chapter to his broader treatment of political power and sovereignty in *The République*), the long history of slavery and violent slave insurrections clearly shows that far from being a useful institution, slavery in fact undermines the state as it poses a continual threat to political order and stability. Thus, for a state to enjoy long-lasting stability no such institution should exist, and slaves should be given rights of citizenship (a point that he also extends to wage laborers).

Bodin on Economics: Malestroït’s Paradoxes and Bodin’s Quantity Theory of Money

Even though Bodin’s fame is largely based on his writings in the field of political philosophy, he also made a significant contribution to the field of economics and has been credited as the “pioneer formulator” of the quantity theory of money (O’Brien 2000 and 2007). Bodin’s introduction of this idea may be found in *La réponse aux paradoxes de Malestroït* (*Response to the Paradoxes of Malestroït*) that was first published in 1568 and then in a revised edition 10 years later. This text was written in response to a treatise published in 1566 under the title *The Paradoxes of the Seigneur de Malestroït on the Matter of Money* – a treatise that sought to address the issue of inflation, the unchecked growth of which was becoming a pressing problem for the economies of many European countries in the sixteenth century, including France. The central argument of this treatise was that in the last 300 years the prices of commodities had remained constant in terms of the precious metals. The main example used in

support of this claim was that of velvet which was presented as having a constant price in terms of the precious metals since the fourteenth century. Attempt was also made to extend this argument over perishable commodities, such as corn and wine. Thus, according to Malestroït’s *paradoxes*, the rises in the prices of commodities were “simply changes in the unit of account, resulting from debasement” (O’Brien 2007, 19) – debasement being a process that “involved adding low-value metals to the coinage, spreading the supply of gold and silver further” (O’Brien 2007, 12).

Bodin’s *Response* refuted Malestroït’s arguments first of all by challenging the validity of his data which he exposed as erroneous. According to Bodin’s own argument, for instance, it was highly doubtful whether velvet actually existed in the fourteenth century – so, Malestroït’s whole argumentation regarding its price in relation to precious metals during that period could not but be mistaken. Further, Bodin pointed out that the factor of debasement that was so central in Malestroït’s analysis could not, on its own, adequately account for the rampant inflation witnessed in France and other European countries in the sixteenth century. While Bodin’s refutation of Malestroït’s claims was in itself a remarkable achievement that exhibited his outstanding grasp of economic data, his contribution to economics in the *Response* is primarily distinguished due to his own analysis of the causes of inflation. Besides debasement (which he acknowledged as a possible cause of inflation), Bodin identified four other possible causes: (1) the abundance of gold and silver, (2) monopolies, (3) scarcity caused by factors such as export trade and waste, and (4) fashionable demand by the upper social and economic classes for luxury goods (O’Brien 2007, 22). Out of these five causes, Bodin identified the abundance of gold and silver as the most significant one, aptly noting that in the sixteenth century the supply of these two precious metals was far greater than it had ever been in the past 400 years. Indeed, this observation appears to have been valid as the development of colonization led to a constant and unprecedented influx of precious metals in European countries. The great impact of this influx was more directly seen in

Spain as gold and silver were mainly drawn from Spanish colonies, but, as has been noted, “France, as an immediate neighbor, linked both by trade and by labour mobility,” also “felt the impact quite soon” (O’Brien 2007, 13). Bodin’s analysis of the significance of this abundance of gold and silver laid the framework for this formulation of the quantity theory of money, which in simple terms involves the idea that the supply of money has a direct impact on the level of prices and, thereby, that the increase in the supply of money may cause the prices of commodities to rise.

Bodin on Witchcraft: *De la démonomanie des sorciers*

In 1578 Bodin served as judge in the proceedings against a woman called Jeanne Harvillier who was accused of witchcraft. The woman was found guilty of the offense and was thereby sentenced to death. Upon this occasion, Bodin wrote his treatise on witchcraft that was first published in French in 1580 under the title *De la démonomanie des sorciers* (*On the Demon-Mania of Witches*).

In his preface to this text, Bodin makes reference to the Harvillier case which is used as a starting point for his analysis in the rest of the book of his views on the world of spirits and the subject of witchcraft. As he explains, he was prompted to write his treatise “because there were some who found the case strange and almost unbelievable” (Bodin 1995, 37). The main purpose of the book – the title of which was chosen “on account of the madness which makes [witches] chase after devils” – is “to serve as a warning to all those who read it, in order to make it clearly known that there are no crimes which are nearly so vile as this one, or which deserve more serious penalties” (Bodin 1995, 37). Also, citing the example of the Italian Pietro d’Abano “who tried to teach that there are no spirits” but finally proved to be one of his country’s greatest witches, Bodin says that he wrote his book so as “to respond to those who in printed books try to save witches by every means, so that it seems Satan has inspired them and drawn them to his line in order to publish these fine books” (Bodin 1995, 37).

As Bodin further informs his readers in his preface, the *Démonomanie* is divided into four books which aim to facilitate the comprehension of this difficult subject. The first book starts by providing his definition of a witch, a term that is broadly employed to refer to someone who has allied himself to the devil and has espoused demonic practices, the main purpose of which is to destroy the works of God. Then, the book proceeds to talk about the association of spirits with men, the difference between good and evil spirits (or angels and demons, as they are called), as well as the difference between lawful and unlawful means to learn hidden things and accomplish something one wants. This book also refers to certain practices associated with witches, such as teratology, haruspicy, ornithomancy, and hieroscopy. The second book refers to the different types of magic and to the tacit and formal ways in which evil spirits may be invoked. Further, it examines various questions, such as whether those who expressly renounce God and their religion are bodily transported by evil spirits, whether evil spirits can transform men into beasts, whether witches copulate with demons, and whether witches can inflict illness, sterility, sexual dysfunction, or death on men and beasts. As Bodin clarifies in the preface, this book discusses “the illicit arts and methods of witches,” without yet offering anyone “the opportunity to use it for wicked gain.” The purpose of this information, he explains, is to “show the traps and snares which one must avoid, and assist judges who do not have the leisure to research such matters, but wish nevertheless to be instructed in order to establish a judgement” (Bodin 1995, 44). The third book refers to various lawful and unlawful ways to prevent or drive away spells and witchcraft and addresses questions such as whether witches may use their practices so as to earn the favor of people or obtain such things as beauty, wealth, and learning.

The fourth book of the *Démonomanie* encapsulates Bodin’s overall condemnation of witchcraft and reveals the extreme severity with which he countenanced this practice. This part concentrates, in particular, on how to investigate cases of witchcraft and proposes how to proceed against

witches, outlining the evidence that is required in order to prove the crime. Proof may be found, according to Bodin, in such evidence as the testimony of reliable witnesses but also in the voluntary confession of the person accused of witchcraft. This, he suggests, may be considered as indisputable proof, as opposed to forced confession that does not provide sufficient proof. Finally, this fourth book examines the kind of punishment witches should receive, with Bodin clearly taking a position in favor of the death penalty. This sentence, he clarifies, should only be reserved for those cases where there is solid proof of guilt, and he emphasizes the need for competent and well-trained judges who will be able to properly evaluate the evidence. Indeed, as he firmly advocates pointing to the significance of solid and indisputable proof, it is far more preferable to acquit someone who is guilty than to condemn someone who is innocent. However, as he points out, for those cases where solid proof is provided, the person accused of witchcraft should be punished with nothing less than painful death. At this point, he also returns to the case of Jeanne Harvillier that is cited as an indisputable example of a witch who allied herself with Satan and therefore merited the death penalty.

The *Démonomanie* enjoyed considerable popularity following its publication in 1580, and besides its numerous editions in French it was also soon translated into various other languages (into Latin and German in 1581 and then in Italian in 1587). It has been considered by scholars as a highly influential book that contributed to the increasing persecution of witchcraft in the decades that followed its publication. Many of its readers have been puzzled by the intolerance Bodin expresses here, an element that is seen as largely inconsistent with the views expressed by him elsewhere. Indeed, as has been pointed out, a number of scholars “have been shocked and perplexed at the apparent contrast between the ‘modern,’ ‘rational’ political Bodin” found in the *République*, or “the ‘tolerant’ religious Bodin” found in the *Colloquium heptaplomeres*, “and the ‘intolerant’ and ‘superstitious’ Bodin of the *Demon-Mania*.” For others, this apparent inconsistency is merely “the result of applying

nineteenth- and twentieth-century mental categories to a thinker of a very different age” (Jonathan L. Pearl, “Introduction,” in Bodin 1995, 11). On the basis of this interpretation, Bodin’s severe condemnation of witchcraft in the *Démonomanie* is not inconsistent with his overall views on the role of religion in human existence, God’s relation to the universe and to man and further to his wish for the majesty of God to be honored: demonism and witchcraft (very much like atheism) were a direct affront to this idea and acts of treason against the glory of God.

Bodin on Religion: The *Colloquium Heptaplomeres* and Religious Tolerance

Bodin’s engagement with the issue of religion and its role in human existence may be found in a number of his writings, but more prominently in the *Démonomanie*, as well as the *Colloquium heptaplomeres*, and *Universae naturae theatrum*. It is also revealed in the *République* where the question of religion is discussed within the context of his views on sovereignty and the significance of political stability in the state.

The *Colloquium heptaplomeres de rerum sublimium arcanis abditis* (*Colloquium of the Seven about Secrets of the Sublime*) is believed to have been written by Bodin during the 1580s, but it was not published until 1857 even though numerous copies of the book circulated in manuscript. Even though Bodin’s authorship of the book has been questioned, scholars in recent years have pointed more firmly to the validity of his authorship by drawing attention to the various connections it shares with other works he wrote, especially with the *Démonomanie* and *Universae naturae theatrum* (Kunz, “Introduction,” in Bodin 2008).

Perhaps the reason why Bodin did not publish this text during his lifetime may be found in the awareness of how deeply radical and unorthodox many of his contemporaries would consider the idea of religious tolerance that he introduced in the *Colloquium heptaplomeres*. As has been suggested, Bodin never had the intention to publish this text “because he knew his age too well.” The work, according to this interpretation, may be

considered as his “religious testament for a later age, which he worked out only for this inner satisfaction.” Another view expressed more recently is that Bodin must have intended to publish the *Colloquium heptaplomeres* and would have done so if he had lived longer, as this text provides the key to great part of his work and especially to the *Démonomanie* and *Universae naturae theatrum* (Kuntz, “Introduction,” in Bodin 2008, xxxviii).

The *Colloquium heptaplomeres* – a work that has been considered as one of the earliest texts of comparative religion – provides a dialogue among a group of guests who have met in the home of a man called Paulus Coronaeus in Venice. The seven men who take part in this discussion all represent different faiths or religious beliefs. Besides the host who is a Catholic, the participants include Salomon Barcassius, a Jew; Diegus Toralba, a natural philosopher; Fridericus Podamicus, a Lutheran; Antonius Curtius, a Calvinist; Hieronymus Senamus, a Skeptic; and Octavius Fagnola, a convert from the Catholic faith to Islam. During the dialogue, each man provides his views on the various points discussed.

The question of true religion is of central significance in the text, and it is introduced from the very beginning through a story narrated by Octavius in Book 1. The story concerns a sea voyage Octavius has once embarked on, during which the ship was cast in the middle of a terrible tempest. Terrified by the dangerous situation, the captain urged all aboard to pray to God – and so they did, though as crewmen and travelers were a diverse group of people who came from many different places and had different faiths, each man prayed to the God he believed in. When Octavius finishes the story and describes how the ship eventually arrived safely to port, Coronaeus raises a series of questions the last one of which is perhaps the most central: “with such a variety of religions represented, whose prayers did God heed in bringing the ship safely into port?” (Bodin 2008, 14). The complexity of this as well as the other questions raised here by Coronaeus is marked by the silence of all his interlocutors who are unable to respond on the spot. Yet, Coronaeus’s questions are set as topics for discussion for their following

meetings. Thus, the question of which religion is the true one becomes one of their central points of consideration and special emphasis to it is given in the last three books of the *Colloquium*.

No doubt, Bodin’s engagement with this question in this work had special currency within the historical context of the sixteenth century when Christianity itself was divided by intense religious conflicts (with the wars of religion in Bodin’s own country being a prime example), but also when Christian Europe came into contact (increasingly so through travel and exploration) with a diverse set of religious beliefs outside Christianity. Bodin’s response to the question of true religion involves the idea of religious tolerance: on the basis of this idea, it is possible to approach God through different religious paths as true religion basically involves the purging of the soul and its turning toward true God. These views in many ways express Bodin’s overall theorization of the relation between God and the universe: for him, the unity of God is reflected in the harmony of nature and “the nature of true religion . . . reveals and accepts the multiplicity of ways to approach God and the multiple revelations of God to man. True religion is tolerant, for it sees the harmonious multiplicity of religions. No religion is true whose point of view is not universal, whose expression is not free, and whose center does not reflect the intimate harmony of God and nature” (Kuntz, “Introduction,” in Bodin 2008, xliii).

A number of scholars have tried to provide an answer as to which speaker in the *Colloquium heptaplomeres* may be said to represent Bodin’s own religious beliefs. In response to this debate, Marion Leathers Kuntz has aptly remarked that it is perhaps “nearer to the truth . . . that all the speakers represent Bodin’s thinking at one time or another. No one represents his thinking exclusively, but Bodin is sympathetic to some views of each as the dialogue develops. The point seems to be, however, that regardless of Bodin’s approval or disapproval of the religious views represented in the dialogue, he constantly stresses the need for toleration of all religions” (Kuntz, “Introduction,” in Bodin 2008, xliiv).

An attempt to define Bodin’s personal views on religion suggests that these actually fluctuated

during the course of his life and, as Kuntz has argued, they became increasingly more liberal as he grew older and developed as a thinker. Thus, in his *Discours au senat et au peuple de Toulouse* in 1559, he held that “people should be brought up publically in one religion” and gave emphasis to the element of religious unity as a means of preserving the unity and cohesiveness of the state (Kuntz, “Introduction,” in Bodin 2008, xliii). This is a position that is also reflected in his discussion of religion in the *République* (1576) that emphasizes the significance of political stability and the unity of the state. In the years that followed, according to Kuntz, Bodin’s “liberal views became even more apparent, until they reach a climax in the *Colloquium heptaplomeres*, in which his religious opinions seem to have developed into a kind of theism which leaves each man’s religion, provided he has some, to his own personal conscience” (Kuntz, “Introduction,” in Bodin 2008, xliv). In this respect, Bodin advanced a view of true religion as a profoundly personal matter that did not necessarily require commitment to any particular church or established religion. This highly unorthodox for the standards of the sixteenth century view on religion must have been one of the elements that served to put Bodin under suspicion of heresy at different points in his life: he was suspected not only of being a heretical Catholic, but also of being a Calvinist and a Jew. Besides these, he was also considered by some as an atheist, though his writings clearly express the view that atheism is utterly unacceptable and intolerable. This is an idea that is consistently expressed in his writings throughout his career: most explicitly in the *République*, the *Démonomanie*, the *Colloquium heptaplomeres*, and *Universae naturae theatrum*.

Bodin on Natural Philosophy: The *Universae Naturae Theatrum*

Bodin’s engagement with natural philosophy and his systematic exposition of his views on the universe culminated with the writing of *Universae naturae theatrum* (*The Theatre of Universal Nature*). This work of natural philosophy, which

was published in the year of Bodin’s death in 1596, is also a continuation of his attempt to understand the relation between God and the universe, as “the main theme of the *Theatrum* is that God can best be known from the theater of universal nature” (Kuntz, “Introduction,” in Bodin 2008, xl). In his preface to the *Theatrum*, Bodin refers to the reasons why one has to turn to an examination of nature in order to better understand God. Marion Leathers Kuntz outlines these reasons: “man’s laws are often irrational and full of error, but the laws of nature are logical and fixed, for God himself is the author. The contemplation of nature is of prime importance, for it often leads a man to thoughts of God” (Kuntz, “Introduction,” Bodin 2008, xxx). Thus, as Bodin points out:

the Theater of Nature is nothing other than the contemplation of those things founded by the immortal God as if a certain tablet were placed under the eyes of every single one so that we may embrace and love the majesty of that very author, his goodness, wisdom, and remarkable care in the greatest matters, in moderate affairs, in matters of least importance. For as Aristotle writes, the one who doubts whether there is God or not must be refuted by no weak arguments. (as quoted in Bodin 2008, xxx).

The *Theatrum*, which is divided in five books, is written in the form of a dialogue between two figures, Theorus and Mystagogus. The first book concentrates on proving that nature is governed by a single principle and that is God who also created the world. This book also analyzes the form and causes of nature and things therein, as well as the processes of generation, movement, growth, and decay. The second book examines various natural elements, such as rocks, meteors, metals, and minerals. The third one concentrates on plants and animals, while the fourth focuses on the world of spirits (Bodin’s discussion of the soul may also be found here). The fifth and final book examines the planetary system, with Bodin being dismissive of Copernicus’s notion of a heliocentric system.

As has been pointed out, one of Bodin’s main purposes in the *Theatrum* was to refute various ideas found in ancient philosophy, one of those being the Aristotelian notion concerning the

eternity of the world (Blair 1997). According to Bodin, the world cannot be eternal because it was created based on the voluntary decision and free will of God, whereas eternal things have no first cause and their existence cannot be the product of another's free will or decision. Unlike the world he made, God alone is infinite and eternal. God is therefore described as the prime mover of the universe, the principle which is eternal and singular, as nothing can be like it or equal to it. As the principle, that is, God cannot be compared to anything else; it can also not be understood in comparison to anything else. Therefore, human beings that are finite cannot comprehend God and can never get a full grasp of his infinite mind. On this basis, human beings may question various dire happenings they see around them, but they should always have in mind that the world is governed based on divine providence and, even though they may not be able to understand it, God always purposes their welfare. Further, God made all things in the world good and, in this respect, evil is merely the lack of good.

As has also been suggested, perhaps "Bodin's most noteworthy innovation" in the *Theatrum* may be found in his treatment of the soul (Blair 1997, 137). This significantly departs from other treatments of the soul as it advances the largely unorthodox view that the soul is immortal but also corporeal. According to this theory, the soul is corporeal, even though the body it has is not material but spiritual, and separable from the corporeal body of the flesh. Thus, the human soul is presented as an intermediate form, a form that stands somewhere in between the following two extremes: that of form that is completely disembodied and separated from matter (as in the case of angels and demons) and that of form that is completely concrete and cannot be separated from matter, like the natural bodies of human beings. On the basis of this analysis, spirits (angels as well as demons) are corporeal beings, even though their bodies are purely spiritual and separated from matter – and the body of the soul is akin to the body of these forms, even though it is not always separated from matter.

Of course, Bodin's concept of the corporeality of the soul has an important set of political

implications that may be read within the broader context of his political ideas: i.e., if human souls were considered as incorporeal, it would be difficult to define how rewards and punishments could be distributed after death. And yet, belief in such distribution might contribute to the preservation of social order and political stability, elements that are central in Bodin's political thought. However, his highly unorthodox views on the corporeality of the human souls as well as spirits met with the condemnation of the Catholic Church. Indeed, quite ironically, despite its repeated references to the figure of God and his role as the creator and prime mover of the world, the publication of the *Theatrum* served to spark afresh the accusations of atheism that had previously been launched against Bodin (especially after the publication of the *Colloquium heptaplomeres*).

The *Theatrum* was published in French translation in the year following Bodin's death, in 1597, but it has never been made available in English translation. Despite the work's great ambition and the fact that it provides the culmination of Bodin's thought on the relation between things human and divine, the *Theatrum* largely remains the least celebrated and least studied of Bodin's major works in our days – though the publication of Ann Blair's excellent study (*The Theater of Nature*) in 1997 somehow served to make amends for the broader scholarly neglect.

Impact and Legacy

As one of Bodin's twentieth-century readers once remarked, Bodin may be considered as "the Aristotle, the Montesquieu of the sixteenth century" (qtd. in Lloyd 2013, 2). His impact during his lifetime is perhaps best testified by the comment of his contemporary writer Gabriel Harvey that "you cannot stepp into a scholars studye but (ten to one) you shall litely find open either Bodin *De republica* or Le Royes Exposition upon Aristotles Politique Discourses" (qtd. in Lloyd 2013, 2). As Harvey's observation suggests, Bodin's significant impact was largely based on the wide circulation of the *République* that was edited at least twenty-four times by 1600 and was translated into

various other languages – including a Latin translation by Bodin himself, published in 1586 with extensive revisions – that made the work more broadly available to audiences across Europe. Among the rest of Bodin's works – besides the *République* – the *Methodus* and the *Démonomanie* were those that enjoyed greater circulation in the years that followed their publication and may therefore be assumed to have been read more widely. For this reason, Howell A. Lloyd's recent edition of an illuminating collection of essays on *The Reception of Bodin* concentrates on these three works.

As Lloyd notes in his "Introduction" to this volume, Bodin's immediate contemporaries in France were relatively slow in their response to his writings. Of course, the reception of his works by his fellow countrymen was unavoidably shaped by the social, political, and intellectual context of his time – especially by the political and ideological controversies that marked the French civil wars – with "opinion agitated often to the point of frenzy and yet already coloured with the rudiments and certainly the terminology of some of his leading ideas" (Lloyd 2013, 11). Within this context, Bodin's works received an often contradictory set of responses and interpretations. This varied reception is testified by the different interpretations given to his theory of sovereignty that ultimately came to be used by royalists and monarchomachs – i.e., those who opposed monarchy and the power of kings – alike to support their widely contrasting views on this issue. More broadly, the views on Bodin's scholarly contribution ranged from sharply negative and critical ones to others that were more approbatory or laudatory. Thus, while some of his contemporaries in France doubted his reliability as a scholar and accused him of plagiarism (a charge that pursued Bodin throughout his life), many others expressed admiration for his works – including Michelle de Montaigne whose essays suggest his debt to Bodin's thinking (Lloyd 2013, 15–16). As it appears, Bodin's contribution to the theory of sovereignty was duly recognized in France in the years after his death when his formulation of sovereignty had a significant impact within the absolutist movement. French

thinkers who engaged with his ideas in the seventeenth century include Charles Loyseau (1564–1627), Cardinal Richelieu (1585–1642), and Gabriel Naudé (1600–1653). Thus, "Bodin's critics notwithstanding," the decades after his death "manifested as lively a reception at least of his masterpiece as that which Gabriel Harvey had observed in Elizabethan England half a century before" (Lloyd 2013, 17).

Of course, as Lloyd aptly reminds us, "the reception of Bodin was not just a French, but a Europe-wide phenomenon" as his ideas had an impact well beyond France to various other countries, such as England, Germany, Italy, Spain, and the Netherlands (Lloyd 2013, 17). For example, the German jurist Johannes Althusius (1557–1638) employed Bodin's theory of sovereignty in his treatise *Politica methodice digesta* (1603) to suggest that sovereignty always belongs to the community – an argument that was used in this text to justify the Dutch revolt. Further, the Italian thinker Giovanni Botero (1544–1617) appears to have been influenced by Bodin in his treatment of the concept of "reason of state" (in French, *raison d'état*) in his *Della ragion di Stato* (1589), while a number of references to Bodin were also made by the Dutch jurist Hugo Grotius (1583–1645) in his *De jure belli ac pacis* (1625). In England (where the idea of sovereignty came under increasing debate, especially within the context of the civil war in the mid-seventeenth century), Bodin's ideas had a significant impact on Sir Robert Filmer (1588–1653) who often cites the French jurist in advancing his theory of monarchy as an absolute and divinely sanctioned type of power in his book *Patriarcha* (1680). John Locke's (1632–1704) refutation of Filmer's arguments in his *Two Treatises of Government* (1689) may thereby be seen to provide also a response to Bodin's theory of sovereignty. Another important English philosopher who appears to have been influenced by Bodin is Thomas Hobbes (1588–1679). Hobbes's affinity with Bodin may best be seen in his treatment of sovereignty as an indivisible form of power, an idea that is expressed by Hobbes in such works as his *The Elements of Law* (1640), *De cive* (1642), and *Leviathan* (1651).

Boethius, Anicius Manlius Severinus

Born: 475–7

Died: Around 526

Dario Brancato

Department of Classics, Modern Languages and Linguistics, Concordia University, Montreal, QC, Canada

Abstract

Boethius was one of the most studied philosophers in the Middle Ages. His definition of *quadrivium*, his translations of Aristotle's *Logic*, and above all his *The Consolation of Philosophy* define medieval culture long before the Arabic transmission of ancient texts. In the Renaissance, the popularity of Boethius did not diminish, but there was a shift in the type of scholarship applied to his works: on the one hand, sixteenth-century translations of Aristotle's logical works competed with those by Boethius; on the other hand, the *Consolatio* was progressively placed within the larger context of transmission of ancient philosophy that emphasized its pagan content.

Biography

Anicius Manlius Severinus Boethius was born in Rome, probably around 457–7. As a member of the very powerful *gens Anicia*, he spent all his mature life serving under the Ostrogoth king Theoderic the Great. Little is known about his education: after his father's death, he was adopted by senator Quintus Aurelius Symmachus, a lover of philosophy and literature; Boethius then became well-versed with the Greek philosophy of Plato and Aristotle, filtered through later interpretations, most notably the Neoplatonic tradition. He did not study in Athens or Alexandria, where the last two Platonic philosophical schools were (Marenbon 2003, pp. 12–13); his knowledge of Neoplatonism is likely to have occurred through Greek authors who lived between the third and fifth centuries (Ammonius, Proclus) or even Latin authors (Macrobius, Marius Victorinus, Apuleius; Moerschini 2014, pp. 92–131). His intellectual project was to offer a Latin translation of all the works of Plato and Aristotle, but it was never completed: he only managed to render into Latin Aristotle's *Organon* (Marenbon 2003, pp. 17–42; Moerschini 2014, pp. 9–34). He also wrote influential commentaries on Aristotle's *Logic*, on Porphyry's *Isagoge* (*Introduction to Aristotle's logic*), and on Cicero's *Topics*, as well as original works on logic, arithmetic, music, geometry, and Christian theology. Under king Theoderic, Boethius had a brilliant career: he was appointed consul in 510, and in 522 he served as *magister officiorum*, a very prestigious position, whereby he oversaw other senior officials at the royal court (Galonier 2007, pp. 55–60). This appointment most likely caused Boethius' fall from Theoderic's grace: accused of treason in 523, he was detained for a short time in Pavia and then executed in a hitherto unidentified location (referred to as *In agro Calventiano*) in 524 or 526 (Galonier 2007, p. 93; Marenbon 2003, p. 10). Before his death, he was able to complete his most famous work, *The Consolation of Philosophy* (*De consolazione Philosophiae*, henceforth *Consolatio*), a dialogue between the author and a lady representing philosophy, which adopts the form of prosimetrum (mixing

prose and poetry). The *Consolatio* contains traces of both pagan and Christian religious traditions. However, Boethius, like most Roman aristocrats of the time, was not a pagan but a Christian, which is reflected in his *Opuscula sacra*, a collection of seven short treatises on a theological dispute between Catholicism and various forms of heterodoxy (including Arianism; Moreschini 2014, pp. 35–91).

Heritage and Rupture with the Tradition

Boethius represents a pivotal author in the transition between classical and medieval culture. His works on the *quadrivium* (which includes *De arithmetica*, *De musica*, and the lost translations of Euclid's geometry and Ptolemy's astronomy) determined the educational model adopted by medieval schools and universities; his translations of and commentaries on Aristotle's logical works, which also included the ubiquitous *Isagoge* of Porphyry, remained the standard Latin versions in the university curriculum well beyond the Middle Ages. Above all, his *Consolatio* was deemed an important source of information for ancient culture and philosophy, and it also became a standard textbook to learn Latin. Until at least the middle of the thirteenth century, the *Consolatio* was a prescribed text in the university curriculum for ethics and was read along Plato's *Timaeus* and part of Aristotle's *Nicomachean Ethics* (Lafleur and Carrier 2004). In this context, the *Consolatio* was also one of the few texts available to the medieval reader where Platonic themes could be found (Courcelle 1967, pp. 161–176, 203–238; Nauta 1993), and medieval commentators rightly recognized the links between some passages of the *Consolatio* and Plato's *Timaeus* (one of the few dialogues available in Latin). Several traits of continuity with the Middle Ages characterize the reception of Boethius in the Renaissance. The most relevant two are, first, the sustained popularity of the *Consolatio* and of the Boethian translations of Aristotle's *Organon*, even after the revival of Greek sources in the fifteenth century and the dissemination of new, humanistic

translations of Aristotelian texts (Ashworth 1988), and, second, the fact that the *Consolatio* continued to be the object of scholastic commentaries well into the sixteenth century. Concerning this latter aspect, the most popular interpretation of the *Consolatio* was a fifteenth-century commentary falsely attributed to Thomas Aquinas, which displayed many similarities with that by the fourteenth-century Nicholas Trevet (Courcelle 1967, pp. 318–319; Nauta 1997).

Signs of rupture with the medieval tradition appeared in the fifteenth century, when Italian humanist Lorenzo Valla criticized the style of Boethius' translations as well as the philosophical content of the *Consolatio*. In Valla's view, Boethius was guilty of using logic instead of faith to address theological problems to the point of being un-Christian (Nauta 2003; Brancato 2012, pp. 372–377). As a result, even though Boethius' translations of Aristotle remained central to scholastic philosophy, there appeared new, humanistic versions which competed with those of Boethius.

Innovative and Original Aspects

New commentaries on the *Consolatio* reflect the various directions taken by Boethian scholarship: in the 1400s, Denys the Carthusian gave a mystical reading of the *Consolatio* filtered through Scripture and the Church Fathers emphasizing its spiritual aspects (Macken 1984). With the revival of Plato in the fifteenth century, commentators started to recognize more fully the links between the *Consolatio* and Plato's *Timaeus*, a link that had already been noticed in the Middle Ages, but not fully developed for lack of sources. With the recovery of Neoplatonic commentaries on the *Timaeus*, some interpreters, such as Florentine philosopher Francesco Cattani da Diacceto (1466–1522), gave a distinctly Neoplatonic reading of the *Consolatio* and emphasized its pagan elements (Brancato and Vanhaelen 2015); in 1514 Dutch humanists Rodolphus Agricola and Johannes Murmellius published a commentary for school

use that put the emphasis on the linguistic and philological features of the work and aimed at perfecting students' knowledge of the Latin language (Nauta 1999; Goris and Nauta 1999). Two further lines of investigation were developed in the seventeenth century by Theodor Sitzmann and René Vallin, whose commentaries on the *Consolatio* underlined points of similarity between the *Consolatio* and other ancient traditions, such as Stoicism and Pythagorism. Finally, Jan Bernaerts (1607) and Pieter Bert (1620), both personal friends of Justus Lipsius, read the *Consolatio* as a text that combined Christian and Stoic elements, in the wake of Lipsius' *De Constantia* (Belli 2011, pp. 200–233).

Impact and Legacy

Given the vast popularity of the *Consolatio*, it is hard to overstate its impact on Western thought and literature. To some extent the readership of Boethius' *Consolatio* in the fifteenth and sixteenth centuries remained comparable to that of the preceding century: the text was still used in the classroom by both intermediate and advanced students of Latin (Black 2000, p. 32). As in the Middle Ages, the *Consolatio* was also read as a philosophical text connected with the cosmology of Plato's *Timaeus*; however, the revival of previously unknown Greek traditions (Neoplatonism, Stoicism, Pythagoreanism) also created new opportunities to interpret the *Consolatio*. The focus on ancient philosophical sources in the *Consolatio*, combined with the lack of any reference to Christianity, led nineteenth-century scholars to believe that Boethius was pagan (Nauta 2010, p. 133). This belief continued to a certain extent even after the discovery of the so-called *Anecdota Holderi* (1877) a fragment from a work by Cassiodorus (sixth century) confirming that Boethius was, in fact, the author of the *Opuscula sacra* (Moreschini 2014, pp. 30–32).

In addition, the *Consolatio* quickly became a canonical work and a model: many authors, such as Dante, Chaucer, and Christine de Pizan

(Lombardo 2013; Minnis and Machan 1993; Cropp 1981), imitated its prosimetric structure and philosophical content (fortune, human happiness, evil, free will, divine foreknowledge).

Throughout the Middle Ages and the Renaissance, many vernacular versions of the *Consolatio* appeared in Italian, Spanish, Catalan, French, German, Dutch, and English (Albesano 2006, pp. 38–53; Goris 2000; Goris and Wissink 1997; Rädle and Worstbrock 1978; Johnson 1997). These were generally used for the purpose of moral edification or to learn Latin through the practice of translation, but they were also central to the creation of a new vernacular culture. For instance, the Italian translation of the *Consolatio* by sixteenth-century Florentine intellectual Benedetto Varchi was a highly sophisticated linguistic experiment used to develop the vernacular into a literary and philosophical language comparable to ancient Greek and Latin (Brancato 2018, pp. 67–86).

As for Boethius' Aristotelian translations, his version (*textus antiquus*) of Aristotle's logical works was still printed well into the half of the sixteenth century (Ashworth 2008, pp. 611–618): for the most part, and despite the humanistic call for a return to the Greek Aristotle, Renaissance logicians and Aristotelian commentators continued to refer to the *textus antiquus* instead of relying on more recent translations: for instance, the 1552 Giunta edition of Aristotle and Averroes still relies on Boethius' translation of Aristotle's *Categories* and *On interpretation* and Porphyry's *Isagoge* (but his translation of *Prior Analytics* is discarded in favor of that by Girolamo Bagolino). Another common practice that developed in the fifteenth century was to correct Boethius' version through comparison with the Greek original (Minio-Paluello 1961, pp. XXXIX–XLIII, 1962, pp. XLV–LI).

Böhme, Jacob

Born: 1575

Died: 1624

Cecilia Muratori

University of Warwick, Coventry, UK

Abstract

Jacob Böhme was one of the most influential philosophers of post-Reformation Germany. During his lifetime, only one short book was published out of his vast body of works (*Der Weg zu Christo* 1624). The unfinished manuscript of his first book, *Aurora*, was confiscated in 1613, due to accusations of fanaticism and heresy. From 1619 to his death in 1624, he wrote extensively, and the works circulated thanks to a growing network of followers. According to Böhme, all of his works derived from a revelation or insight that allowed him to understand the “whole Being in evil and good.” The central idea in Böhme’s philosophy is the interaction of positivity and negativity, light and darkness, “yes” and “no,” in the Divine as well as in nature, in which the Divine reflects itself. Böhme follows in the tradition of German mysticism in conceiving the Divine both as abyssal depth (which he calls *Ungrund*) and as God the creator. But he combines this theological approach with a strong interest in natural philosophy, giving shape to a comprehensive philosophical approach that aimed to explain the role and origin of evil within the Divine and in the creation, the processes of growth, and decay in nature, as well as the position of the human being in the universe, and the way to salvation. Böhme’s philosophy enjoyed a remarkable international reception, as several of his works were translated into English, Latin, French, and Dutch. In Germany, he became a reference point for many eighteenth- and nineteenth-century readers, most notably F.W.J. Schelling and G.W.F. Hegel.

Biography and Legacy

In his *Lectures on the History of Philosophy*, G.W.F. Hegel (1770–1831) named Böhme the “first German philosopher,” a surprising statement for contemporary readers, since Jacob Böhme’s place in the history of philosophy has been almost forgotten since Hegel’s time. Born in 1575 in the village of Alt-Seidenberg, in Upper Lusatia, Böhme is the prolific author of around 30 works, ranging in topics from natural philosophy to the question of religious salvation, and in format from extensive theological discussions to short polemical replies to his critics. Only one book, containing two short texts and titled *Der Weg zu Christo*, was published during his lifetime, in the year of his death, 1624. All others circulated merely in manuscript form, copied, and diffused thanks to an extensive network of friends and supporters (Penman 2014). Yet, Böhme played a major role in shaping post-Reformation German philosophy, and his international reception was remarkable: by the 1660s his complete works had been translated into English, and the first complete German edition followed 20 years later, in 1682. By 1741, the name of Böhme had become famous and the Church historian Johann Lorenz Mosheim could declare that Böhme’s works were “in everybody’s hands” (Mosheim 1741, 611). By the time Hegel held his lectures on the history of philosophy, readers of Böhme included Franz von Baader (1765–1841), F.W.J. Schelling (1775–1854), and Arthur Schopenhauer (1788–1860), among others.

Despite the popularity of Böhme’s works, information about his biography has long remained incomplete. This is one of many paradoxes in the reception of Böhme: he has been simultaneously well known and yet an almost mythical figure, often treated in ahistorical terms. Indeed, his books might have been “in everybody’s hands,” and his name famous, yet the number of actual readers is likely to have been more limited than Mosheim implies. This is due to the fact that information about Böhme’s

life and writing career was transmitted largely by a biography composed by Abraham von Franckenberg (1593–1652), which was published in the main editions of Böhme's collected works (Gilly 2007). The biography narrates several magical, prophetic, and visionary episodes, even if Böhme never reports having experienced visions or presages (Koyré 1929, 17). The popular portrait of Böhme as a mystical cobbler – a profession he practiced for some years – thus derives mostly from the biography, rather than from Böhme's work (Muratori 2012).

In the mid-nineteenth century, the historian Hermann Fechner claimed that the lack of information about Böhme's life derived from the fact that, like all mystics, he conducted a life removed from the events of the outer world (Fechner 1857, 313). This view certainly does not stand up to textual scrutiny. One of the main sources for Böhme's life is his correspondence, in which he often discusses political events as well as the genesis, circulation, and reception of his own works. The view of Böhme as a secluded mystic is misleading, but it is true that he is reticent about matters such as the sources and authors that might have inspired his writings. Böhme's education was most probably limited to attending the local school in his birthplace, Alt-Seidenberg, not far from the nearby city of Görlitz, which was at the time no provincial backwater and had had a *Gymnasium* since 1565. Böhme often remarks on his lack of education as a way of emphasizing that the source of his knowledge was not to be found in books, thus portraying himself as a “philosopher of the simple people” (*Aurora* 18.80), close to the tradition of the Old Testament prophets (Benz 1959).

By 1592 he moved to Görlitz, where in 1599 he acquired a cobbler's shop. In the same year, he married Katharina Kuntzschmann, daughter of a butcher, and their first son, Jacob, was born in 1600. The profession of shoemaker was to become a symbol of Böhme's distance from the learned world, and his familiarity with the cobbler's tools the explanation for the lack of formal elegance in his German prose. Given the fact that Jacob Böhme was a common name, “the cobbler Böhme” was often used in the city's documents to

distinguish him from namesakes (Lemper 1976, 55). The “cobbler from Görlitz” has remained the most popular label for Böhme, underlining his lack of formal training in philosophy and theology.

In 1612, Böhme wrote his first book, *Morgenröte im Aufgang*, also known as *Aurora*. As with all subsequent works, the Latin titles were not added by Böhme himself, even if, as in the case of *Morgenröte/Aurora*, or the later *Von der Geburt und Bezeichnung aller Wesen/De signatura rerum*, the Latinized version was often more successful than the original one. In a letter, Böhme explains that the writing of *Aurora* was the result of an insight, or intuition, he had experienced 12 years previously. He describes it as a “fiery drive,” “violent impulse of the spirit” (*Sendbrief* 10.3) that practically forced him to pen his intuition in his first book. In his biography, Franckenberg claimed that the catalyst had been a glimpse of a metallic container, through which Böhme was “seized by divine light” (*Bericht*, 10). Böhme himself describes the intuition as the opening of a gate, which allowed him to “see and know more in a quarter of an hour” than if he had “at distinguished schools” (*Sendbrief* 12.7). He claims that he saw and understood the “whole Being in evil and good” (*Sendbrief* 12.8): indeed, the presence of opposites in everything – in nature as well as in the divine – is, as Hegel recognized, a foundational idea of Böhme's philosophy.

The following year, 1613, a copy of *Aurora* came to the attention of the town's magistrates. A key role was played by the *primarius* of Görlitz, Gregorius Richter (1560–1624), who soon afterwards preached a sermon in which he accused Böhme of spreading fanatical ideas. The manuscript of *Aurora* was confiscated, and Böhme was issued with a warning not to write anymore. From 1612 until 1618, he obeyed this prohibition, even if in the correspondence he clearly describes it as a form of persecution (*Sendbrief* 10.5). It seems plausible that the outbreak of the Thirty Years' War in 1618 was a major event that prompted Böhme to start writing again, as the desire to give voice to and spread the content of his insight were made stronger by the sense of emergency caused by political and religious conflict. In 1619,

he completed his second book, which differs greatly from the first: whereas *Aurora* had remained incomplete (on the reasons see Koyré 1929, 76, and the introduction to Böhme 2008), *Beschreibung der drey Principien Göttliches Wesens* is a voluminous work whose title alludes to the three substances of Paracelsus—salt, mercury, and sulfur. Indeed it is likely that between 1612 and 1618, Böhme increasingly came into contact with Paracelsian, or Paracelsian-inspired, natural philosophy, especially through an increasing network of followers, including figures such as the physician Balthasar Walther (1558–1631).

The extant correspondence provides evidence for how Böhme's life and writing career unfolded from 1619 onwards. Having sold his cobbler's shop, he turned to selling goods such as gloves, an occupation that led him to travel as far as Prague. There, in 1619, Böhme witnessed the Elector Friedrich V of the Palatinate entering the city. From 1619 to the year of his death, Böhme rapidly composed an astonishing number of writings. As he explains in a letter, with each of them he felt that he moved closer to revealing the secrets of which he had intuition, but which he could not clearly express at the beginning of his writing career. In fact, he admits that in *Aurora* "the great mysteries" had been expounded in too simplistic a way, and with many faults (*Sendbrief* 10.4). Yet despite the differences in style and content, he claims that all his books derive from the initial impulse to bring to expression his fundamental insight.

The publication in Görlitz of *Der Weg zu Christo* in 1624 triggered a second phase of accusations against Böhme. Once again, Gregor Richter was vocal in his opposition, which this time included the publication of a pamphlet ridiculing the "cobbler" for having stepped beyond the proverbial limits of his profession: *ne sutor ultra crepidam!* (Richter 1624). Yet Böhme succeeded in defending himself by claiming authorship of the work, but dismissing insinuations that he planned its publication, which instead had been arranged by the nobleman Hans Sigmund von Schweinichen. In 1624, Böhme was invited to Dresden, to discuss his views at court. The exact nature of this meeting is uncertain: it may have

been more inquisitorial in nature than Böhme admits in his correspondence. While in Dresden, Böhme was hosted by Benedikt Hinckelmann (1588–1659), who directed the local court laboratory. Having returned to Görlitz, Böhme died of an unknown illness in November 1624. According to Franckenberg's biography, he told one of his children that he heard music when death was near (*Bericht* 21). He was buried in the churchyard of the Nikolaikirche in Görlitz.

After his death, efforts were made by his friends and followers to collect existing manuscripts and place them in the hands of the Dutch merchant Abraham Willemsz van Beyerland in Amsterdam (1587–1648) (van Ingen 1984, 12–16). The manuscripts served for van Beyerland's own translations of Böhme into Dutch and also became the foundation for the first edition of Böhme's collected works (Amsterdam 1682), under the direction of Johann Georg Gichtel (1638–1710). A second edition, in two volumes, was printed in 1715, and a third, edited under the direction of Johann Wilhelm Ueberfeld (1659–1732), in 1730. The latter is still the standard edition today, but a few autographs have since been rediscovered, including the manuscript of *Aurora* that had been confiscated in 1613 (see Böhme 1963/1966).

Böhme's reception was heavily influenced by the way in which his manuscripts circulated, were translated and published. The European diffusion of Böhme was thus varied, involving in the years following Böhme's death especially Holland and England. Thanks to the availability of translations, England became a main catalyst of Böhme's thought: famous readers of Böhme included William Blake (1757–1827), who considered Böhme "divinely inspired" (Foster Damon 1988, 39). Samuel Taylor Coleridge wrote extensive marginalia to Böhme, in which he praised the shoemaker's "superior insight," especially with regard to the conception of the Divine (Coleridge 1980, 597). In Germany, Böhme's ideas became shaping impulses for several doctrines within the religious current of German Pietism (Martin 2014). Philosophical interest in Böhme increased in particular after the publication of the 1715 and 1730 German editions of

Böhme's works. The Jena Romantics, and especially Ludwig Tieck (1773–1853) and Friedrich Schlegel (1772–1829), integrated Böhme within the development of Romantic *Poesie* (Mayer 1999). A more comprehensive interpretation of Böhme, based on the study of the texts, was provided by Hegel and Schelling, though their readings emphasize different aspects of Böhme's philosophy (Muratori 2016; Brown 1977; Bianchi 2016). The reception in France had a more theosophical, mystical character, especially through Louis-Claude de Saint-Martin (1743–1803), known by the epithet of "Philosophe inconnu," who translated Böhme into French. Reception in areas such as Italy and Spain was probably less significant, but this is a topic that still awaits research.

Böhme's Philosophy (Original Aspects; Heritage and Rupture with the Tradition)

"There is nothing in nature in which good and evil are not present" (*Aurora* 2.5): according to Böhme everything that is alive must contain in itself a duality, because it is from the contrast of polar opposites that all movement is generated, and life consists essentially in movement. In *Aurora*, Böhme introduces the concept of "quality" in order to account for the internal vitality of nature: a quality is the "mobility, springing, or urging of a thing" (*Aurora* 1.3), a definition that relies on an original interpretation of the word *Qualität*. Böhme often uses the sound and spelling of a word to convey a philosophical interpretation: in this case, a *Qualität* is something that springs (*quellen/quallen*), but also has within itself a root of negativity, that is to say a "torment" (*Qual*) (Koyré 1929, 88; Weeks 1999, 65). The meaning of the word is thus inscribed in its letters, but it requires a particular insight to understand what Böhme calls "the language of nature" (*Natursprache*). At the level of the language of nature, words and essences are said to be in perfect harmony, just as was the case with the language spoken by Adam in the Garden of Eden. But in post-Babel languages, the true meanings are hidden within the words and need to be

expounded by someone, like Böhme, capable of tapping into language of nature through a spoken language like German.

A "quality" is for Böhme a model of internal opposition that he applies, in various complex formulations, to the explanation of the entire creation. Starting from two main qualities, a good and an evil one, he develops throughout his work several lists of qualities, whereby each gives rise to the next one in a cycle. In *Aurora*, the life cycle of growth and decay is explained by reference to a bitter quality (the "heart in all life"), which prompts the opposition of the sweet quality, and from the sweet to the sour and the stringent one (*Aurora* 1.19–24).

In parallel to the term "quality," Böhme also refers to opposing "wills" (*Willen*), or also forms (*Gestalten*). In *De signatura rerum*, he explains for instance that there are "seven forms in nature, both in the eternal and in the external" nature (*De signatura rerum* 9.8). This means that the cycle of forms, or qualities, is not restricted to the worldly manifestation, that is, to say in visible nature, but it also applies to "eternal nature," since "the eternal has also got its nature" (*Von der Menschwerdung Jesu Christi* I, 13.11; see also Koyré 1929, 354–356). Indeed, for Böhme nature and the divine are deeply connected, and understanding creation is even a path to grasping the nature of God: for this reason, Böhme calls nature his teacher, "Lehrmeister," guiding him in the discovery of the mysteries of creation. Using a common Renaissance metaphor, Böhme thus compares nature to a book, claiming that "you won't find any book in which you could better discover and investigate the Divine wisdom than when you walk on a green and blooming meadow; there you will see, smell and taste the marvellous power of God, even if this is just a similitude" (*Beschreibung der drey Principien Göttliches Wesens* 8.12). God himself inhabits nature (*Clavis* 25), even if Böhme does not adhere to a pantheistic view: rather, nature is God's tool (*Clavis* 24), and its mobility ultimately derives from God's will (*Vierzig Fragen von der Seele* 1.5–6).

The idea of an internal motion connects Böhme's views of nature and of God: "everything

exists in yes and no, be it divine, devilish or earthly” (*Betrachtung Göttlicher Offenbarung* 3.2). Within God, too, there is life-giving opposition, and a cyclical movement, due to seven spirits that together engender the movement that gives birth to the Son, rather than to natural things as in the outer manifestation of nature (*Aurora* 8.25). The number seven is of course redolent of Biblical references, but Böhme employs it to suggest that both in nature and in the divine there is a similar life cycle, linked by the existence of the same number of stages. Indeed Böhme states that “the being of all beings is one being only, and yet in its generation it divides itself two principles, that is in light and darkness, in joy and pain, in evil and good, in love and anger, in fire and light” (*De signatura rerum* 16.11).

The metaphor of light and fire, in particular, recurs throughout Böhme’s work to explain how the dynamics of separation apply also to the case of the divine itself. From the general point that “there is no light without fire, and no fire without serious torment [*Qual*],” Böhme explains that “in the fiery world” God is called “God’s anger, God’s wrath, since in this way God calls himself a devouring fire. But in the light world, that is to say in the Son of God, he is the flame of love” (*Von der Menschwerdung Jesu Christi* I, 3.10–14). The reference is to *Deuteronomy* 4:24 and 4:31, where God is called first a furious, devouring fire of God, and then a compassionate God. For Böhme, both sides are not only present, but even necessary for God to be alive in the generation of the Son. Yet in line with the tradition of German mysticism, and of Meister Eckhart (c. 1260–1328) in particular, Böhme distinguishes between the divine in the movement of generation, and as entirely separate from the creation. The latter, which Eckhart had called “divinity” (*Gottheit*), is in Böhme’s terminology *Ungrund* that which lacks a ground, or foundation: “In the eternity, that is to say, in the ungrounded beyond and without nature there is nothing but silence without being. [...] This same ungrounded is like an eye, since it is its own mirror. It doesn’t have a being, neither light nor darkness” (*Von der Menschwerdung Jesu Christi* II, 1.8). But the *Ungrund* is “an ungrounded eye that does not stand in anything nor does it see

anything” (*De signatura rerum* 3.2; see also Koyré 1929, 280–281).

A major philosophical issue for Böhme is that of explaining how these two different conceptions of the divine are at all combinable, since *Ungrund* remains immobile in eternity, and yet God generates his Son and creates the universe. He employs the metaphor of the mirror to explain what is not a transition in time, but a theological process (Koyré 1929, 288–290). In the mirror, the will of the *Ungrund* sees itself, and desire (*Begehren*) is generated through an act of contraction or pulling, which Böhme also calls *Scienz*, derived according to the language of nature from the verb *ziehen*, which means “to pull” (*Sendbrief* 41.6). In this way, a duality is created through the reflection in the mirror, and the immobile will of the *Ungrund* becomes internally separated and thus properly willing, since to will something implies a subject-object distinction, and thus a separation akin to the one necessary for any movement or life. The process of revelation of the immobile, divine depth through this act of self-inspection takes place through the “wisdom of God,” or “Sophia,” which plays the role of the mirror (see Benz 1937, 21–27; Koyré 1929, 212). The revelation in the wisdom of God “happened in eternity as in the figure of a virgin, who, however, does not give birth, but is a mirror of the divinity and eternity of *Grund* (ground) and *Ungrund* (ungrounded), an eye of the glory of God” (*Von der Menschwerdung Jesu Christi* I, 5.2).

With this conception of the internal separation of the divine, Böhme faces another difficulty: he must explain how it is possible that darkness is the origin of life, even in God, and yet maintain, as he does, that God is essentially love and light. Indeed, Böhme goes as far as understanding the personification of darkness, the fallen angel Lucifer, as in all respects as a child of God, and not an external and independent principle (as in the Manichean tradition). Furthermore, the creation of Adam is for Böhme a direct consequence of Lucifer’s Fall, “because the human being replaced Lucifer” (*Von der Menschwerdung Jesu Christi* I, 3.12), so that one could claim that the latter had been necessary and that God even planned to give rise to evil. As *Ungrund*, God is

“neither this nor that, neither evil nor good”, because it does not have “any distinctions within itself” (*Von der Gnadenwahl* 1.3). But good and evil are originated through separation, so their roots are arguably to be retraced back to this original process within the divine.

Böhme deals with this problem in most of his writings. In *Mysterium magnum*, he gives the following explanation: “If evil in the contrasting will were not useful, then God, as the only, eternal good, would not tolerate it, but would destroy it. But it serves the revelation of the glory of God and the reign of joy, and is an instrument of God, so that he can bring to expression its good, and that the good may be recognized. For if there were no evil, the good would not be recognized.” (*Mysterium magnum* 71.17). The necessity of evil does not imply that the human being does not have any power to choose between good and evil. On the contrary, Böhme conceives human life as a battlefield between good and evil, God and the Devil, and humans are called to side with one or the other. Ultimately, the aim is the rebirth of humankind (*Wiedergeburt*): “from God’s fire of anger the new human being must sprout anew [like a plant]” (*Von der Menschwerdung Jesu Christi* I, 12.22). Only at that stage will light prevail over darkness, but human beings must work towards this aim even while caught in the cycle of growth and decay in this world, between the opposing powers of light and darkness, God and his Enemy, the Devil.

Bolsec, Jérôme

Born: Unknown

Died: 1585

Graeme Murdock

Trinity College Dublin, Dublin, Ireland

Abstract

Jérôme Bolsec was a French Carmelite monk, reform-minded theologian, doctor, and Catholic polemicist. Bolsec's support for religious reform meant that he was forced to leave the French monarchy in 1545. Bolsec's conduct and his opinions about salvation theology led to a troubled relationship with other French reformers and with the authorities in Geneva

and in the Swiss lands. Bolsec eventually returned to loyalty to Rome and compiled a hostile and influential biography of John Calvin.

Biography

Jérôme Bolsec (b. unknown, Paris – d. 1585, Lyon) was a Carmelite monk whose preaching in favor of religious reform brought him to the attention of the French Catholic authorities. In 1545 Bolsec sought refuge at the court of Renée de France, the duchess of Ferrara. Bolsec got married, studied medicine, and then served as a doctor in a noble household near Geneva. In 1550 he moved to live in Geneva. Bolsec then openly challenged John Calvin's views about free will and salvation at a public meeting held in October 1551. Bolsec proposed that divine predestination was based upon God's election of those whom He foresaw would respond with faith to His love. For Calvin, the suggestion that human faith did not depend on divine election challenged God's sovereign authority. Calvin believed that Bolsec had perverted true doctrine and disturbed the peace of the Genevan church. Bolsec was arrested by the Genevan state authorities. After a hearing held by the city council, Bolsec's opinions were sent to the Swiss Reformed churches for comment. Despite a cautious response from the Bernese church in particular, the Genevan authorities proceeded to banish Bolsec from their territory in December 1551. Bolsec moved from Geneva to nearby Thonon (under Bernese control). After the Bernese introduced a ban on discussion of predestination, he was banished in March 1555. Bolsec returned to France and sought admission to the ministry of the Reformed church promising to subscribe to the church's confession. However, he was condemned by the national synod of the French Reformed church that was held at Lyon in 1563. Bolsec then moved to Lausanne (under Bernese control). When he refused to subscribe to the Confession of Bern, he was forced to return to France and was subsequently reconciled with the Catholic Church.

Bolsec published controversial biographies of Calvin in 1577 and of Theodore Beza in 1582.

Bolsec wrote his biography of Calvin (who had died in 1564) in response to the favorable version of Calvin's life first published by Beza in 1564. Bolsec departed from tradition in the genre of biography by composing a full-length, hostile account of Calvin's life and legacy. Bolsec placed Calvin in the tradition of arch-heretics, and his text combined stories based on his personal experience of Calvin alongside rumor and invention. Beza's biography had praised Calvin's pious marriage and austere lifestyle. Bolsec claimed that Calvin had been convicted of sodomy as a young man and suggested that Calvin made sexual advances on married women in Geneva under the guise of offering pastoral guidance. Beza's biography had emphasized Calvin's patient endurance of ill-health and his quiet and calm death. Bolsec presented Calvin's illnesses as a reflection of his immoral character and suggested that he died cursing his own ideas. Bolsec also completed a biography of Beza. This text was based upon a selection of hostile sources and stressed Beza's sexual depravity and heretical opinions. Bolsec also depicted Geneva as a licentious and decadent city that had turned its back on true religion. Bolsec's version of Calvin's character and life proved to be of long-lasting significance. It was published in a number of editions and was first translated into Latin in 1580, then into German in 1580, into Dutch in 1581, and into Polish in 1583, and remained a source of Catholic polemic against Calvin and Reformed religion through to an edition printed in 1875.

Hopkins University, Baltimore, MD, USA

Abstract

Ancient, medieval, and Renaissance philosophical texts were copied out and circulated widely in manuscript and print throughout the

mid- to late-fifteenth, sixteenth, and early seventeenth centuries. Ancient Greek and Latin philosophical works either “lost” or otherwise obscure during the Middle Ages – including much of the Platonic corpus and Lucretius’s *De rerum natura* – were rediscovered in European ecclesiastical libraries, widely copied, and circulated for the first time since the classical period. Other ancient Greek-language philosophical works traveled westward from Constantinople and the Levant, including the full corpus of Aristotle, known only partially to medieval Europe through imperfect Latin translations and commentaries. Renaissance interest in classical pagan philosophy hardly forestalled the continuing production in script and print of medieval Scholastic texts, however, which were still widely taught in the universities. The concomitant production, particularly of printed texts, by early modern schools of neo-Aristotelian thought, Pyrrhonian skepticism, and other strains of classically inspired philosophy, nonetheless, entered the mainstream of Renaissance discourse across Catholic and Protestant confessional lines.

Multiple extant medieval and Renaissance textual versions of ancient philosophical works were collated, transcribed, edited, glossed, translated, and circulated for the first time on a major scale as Renaissance humanists applied unprecedented standards of textual criticism and philological rigor to their work. Renaissance printers and publishers helped to revolutionize the physical presentation and duplicative power of textual production by moveable type in the service of commercial and intellectual interests. These processes aided in the consolidation of a historically sophisticated canon of premodern and early modern philosophical texts that are entirely recognizable to scholars today. The prevailing socioeconomic, legal, political, and confessional circumstances within major early modern European centers of book production persistently shaped the broader discursive landscape. The material circumstances governing the production, consumption, dissemination, and preservation of philosophical books – as commodities,

conduits of information exchange, and cultural artifacts – were all determinative of their immediate cultural impact and broader legacy throughout the Renaissance period.

The Manuscript Tradition

The locus classicus of medieval philosophical textual production was the monastic scriptorium, particularly in the greater abbeys of the Benedictines, Cistercians, and Carthusians and the major cathedral scriptoria, from about the ninth to the twelfth centuries. Close associations between the early thirteenth-century foundations of the learned mendicant orders of Franciscans and Dominicans and the advent of the municipal universities contributed to increasing traditions of scribal production within urban centers. These associations inspired the continuous production and reproduction of a canon of Scholastic texts throughout the Middle Ages that closely integrated the traditions of Aristotelian logic and metaphysics with the study of Christian theology. Their development is clearly reflected in the relatively high survival rates – across many late medieval and Renaissance cathedral, academic, and princely libraries – of the works of Anselm and Peter Lombard; the Franciscans Bonaventure, Duns Scotus, and William of Ockham; and the Dominicans Albertus Magnus and Thomas Aquinas. The concomitance of these urban court scriptoria, and the artisanal professionalization of secular scribal activity, generated substantial urban book markets and even large-scale Renaissance bookshops such as that of the Florentine stationer Vespasiano da Bisticci (d. 1498; da Bisticci 1963).

Secular scriptoria could be subject, variously, to the governance of metropolitan bishops, guilds, the authority of universities, or even all the above.

All manner of book specialists in the pay of university rectors and chancellors are described in the archival record according to their specialized skills: *cartolarii* (parchment and paper merchants), *correctores* (copy editors), *exemplatores* (copyists), *illuminatores* (illuminators), *ligatores* (binders), *rubricatores* (rubricators), *stationarii* (stationers), and so on. Some Italian, German, and French universities maintained a direct, proprietary role in the commercial production of textbooks according to a *pecia* system that endured from the thirteenth century into the era of print. Scribal exemplars of school texts officially approved by university authorities were effectively rented out to merchant booksellers (*stationarii peciarum*) who had been sworn to obey university statutes. They, in turn, would administer the secondary copying of select, numbered “pieces” (*peciae*) of the exemplar in short, serialized installments of four or more sheets (often marginally designated “*p*,” then “*p*ii**,” etc.) whose separate parts might later be stitched or bound together (Gieysztor 1992, 128). *Pecia* manuscripts were also often copied out leaving ample margins and wide interlinear blanks in order to encourage students to record their classroom *recollectae* in the form of personal manuscript annotations and glosses – a tradition that also carried over into print. Together, these specially prefabricated texts offer useful insights, not only into piecemeal contemporary philosophical book production, but also their active textual interrogation by scholars and students.

Large book fairs developed in some major urban trade centers, supplying international and cosmopolitan venues for the trade and sale of manuscript books. The most famous of these was the Frankfurt Book Fair, where manuscript books were sold at least as early as the fourteenth century and, by 1462, were joined by printed books within years of the invention of moveable type (Flood 2007). Prices for some manuscript books could be legally prescribed to protect consumers and tradesman alike, though price inflation and other market forces might also shift over time to the disadvantage of buyers, sellers, or both. During the mid-fifteenth century, Vespasiano’s Florentine scriptorium employed a wide range of

skilled copyists of texts in Latin, Greek, and perhaps even Hebrew who were capable of producing magisterial philosophical works on parchment for princes and bishops, as well as less expensive popular biographies of contemporary Italian worthies for an emerging secular readership. Even as the printing press was producing its first imprints, Vespasiano employed some 45 scribes over a period of 22 months to copy out 200 fine manuscript codices of canonical theological, literary, and philosophical texts in all branches of knowledge commissioned by Cosimo de’ Medici for the library of the Badia di Fiesole (Richardson 1999, 3).

By the end of the fifteenth century, when print succeeded in greatly overtaking scribal book manufacture in scale, volume, and cost efficiency, Abbot Johannes Trithemius of Sponheim, in his *De laude scriptorum manualium*, nevertheless continued to assert the timeless superiority of monastic scribal copying onto parchment as the ultimate mode of spiritual intellection: “The printed book is made of paper and, like paper, will quickly disappear. But the scribe working with parchment ensures lasting remembrance for himself and for his text” (Trithemius 1974). Such monastic, missionary zeal found secular echoes in Vespasiano’s corresponding, if also commercially self-serving, observation about the princely libraries that his workshop actively supplied: “All books were superlatively good and written with the pen; had there been one printed book, it would have been ashamed in such company” (Steinberg 1996). The deluxe scribal production of pious books on parchment had already long ceded priority to the idols of the marketplace; however, by the thirteenth century, book production on paper – several times cheaper than parchment – had quickly moved from its conception as a passing fashion to a permanent condition of the urban marketplace. Trithemius’s late medieval antiquarian vision would inevitably yield to the cost efficiencies inherent in printing by moveable type. These pressures helped permanently to transform the very appearance of letterforms themselves, from the familiar angular gothic of medieval theology and law texts both in manuscript and in incunabular print, to the rounded roman type

avored by humanists of the early-to-mid-sixteenth century that have endured to the present day.

The collections of urban cathedral and university manuscript libraries grew considerably throughout the later Middle Ages and early Renaissance, through internal institutional production, scribal commissions from other repositories, and the outright purchase of manuscript books in the secondary book trade. The library of the Sorbonne in Paris may have reached as many as 2000 texts by the middle of the fourteenth century (d'Amico 1988). Such riches could also be augmented locally through grants of access to substantial monastic libraries within the same city. Where the humanist Petrarch's plan to leave his considerable collection of manuscripts to the Republic of Venice had proved abortive, the Florentine Niccolò Niccoli (d. 1437) succeeded through the patronage of Cosimo de' Medici. Among his many generous bibliophilic benefactions, Cosimo commissioned the construction of a new library at the Dominican monastery of San Marco in Florence (completed in 1444) to house Niccoli's collection of some 800 Greek and Latin manuscripts. Its known contents were overwhelmingly theological in nature, however, with but a handful of classical philosophical texts in Greek. The titles included, predictably, Aristotle and Porphyry, its several Latin texts – Cicero, Seneca, and Boethius – as well as Plato's *Timaeus* and various other Aristotelian works in Latin translation (Ullman and Stadter 1972). Years later, in 1452, the example of San Marco inspired Malatesta Novello to found a magnificent municipal library at Cesena adjacent to a Franciscan convent. Its original collection of some 350 codices is largely extant and is still attached by chains to 52 separate reading desks – one of a handful of chained libraries that survive from the Renaissance period, in addition to those at Hereford Cathedral and the church of Saint Wallberg at Zutphen.

More substantial collections of classical philosophical texts, particularly in ancient Greek, began, not as the personal libraries of humanist scholars or as patrician civic benefactions, but rather as the prestigious private collections of

kings and princes. Though perhaps not as vast as the now dispersed manuscript libraries of the Aragonese kings of Naples or the Visconti-Sforza dukes of Milan, the best preserved is that of Federico da Montefeltro, duke of Urbino (d. 1482), thanks to its inspired acquisition by Alexander VII for the Vatican Library in 1657. Acquired by Federico in part from the private collections of the Florentine philosopher-magnate Palla Strozzi and long-time papal secretary Poggio Bracciolini, the majority of the Montefeltro library of nearly 900 manuscript volumes was executed either by the duke's own court scribes and illuminators or by Vespasiano da Bisticci at Florence (Simonetta 2007). Approximately one-third of the collection of some 600 Latin, 168 Greek, and 82 Hebrew manuscripts represented classical authors, including a half-dozen Greek-language codices of Plato and twice that number of Aristotle – all but exhausting the available textual sources for both ancient philosophers at the time (Stornajolo 1895).

The intervention of princes of the church took this Hellenistic scribal presence in Renaissance Italy to a still greater level, beginning substantially with the interest of pope Nicholas V in forming a permanent curial library at the Vatican open to researchers “pro communi doctorum virorum commodo” (for the common use of all learned men). Formed partly from hundreds of manuscripts already held at the Vatican, and scores more added by the pope himself, by 1455, the collection grew to as many as 1300 codices, perhaps one-third of that number representing Greek authors (Piazzoni et al. 2014). After the fall of Constantinople and Cardinal Bessarion's political exile into Italy, in 1468, he formalized his intended bequest of some 746 manuscripts (482 in Greek), envisioning for the Venetian Republic a “second Byzantium” in book form. The papal legate's collection included Greek philosophical works gathered from desiderata made known to foreign agents and scouts interested to fill gaps in the collection from as far afield as Thessalonika, Crete, and Trebizond (Labowsky 1979).

Numerous classical Greek, but especially ancient Latin, texts that were all but lost to Europe

during the Middle Ages were unearthed in the Quattrocento through the efforts of Italian “book hunters” endowed with special access to ecclesiastical libraries north of the Alps. The ultramontane excavations of the indefatigable Poggio Bracciolini and his rival Enoch of Ascoli yielded major finds at Weingarten and Reichenau, the great library of St. Gall, and Cluny in France, including several of Cicero’s orations; a complete text of Quintilian’s *Institutio oratoria*, of which Petrarch possessed only fragments; and, most momentous of all, the only known copy at the time of Lucretius’s *De rerum natura* (Bracciolini 1991). These Poggio and others copied, circulated, and thus preserved in numerous copies. As many as 50 extant Italian Renaissance copies of Lucretius survive in contemporary manuscripts indebted to Poggio’s transcription. In some cases, these “rediscovered” early manuscripts are known to have survived during the Middle Ages in just one recorded copy; in other instances, the original manuscript Poggio had consulted appears later to have been lost altogether.

Early Renaissance manuscript codices were sometimes accompanied by useful metatexts: alphabetical indexes (often appearing at the front of the text) or rudimentary tables of contents (usually enumerated as short titles on the early equivalents of title pages), running marginal glosses, and scribal colophons. However, these generally lacked the greater descriptive standards and sophistication more observable in imprints by the early sixteenth century. Only from about the 1520s onward would there appear with regularity closely documented title pages, regular foliation or pagination, and other apparatus friendly to ready reference and accurate critical citation, including terminal name and subject indexes, *addenda*, *emenda*, and *corrigenda*. Juridical restrictions resembling latter-day copyright law were almost unknown prior to the period of print. Interestingly, one of the earlier recorded statutes acknowledging a commercial interest in authorial rights of intellectual property was issued by the Republic of Florence in 1421 to the architect Filippo Brunelleschi. There is precious little evidence of the efficacy of such efforts, however, and such protections were only generally

enforceable within the jurisdictional boundaries of a particular municipality (Richardson 1999).

The Advent of Print
